No. 20101R—Law

SIX COMPANIES OF CALIFORNIA, a corporation,

Plaintiff,

vs.

JOINT HIGHWAY DISTRICT NO. 13, OF THE STATE OF CALIFORNIA, a public corporation,

Defendant.

COMPLAINT FOR MONEY

Now comes the plaintiff above named and for cause of action against the above named defendant alleges as follows, to-wit:

I

That plaintiff, Six Companies of California, was at all the dates and times herein mentioned, and still is, a corporation duly incorporated, organized and doing business as such corporation under and by virtue of the authority of the laws of the state of Nevada, and is, and at all the times herein mentioned has been, a citizen of the State of Nevada;

II

That defendant, Joint Highway District, No. 13, of the [1*] State of California, is now, and at all

*Page numbering appearing at the foot of page of original certified Transcript of Record.

the dates and times herein mentioned has been, a public corporation, duly incorporated, organized and existing under and by virtue of the authority of the laws of the State of California, and is now, and at all the dates and times herein mentioned has been, a citizen of the State of California;

III

That this proceeding is one of a civil nature and the parties were at all the dates and times herein mentioned, and still are, citizens of different states;

That the sum involved herein, exclusive of costs and interest, is in excess of $3,000.00, being the sum of $3,259,695.04;

IV

That the grounds upon which the jurisdiction of this Court depends are as follows:

(a) The existence of diversity of citizenship between the parties plaintiff and defendant as above set forth; and that said suit is of a civil nature between citizens of different states;

(b) The amount in controversy exceeds, exclusive of interest and costs, the sum of $3,000.00

V

That within two years last past, said defendant became indebted to this plaintiff in the sum of $5,280,742.15 for work done, labor performed and materials furnished by said plaintiff to said defendant, at the special instance and request of said defendant;

That no part of said sum has been paid except the sum of $2,021,047.11, and that there is now due, owing and unpaid from defendant to plaintiff on account of said work done, labor performed and materials furnished, the further sum of [2] $3,259,-695.04, and interest thereon.

Wherefore, plaintiff prays judgment against said defendant.

For a further, separate and second cause of action against said defendant, plaintiff complains and alleges:

I

Plaintiff hereby repeats and adopts each and all of the allegations hereinbefore set forth in Paragraphs I, II, III and IV of the first cause of action herein set forth, and hereby makes each and all of said allegations a part of this its second cause of action as fully as though each and all of said allegations were herein specifically repeated.

II

That within two years last past, said defendant became indebted to this plaintiff for work done, and labor performed and materials furnished by said plaintiff to said defendant of the reasonable value of $5,280,742.15, and that said sum was and is the reasonable value of said work done, labor performed and materials furnished;

That no part of said sum has been paid except the sum of $2,021,047.11, and that there is now due, owing and unpaid from defendant to plaintiff on

account of said work done, labor performed and materials furnished, the further sum of $3,259,-695. 04, and interest thereon.

Wherefore, plaintiff prays judgment against said defendant for the sum of $3,259,695.04, together with interest thereon at the rate of seven per cent. (7%) per annum from the time the respective portions thereof became due and payable, for its costs of suit incurred herein and for such other and different relief as to the Court may seem meet and proper in [3] the premises.

ETY COMPANY OF NEW YORK, a corporation, FIREMAN'S FUND INDEMNITY COMPANY, a corporation, MARYLAND CASUALTY COMPANY, a corporation, UNITED STATES FIDELITY AND GUARANTY COMPANY, a corporation, THE FIDELITY AND CASUALTY COMPANY OF NEW YORK, a corporation, GLENS FALLS INDEMNITY COMPANY, a corporation, STANDARD SURETY AND CASUALTY COMPANY OF NEW YORK, a corporation, STANDARD ACCIDENT INSURANCE COMPANY, a corporation, PACIFIC INDEMNITY COMPANY, a corporation, MASSACHUSETTS BONDING AND INSURANCE COMPANY, a corporation, CONTINENTAL CASUALTY COMPANY, a corporation, and NEW AMSTERDAM CASUALTY COMPANY, a corporation,

Cross-Defendants.

ANSWER AND CROSS-COMPLAINT OF DEFENDANT AND CROSS-COMPLAINANT JOINT HIGHWAY DISTRICT NO. 13 OF THE STATE OF CALIFORNIA. [5]

Defendant, Joint Highway District No. 13 of the State of California, a public corporation, for answer to the complaint of plaintiff on file herein, and to the first count or cause of action thereof, admits, avers, denies and alleges as follows:

I

Admits the allegations of paragraphs I, II, III and IV of the said first count or cause of action.

II

Denies that within two years last past or at any time or at all said defendant became indebted to plaintiff in the sum of $5,280,742.15 or in any other sum whatever for work done or labor performed or materials furnished or for any other matter or thing whatever done or performed or furnished by said plaintiff to the defendant at the special instance or request of said defendant or otherwise or at all.

Denies that no part of the said sum has been paid except the sum of $2,021,047.11, and in this connection said defendant expressly alleges that it has paid said plaintiff any and all sums that were or are owing or due from plaintiff to defendant, and denies there is now due or owing or unpaid from defendant to plaintiff on account of any work done or labor performed or materials furnished, or otherwise or at all, the further sum of $3,259,695.04 or interest thereon, or any sum at all in any amount whatever.

And as a Second, Separate and Further Defense to said first count said defendant alleges:

I

Alleges that on the 4th day of June, 1934, a contract in writing was duly and regularly entered into

between [6] defendant and plaintiff wherein and whereby plaintiff as contractor agreed with defendant that the said plaintiff, pursuant to the terms of said contract and for and on behalf of defendant, would construct, erect, and complete a certain project of said Joint Highway District No. 13 of the State of California, defendant herein, which project included a highway, highway tunnel and approaches with appurtenant structures, including ventilation buildings, ventilation equipment and accessories, and the construction of highway approaches with pavement, drainage structures, curbs, gutters and sidewalks where required, construction of grade separation structures, viaducts, retaining walls and incidental structures, and connections with existing streets, all as described in said contract between the said parties, which project is located within the boundaries of said defendant District and partly within the City of Oakland, County of Alameda, State of California, and partly within the County of Contra Costa, State of California, all in accordance with the final surveys, plans, specifications and detailed drawings therefor theretofore adopted by the Board of Directors of said Joint Highway District No. 13, said defendant, and which contract, plans and specifications at all times herein mentioned have been on file in the offive of said defendant District, and to which reference is hereby expressly made.

II

Upon the letting of said contract plaintiff did commence the construction of the said project and did continue with the said work, receiving each month from defendant the monthly progress payments provided for in said contract for work done during the preceding month, which payments so made by defendant to plaintiff and accepted and retained by plaintiff up to the 13th day of June, 1936, amount to $2,021,047.11. [7]

III

On the 13th day of June, 1936, and after plaintiff had been so engaged on said work for approximately a period of two years plaintiff quit and abandoned said work and refused to proceed further with the performance of said contract, and did deliver to defendant a notice of abandonment and attempted rescission in the words and figures as follows:

"June 13, 1936

Joint Highway District No. 13
Of The State of California,
1448 Webster Street,
Oakland, California.

Gentlemen:

You are hereby notified that the undersigned, Six Companies of California, has elected to and does hereby terminate and rescind the contract dated June 4, 1934, between the undersigned

and your District for the construction, erection and completion of the project of said Joint Highway District No. 13 of the State of California, which includes a highway, highway tunnels, and approaches with the appurtenant structures located partly in the City of Oakland, County of Alameda, State of California, and partly in the County of Contra Costa, State of California, commonly known as the Broadway Tunnel Project.

Said rescission is made upon the following grounds and each and all of them:

First: Through your fault the consideration for our obligations under said contract has failed in part in that you have failed and refused to pay us the amount estimated by you to be due us under the monthly estimate for work done during the month of May, 1936. Said failure consists in the deduction by you from the amount estimated by you to be due us for such work of the sum of $3,500 for claimed damages for failure to complete the work under said contract, said deduction being computed at the rate of $500 per day for each day in May 1936 following May 24th, and to and including the 31st day of May, and including such a deduction for a legal holiday, May 30, and a non-working day, Sunday, May 31st. Said deduction was and is contrary to and in violation of the terms of the contract in that we were and are entitled as a matter of right and of law to an

extension of time thereunder for performance of same to a date after May 31, 1936; and was and is further in violation of the provisions of the said contract in that any damages for delay in completion of the contract can only be asserted or claimed against the contractor for working days after the contract date for completion. [8]

Second: That the consideration for said contract has failed in a material respect in that you have breached said contract by refusing to pay us the amount due us under your monthly estimate for work done during the month of May, 1936. Said failure consists in the deduction by you from the amount due us for such work of the sum of $3,500 for claimed damages for failure to complete the work under said contract within contract time, said deduction being computed at the rate of $500 per day for each day in May, 1936 following May 24th, and to and including the 31st day of May, and including such a deduction for a legal holiday, May 30th, and a non-working day, Sunday May 31st. Said deduction was and is contrary to and in violation of the terms of the contract in that we were and are entitled as a matter of right and of law to an extension of time thereunder for performance of same to a date after May 31, 1936; and was and is further in violation of the provisions of the said contract in that any damages for delay in completion of

the contract can only be asserted or claimed against the contractor for working days after the contract date for completion.

Third: That in failing to pay said sum mentioned in numbered paragraphs First and Second above and by your refusal to grant said extension of time you have breached said contract, and ground for rescission has arisen in our favor.

Fourth: That your failure and refusal to grant us the extensions of time to which we are entitled as a matter of right and of law for completion of said contract after May 24, 1936, although we have repeatedly requested the grant of such extensions is a breach of the contract.

Fifth: Because the ground encountered in the excavation for the tunnels provided for in the contract has been and is entirely and radically different from the character of ground represented to the contractor as that which would be encountered, and which was contemplated and predicted by the contract, geological report, specifications, plans and any and all other documents forming a portion or part thereof.

Sixth: For your failure and refusal to furnish points, lines and grades for us to work to and other engineering work in the construction of the tunnels as is required to be done or furnished by you by the terms and provisions

of the contract and specifications forming a part thereof.

Seventh: Because the work which is necessarily required to be done to construct the tunnels under the ground conditions actually encountered at their site is not provided for in the contract and was not contemplated by the parties at the time the contract was made.

Eighth: For any and all other grounds of rescission of said contract of June 4, 1934 which may have heretofore existed or which do now exist in favor of the undersigned.

We are returning herewith to you your check #1934 [9] dated June 10, 1936 in purported payment of the estimate for the work done by us during the month of May, 1936.

Very truly yours,
SIX COMPANIES OF CALIFORNIA
By HENRY J. KAISER,
President."

IV.

Upon the receipt of said notice of plaintiff, defendant notified plaintiff that it considered the action of plaintiff in refusing to perform said contract an abandonment thereof, and caused notice to be served upon plaintiff to resume work within three days after the receipt of said notice or the said defendant would construe the said acts of plaintiff as a final abandonment of said contract, which said notice and letter from defendant to plaintiff are in the words and figures as follows:

"June 16, 1936

Six Companies of California
1522 Latham Square Building
Oakland, California

Gentlemen:

Your letter of June 13, 1936 in which you notified this District of a purported termination and rescission of your contract with this District dated June 4, 1934, has been received and considered by the Board of Directors of the District, and this reply thereto is made at the direction of the Directors of the District.

You are hereby advised that Joint Highway District No. 13 of the State of California considers all of the grounds stated by you as a basis for your attempted rescission and termination of the contract are without basis in fact or law; that this District has fully paid all sums required to be paid, performed and done all things required to be performed and done by it under the said contract, and that you, as such contractor, have no valid grounds or reason whatsoever for your attempted rescission and termination of the contract.

You are advised that your cessation of work upon the project and your withdrawal of workmen from the construction of the project constitutes an abandonment by you of the work to be done under the contract that your said [10] acts which unnecessarily and unreasonably delay and continue to delay the work you con-

tracted to perform, and your attempted rescission and termination of the contract, and each and all of them, constitute wilful breaches of the contract by you.

You are further advised that unless you as said contractor resume work on the project and perform the same in accordance with all of the terms thereof within three (3) days of the date of your receipt of this letter, that this District will consider your acts and conduct as aforesaid a final abandonment of the contract and the work to be done thereunder, and the District will proceed to complete the same in accordance with the provisions of the contract, and that the District will hold you and your bondsmen liable for any and all costs thereof in excess of the contract price and any and all damages to this District by reason of your wilful abandonment of the work in violation of the terms of your contract with this District dated June 4, 1934.

Yours very truly,
JOINT HIGHWAY DISTRICT No. 13
OF THE STATE OF CALIFORNIA,
By L. V. EATON,
Assistant Secretary"

V.

Plaintiff on the 13th day of June, 1936, ceased all work under said contract and on said project and ever since said date has refused and still continues to refuse to proceed further therewith.

VI.

(1) At all times herein mentioned said contract between plaintiff and defendant provided that the work to be done under said contract by plaintiff for defendant should be completed within seven hundred and twenty calendar days from and after the execution of the contract and it was stated in said contract that time was of the essence of said agreement; the said period for completion expired on May 24th, 1936.

(2) It is provided in paragraph 3 of said contract that the whole of said work is to be done by plaintiff to the satisfaction and approval of defendant and in strict accordance [11] with the plans and specifications entered into between the parties.

(3) It is further provided in paragraph 4 of said agreement that the plaintiff is skilled in the trade or calling necessary to perform the work agreed to be done under the agreement and that the defendant not being skilled in such matters relied upon the skill of plaintiff to do and perform the work and labor necessary in the most skilful and durable manner. Plaintiff also in said contract guaranteed the said work.

(4) The specifications for said work are expressly made a part of said contract.

(5) Subdivision c of Section 2 of said specifications reads as follows:

> "Examination of Plans, Specifications and Site of Work.—The bidder is required to examine carefully the site of the work, the Pro-

posal Form, and plans, specifications and contract forms for the work contemplated. The submission of a Proposal shall be considered prima facie evidence that the bidder has made such an examination and is satisfied as to the conditions to be encountered, as to the character, quality and quantities of work to be performed and materials to be furnished, and as to the requirements of the specifications, plans and contract, or contracts."

(6) Subdivision d of Section 4 of the said specifications reads as follows:

"Damages for Delay.—The parties hereto expressly stipulate and agree that time is the essence of this contract. In case the work is not completed within the time specified in the contract or within such extensions of the contract time as may be allowed as herein provided, it is distinctly understood and agreed that the Contractor shall pay the District as agreed and liquidated damages and not as a penalty five hundred dollars ($500.00) for each and every working day which may elapse between the limiting date as herein provided and the date of actual completion of the work, said sum being specifically agreed upon as a measure of damage to the District by reason of delay in the completion of the work; it being expressly stipulated and agreed that it would be impracticable to estimate and ascertain the actual dam-

ages sustained by the District under such circumstances; and the Contractor agrees and consents that the amount of such liquidated damages so fixed, shall be deducted and retained by the [12] District from any money then due, or thereafter to become due, the Contractor."

(7) Subdivision e of Section 6 of said specifications reads as follows:

"Disputes.—To prevent disputes and litigation the District Engineer shall in all cases determine the amount, quality and acceptability of the work and materials which are to be paid for under these specifications. He shall determine all questions in relation to said work and materials and performance thereof and all questions which may arise relative to the fulfillment or interpretation of these specifications on the part of the Contractor. His estimate and decision shall be final and conclusive, and in case any question shall arise between the Contractor and the District pertaining to the contract the District Engineer's estimate and decision shall be a condition precedent to the right of the Contractor to receive any moneys under the contract."

(8) Subdivision h of Section 6 of said specifications reads as follows:

"Interpretation of Plans and Specifications. —Should it appear that the work to be done or any matters relative thereto are not suffi-

ciently detailed or explained in the plans and specifications, the Contractor shall apply to the District Engineer in writing for such further details and explanations as may be necessary, and he shall conform to the same as part of the contract insofar as they may be consistent with the original specifications and plans. In the event of any doubt or question regarding the true meaning of the specifications, the decision of the District Engineer shall be final. In the event of any discrepancy between any drawing and figures written thereon, figures shall be taken as correct.

"Should the Contractor believe that any work ordered is not properly a part of his contract or according to the intent of these plans and specifications, he shall before commencing same notify the District Engineer in writing of his objections to same and shall not perform such work until notified in writing by the District Engineer as to his decision in the matter. The commencement of any such work shall act as a waiver by the Contractor of any objection he may have to the execution of such work, and as a waiver of any claim for extra work in consequence of such order.

"These specifications and plans shall be considered as supplementary one to the other, so that materials and workmanship, indicated, called for, or necessarily implied by the one

and not by the other, shall be supplied and placed in the work the same as though specifically called for by both." [13]

(9) Subdivision k of Section 6 of said specifications reads as follows:

"Contractor's Liability.—On all work the Contractor is to assume all liability of every kind or nature, arising from said work, either from accident, negligence or any cause whatsoever during the progress of the work and before the final acceptance thereof, and shall indemnify and hold the District harmless therefrom, and the bonds given by the Contractor shall hold and secure the said District free and harmless from any or all damage or expense whatsoever."

(10) Subdivision s of Section 6 of said specifications reads as follows:

"Lines and Grades.—The Contractor is to furnish free of charge all stakes necessary for marking and maintaining points and lines given by the District Engineer; and shall give the District Engineer such facilities and materials for giving said lines and points as he may require, and the District Engineer's marks must be carefully preserved.

"Sufficient points to line and grade will be set for the Contractor to work to and no additional stakes will be set. Any such stakes or

marks lost, damaged or obliterated shall be replaced at the expense of the Contractor.

"The Contractor shall do his own engineering and shall be responsible for the completion of the work to proper lines and grades in conformance with the stakes set by the District Engineer.

"The District Engineer shall be furnished facilities for the checking of lines, elevations, grades and forms at all times during the progress of the work. The Contractor shall, without charge to the District, provide openings for and suspend work that will in any way interfere with the surveys, at such times and for such periods as the District Engineer may deem necessary."

(11) The part of said specifications dealing with tunnel construction contains the following provisions:

Section 32, subdivision 3:

"Safety Rules.—The Contractor shall provide himself with copies of 'Tunnel Safety Rules' and 'General Construction Safety Orders Relating to the Storage and Use of Explosives,' together with all revisions and amendments thereto, as required by the Industrial Accident Commission of the State of California and keep copies of these at the site of the work at all times. He shall consult with officials of the In-

dustrial Accident Commission and inform himself of any and all conditions which they may require, whether set forth in [14] the published rules or specially provided for on this work. He shall thoroughly familiarize himself with the provisions of said rules and all regulations of said Commission and govern all his operations by the requirements in all particulars where the same are applicable. He shall see to it that all superintendents, foremen and other employees having responsibility for the various phases of the tunnel work are likewise familiar with the provisions referred to above, and that all work is conducted in accordance therewith. The requirements concerning ventilation, general safety precautions, transportation, roof inspection, timbering, electrical installations and use of explosives are of particular importance.

"Representatives of the U. S. Bureau of Mines and of the Industrial Accident Commission of the State of California shall be afforded free access to the work at all times and be given every facility for inspecting methods, equipment and familiarity of workmen with the various safety rules and requirements.

"All Federal and State regulations for such work of parts thereof and regulations of Counties and Municipalities having local jurisdiction shall be strictly adhered to, and authorized officials representing the Federal or State gov-

ernments or Counties or Municipalities having jurisdiction shall be given every facility for inspection and proper enforcement of rules, provisions, regulations and ordinances which may apply to the conduct of the work. The Contractor shall be responsible during the entire progress of the work for the proper enforcement of all such requirements and shall assume all liabilities which may occur due to accidents of any kind or nature. The fact that no apparent violation of rules or regulations has occurred shall not serve to relieve the Contractor of his full liability or responsibility in case of accident or damage to persons, employees, or to any part of the work.

"Provisions shall be made by the Contractor for a supply of fresh air sufficient for the safety, comfort and efficiency of all persons engaged in the tunnel construction, at all times in all portions of the work. Provision shall be made for the quick removal of gases resulting from blasting and frequent tests shall be made for harmful or explosive gases emanating from the rock structure.

"Should compliance with safety rules and regulations require special equipment the Contractor shall at all times keep on hand on the work enough of such special equipment to supply, in addition to his own requirements, complete equipment for at least three men, for the

use of the District Engineer and his assistants in inspections of the work or in giving lines and grades, or as the District Engineer may direct."

(12) Subdivision 4 of Section 32 reads as follows:

"Geological Data.—A preliminary report on the geological structures through which the tunnel will pass [15] is on file in the office of the District Engineer. This report is available for inspection by prospective bidders at the office of the District Engineer. The Board of Directors of the District and the District Engineer do not guarantee in any respect the accuracy of this report or the findings or recommendations contained therein. The fact that prospective bidders are permitted to inspect this report shall not in any respect relieve prospective bidders of their responsibility to make their own investigations as to the materials which may be encountered or the geological structures, independent and separate from those made by the District, and the Contractor shall have no claim whatsoever for damages, unexpected costs, difficulties, or for the alteration or voiding of the contract, should materials encountered vary in any respect from those indicated in the preliminary report referred to."

VII.

Subsequent to the first day of June, 1936, the District Engineer of defendant estimated and cer-

tified the amount of work done by plaintiff under the terms of said contract for the month of May, 1936, less 3500 dollars stipulated damages for delay as hereinafter alleged and the sum due the plaintiff on or before June 10, 1936 under the terms of said contract, which sum was $152,086.98, and defendant on June 10, 1936 did transmit to plaintiff the sum of $148,586.98, the amount of said estimate less the sum of $3,500.00, the said retained payment of $3,500.00 being the sum of $500.00 a day for seven working days retained by defendant as agreed and liquidated damages because the said contract had not been completed within seven hundred and twenty calendar days from the time of entering into the same. The plaintiff herein did on said 13th day of June, 1936 return the amount so paid to plaintiff by defendant, with its said purported notice of rescission.

At no time did the plaintiff demand of defendant the payment of said sum of $3,500.00 or protest against the withholding of the same, nor make upon the defendant any demand whatever therefor but instead attempted to rescind said contract as aforesaid.

At no time after the tender by defendant to plaintiff of said sum of $148,586.98 or after the plaintiff had knowledge [16] that defendant had deducted the amount of liquidated damages hereinbefore referred to did the said plaintiff request the District Engineer of defendant to make any determination on said matter or to determine the said or any other

question in relation to the said work and materials furnished by the plaintiff or the performance of said contract or to the fulfillment or interpretation of any clause in the specifications, but the said plaintiff on June 13, 1936, did serve and file its said notice attempting to rescind said contract and did entirely cease all work on said project and did refuse to continue to perform any work under said contract, and ever since has and still continues so to refuse, without making any demand whatever upon defendant District to make the said payments so withheld or to have the matter determined by the District Engineer, or to submit any matter in dispute between plaintiff and defendant to said District Engineer.

The total contract price for the performance of said work was and is a sum in excess of $3,500,000. When the said plaintiff abandoned said work the work to be performed under said contract was about seventy per cent complete.

VIII

With reference to said attempted rescission said defendant alleges as follows:

(1) Defendant retained the said sum of $3,500.00 as agreed and liquidated damages because of the failure of plaintiff to complete said contract within the specified time, and defendant at all times was ready, able and willing to submit that matter to the District Engineer for determination in accordance with the provisions of subdivision (c) of Section 6 of said specifications.

(2) With reference to the claim of rescission based [17] upon defendant's failure to grant an extension of time defendant in this connection alleges that plaintiff asked for an extension of time for one hundred and eighty days on the 10th day of June, 1935, which request was refused by defendant on the 12th day of July, 1935. Notwithstanding the refusal of defendant to grant plaintiff the requested extension of time plaintiff continued from the date of said refusal until the 13th day of June, 1936, to perform work under said contract and did receive and accept from defendant during said period of time and on account of said work sums in excess of $1,000,000.

(3) With reference to the claimed right of rescission because of an alleged claim by plaintiff of difference in underground conditions stated in said notice of June 13, 1936, defendant alleges that the underground conditions were known and ascertained by plaintiff prior to the 1st day of June, 1935, and that notwithstanding plaintiff's claim that such conditions were different from defendant's representations the plaintiff did continue to perform said contract and after full knowledge of said conditions received and accepted in excess of $1,000,000 from defendant as compensation for its work under said contract.

(4) With reference to the claimed failure of defendant to furnish points, lines and grades for the work of said plaintiff and to furnish other engineering work, defendant alleges that plaintiff as

early as the 26th day of December, 1934, made a claim to defendant with reference to said matters, and defendant's position in regard thereto, namely, that plaintiff's claim was not well founded, was communicated to plaintiff as early as the 22nd day of January, 1935; that notwithstanding plaintiff's knowledge of the position taken by defendant with reference to this claim plaintiff continued to work under said contract up to and until the 13th day of June, 1936, [18] and from the time of the first making of said claim until the cessation of work plaintiff received from defendant sums in excess of $1,400,000 in connection with its work under said contract.

With reference to all of said matters stated in said notice of rescission, at no time did plaintiff request that these or any of such be submitted to the said District Engineer of defendant in order that said District Engineer might determine any and all questions in relation to said work and materials and the performance of said contract or any and all questions which had arisen relative to the fulfillment or interpretation of specifications on the part of the plaintiff, which said specifications at all times were and now are a part of said contract. Said District Engineer was never so requested by plaintiff, nor was demand made by plaintiff upon defendant to have these matters in dispute submitted to the said District Engineer for decision.

By reason of all the foregoing plaintiff has waived any right, if it ever had any such, to re-

scind the said contract because of said matters so specified in said purported notice of rescission or any of them, and any right of plaintiff to rescind, if it ever had any such, was and is waived by acquiescence, laches and delay. At no time did plaintiff have a right to rescind said contract or any part thereof.

IX.

At no time from the time of the entering into of said contract by plaintiff until the abandonment of the said work and contract on the 13th day of June, 1936, did plaintiff before commencing any work which plaintiff claimed was not properly a part of the work under said contract, notify the District Engineer in writing of plaintiff's objection to the same and [19] refusal to perform such work until notified in writing by said Engineer of his decision in the matter, but on the contrary the said plaintiff without such written objection and without any written decision by said Engineer did continue with said work and did perform all work under said contract until the 13th day of June, 1936, when the same was abandoned by plaintiff as aforesaid.

And As A Third, Separate And Further Defense to said first count said defendant alleges:

I.

At all times herein mentioned defendant was and is a Joint Highway District of the State of California organized and existing under and by virtue

of that certain act of the Legislature of the State of California known and designated as the Joint Highway District Act. Said defendant District is and was incorporated for the purpose of constructing a project in the contract between plaintiff and defendant hereinafter mentioned specifically described, said project lying wholly within the boundaries of the said District and partly within the City of Oakland, County of Alameda, and the County of Contra Costa, State of California.

II.

Subsequent to its organization the defendant District caused final surveys, plans, specifications and detailed drawings to be prepared for said project and did include therewith the final estimate of the cost of said project, and the same were approved by the board of supervisors of each of the counties within said District, namely, the Board of Supervisors of the County of Alameda and the Board of Supervisors of the County of Contra Costa, State of California, and by the Director of the [20] Department of Public Works of the State of California, and a certified copy of said final surveys, plans, specifications and detailed drawings and of said estimated cost was transmitted to the Director of said Department of Public Works of the State of California.

III.

After the approval of said final plans and specifications as aforesaid, the defendant did cause a

notice inviting sealed proposals and bids for the construction of its said project to be published twice in a newspaper of general circulation published and circulated within the District, namely, in "The Oakland Tribune," which newspaper was designated for such purpose by the Board of Directors of said District, the first publication of which notice inviting said bids was printed and published on May 7th, 1934, and not less than ten days prior to the time fixed for receiving such bids. Pursuant to said notice bids for the construction and completion of said project were received and opened on the 22nd day of May, 1934, and the bid of plaintiff for the sum of approximately $3,683,-931.00 for the construction and completion of said project and the performance of all work in connection therewith was accepted by defendant and the contract awarded to plaintiff as the lowest responsible bidder; that plaintiff was in fact the lowest responsible bidder for said work.

IV.

Thereafter, and on the 4th day of June, 1934, pursuant to said call for bids and the bid of plaintiff and the award made to plaintiff by defendant, a contract in writing was entered into between plaintiff and defendant wherein and whereby plaintiff agreed with defendant that plaintiff pursuant to the terms of said contract and for and on behalf of defendant would [21] construct, erect and complete the said project of defendant and do and per-

form all work in connection therewith, all as described in said contract and all in accordance with the final surveys, plans, specifications and detailed drawings therefor theretofore adopted by the Board of Directors of said Joint Highway District No. 13, and which said contract, plans and specifications at all times herein mentioned have been on file in the office of the defendant District and to which reference is hereby expressly made.

V.

The said contract so let pursuant to the said bid of plaintiff included all work which was to be done in connection with said project, and no other contract with plaintiff was ever let therefor nor for any part thereof, and until said work was abandoned by plaintiff no other call for bids was ever made and no other final surveys, plans, specifications, detailed drawings or estimates for said work have been made.

VI.

Pursuant to said contract of June 4, 1934, defendant from time to time has paid plaintiff the monthly progress payments provided for in said contract and continued to make such payments up and until the 13th day of June, 1936, on which date plaintiff abandoned said contract and work and refused and still refuses to continue to perform said work or to complete the said project or any part thereof.

VII.

Said plaintiff has not been requested by defendant to perform any work except the work specified in said contract, and plaintiff has performed no other work for defendant and has made no bid for any other work. The said contract of June 4, 1934, is the sole and only contract and the sole and only understanding [22] between the plaintiff and defendant for the performance of the work specified in said contract.

VIII.

Said final surveys, plans, specifications and detailed drawings so prepared by said defendant District did include a final estimate of cost, which estimate did not exceed the estimate named in the preliminary report of the District Engineer for said project. The bid of plaintiff was within the said final estimate. The purported claim of plaintiff sued upon herein exceeds its said bid and the said final estimate by a sum greatly in excess of ten per cent of said final estimate. There has been no approval by the Board of Supervisors of any County comprising said District or of the Director of the Department of Public Works of the State of California of the said increase in costs sought to be recovered by plaintiff herein. The State of California has contributed a part of the cost of said project, namely, the sum of $700,000.

IX.

Defendant has no power nor authority to contract for construction work except as authorized by the

provisions of said Joint Highway District Act, and any attempt upon the part of said defendant District or any of its officers or employees to create a liability for construction purposes other than as in said Act provided, after public notice and call for bids, is ultra vires and void.

And As A Fourth, Separate And Further Defense to said first count and by way of counterclaim said defendant alleges:

I.

Defendant repeats and hereby incorporates as a part of this defense and counterclaim the allegations of paragraphs [23] I, II, III and IV of its third separate defense to said first count herein.

II.

Plaintiff proceeded with the work specified to be done in said contract of June 4, 1934, between the plaintiff and defendant, and continued with said work up to and including the 13th day of June, 1936, upon which date the plaintiff abandoned the said contract and the said work and then and there refused and ever since has refused to continue with the same or to further perform said agreement or any part thereof.

III.

Upon the abandonment of said contract by plaintiff it became necessary for defendant: (a) to protect and maintain said work in the unfinished state

in which it had been left upon the abandonment of said contract; (b) to measure said work in order to call for bids for the completion of the same, and to prepare and secure approval of supplemental specifications by the Department of Public Works of the State of California and the Public Works Emergency Administration of the United States for the completion of the work; (c) to readvertise for bids for such completion; and (d) to secure insurance protecting the defendant against loss by fire and against certain other hazards hereinafter mentioned.

In connection with the maintenance and protection of said work it was necessary for defendant to employ engineers, watchmen and laborers, and to secure materials, supplies and equipment. The reasonable cost of all such protection and maintenance at all times herein mentioned was and is the sum of $47944.33.

At all times herein mentioned the reasonable cost of measuring said work and of completing said specifications was [24] and is the sum of $5134.22.

In order to secure bids for new contracts to complete the work it was necessary to readvertise for such purpose, and at all times herein mentioned the reasonable cost of such advertising was and is the sum of $1862.45.

Upon such abandonment by plaintiff the defendant did secure fire insurance protecting the defendant against the hazard of fire to its property and equipment in said project, and did also secure

Workmen's Compensation and Liability insurance protecting the defendant against claims for injury to any of its employees and for damage or injury to others by reason of the operations of the defendant in maintaining and protecting said work; the reasonable cost of all said insurance at all times herein mentioned was and is the sum of $14060.85.

Said sums in this paragraph mentioned in the aggregate amount to $69001.85, and at all times herein mentioned were and are reasonable.

IV.

Said contract provided for progress payments to be made each month by defendant to plaintiff for work done during the preceding month and said contract also provided for the retention by defendant of a sum which in the aggregate should not exceed ten per cent of the contract price, said retained sum to be paid to plaintiff thirty-five days after the completion of the contract by plaintiff. Prior to said default of plaintiff, defendant had paid to plaintiff the sum of $2,021,047.11, which sum represented ninety per cent of the contract price for work done by plaintiff for defendant prior to May 1, 1936, and the defendant retained from said progress payments the sum of $224,560.79, or ten per cent of the contract price for work done prior to May 1, 1936. Plaintiff refused to accept the sums [25] tendered by defendant for work performed by plaintiff after May 1, 1936, and defendant has in its possession the sum of $265,891.82 for all work

performed by plaintiff after May 1, 1936, as per estimate and also the said sum of $224,560.79 the said retained percentage above referred to, also a credit for plaintiff of $2806.55 for partly performed work less $10,000 liquidated damages retained by defendant, said sums aggregating $493,259.16.

The reasonable cost of completing the work agreed to be done by plaintiff which remained uncompleted when plaintiff abandoned the same was and is the sum of $1,751,611.74. Said sum exceeds the sum specified in said contract of June 4, 1934, to be paid by defendant to plaintiff for such work by the sum of $591,325.47. The difference between this last mentioned amount and the sum of $483,259.16, the aggregate amount still retained by defendant for work done by plaintiff prior to the abandonment of the contract (less liquidated damages of $10,000 retained) is the sum of $108,066.31, which last mentioned sum is the reasonable increased cost of completing the work over the contract price because of plaintiff's default, less credit to plaintiff for any sums heretofore earned by plaintiff and still in defendant's possession.

V.

Under the provisions of said contract of June 4, 1934, the time when plaintiff was to complete all of the work expired on the 24th day of May, 1936, and when said work was abandoned by plaintiff on June 13, 1936, plaintiff was in default in the completion of said work for a period of twenty days.

Upon the abandonment of said work by plaintiff it became necessary for defendant to measure said work in order that it could call for bids to complete the same, to prepare and secure approval of supplemental specifications by the Department of Public Works of the State of California and the Public Works Emergency Administration of the United States for the completion of the work, and to readvertise for bids for such completion and [26] to enter into contracts therefor. The time required for all of said purposes was one hundred and forty-nine days and the said period of time was and is a reasonable time therefor, and said defendant did proceed with all reasonable dispatch and due diligence so to do.

The first new contract for the completion of the work was entered into on the 9th day of November, 1936, and the reasonable time for the completion of all said work was and is a period of two hundred and sixty-four days from and after said last mentioned date.

The periods of delay in the completing of said work caused by the default of said plaintiff are as follows: A period of twenty days from May 24, 1936, when said time for completion expired, to June 13, 1936, when plaintiff abandoned said contract; a period of one hundred and forty-nine days, the reasonable time to measure the said work remaining to be done after plaintiff's default in order to call for bids for the completion of the contract and to secure approval of supplemental specifica-

tions by the Department of Public Works of the State of California and the Public Works Emergency Administration of the United States, and to readvertise for bids for the completion of said work and to enter into the first new contract therefor; a period of two hundred and sixty-four days, the reasonable time for the completion of all said work after the entering into of said new contract. All said periods of time were and are reasonable and amount in the aggregate to four hundred and thirty-three (433) days delay in the completion of said work, all caused by the action and default of plaintiff.

VI.

It is provided in said contract of June 4, 1934, that the said contractor, plaintiff herein, shall pay to the defendant [27] as agreed and liquidated damages $500 for each and every working day which may elapse between the limiting date provided in said contract and the date of the actual completion of the work, and that said sum is specifically agreed upon between the parties as a measure of damage to the defendant by reason of delay in the completion of the work, it being expressly understood and agreed that it would be impracticable to estimate and ascertain the actual damage sustained by the defendant District because of such delay.

VII.

In this connection defendant alleges that it is and at all times herein mentioned was extremely diffi-

cult to estimate the damage which would be sustained by defendant because of any delay in the completion of the project of defendant District. The work to be done by said plaintiff for the defendant consisted of the construction of a highway tunnel and approaches and appurtenances, a portion of one of the main highways in Alameda and Contra Costa Counties; said highway connects with and is a part of the State system of highways at either extremity of said work. Said route is a main artery of travel from the San Joaquin Valley to the congested East Bay area in Alameda and Contra Costa Counties and also leading across the new bridge from the City of Oakland to the City and County of San Francisco. From a large area of the State it is a more practical, direct and safer route than any highway now in existence connecting the points above mentioned and is greatly needed by the traveling public.

Defendant's project provides a modern highway of low gradients between Walnut Creek, Contra Costa County, and the business center of Oakland, approximately one and one-half miles shorter than the Claremont Road and approximately two and one-half miles shorter than the Tunnel Road, the present highways, [28] each of which is a narrow highway of steep gradients and sharp curves and which now carry a combined traffic in excess of 1,600,000 vehicles per year, all of which traffic can be more safely and economically transported over the new route. The resulting loss, inconvenience

and damage caused by the delay in opening the project to use as a public highway is exceedingly great and is impracticable of exact ascertainment but exceeds $500 per day.

In this connection defendant further alleges that because of plaintiff's abandonment and the necessary delay required for the letting of new contracts, and because of the delay in completing said work, defendant has been and will be required until the work is completed to maintain a large staff of engineers and other employees and keep an active District organization intact, all at a reasonable cost to said District of approximately $288 a day, which cost will be entirely eliminated upon the completion of said project, which expense to defendant results solely from the delay caused by plaintiff's default in the performance of said contract. Said cost and expense in this paragraph alleged is in addition to any claim for damage specified in paragraphs III and IV of this defense and counterclaim.

Defendant has financed the cost of said project by the issuance of bonds upon which defendant must pay interest, and defendant will pay in interest for the said period of four hundred and thirty-three (433) days delay caused by the default of said plaintiff, without having the enjoyment of said project, a sum in excess of $89,832.67.

For the reasons above stated and because of the difficulty in ascertaining the actual damage, the parties agreed upon liquidated damages as aforesaid. [29]

VIII.

Defendant asserts by way of counterclaim against the said plaintiff the following: The sum of $69,-001.85, the reasonable cost of protection and measuring the work and of the other matters hereinbefore in paragraph III hereof alleged; the sum of $108,066.31, the increased reasonable cost for completing the contract abandoned by plaintiff in excess of all credits due plaintiff for work heretofore performed by plaintiff for defendant under said contract, the sum of $206,500.00 as agreed and liquidated damages; said sums amount in the aggregate to $383,568.16, and no part thereof has been paid.

And For Answer to the Second Count or Cause of Action stated in the complaint of plaintiff on file herein said defendant admits, avers, denies and alleges as follows:

I.

Denies that within two years last past or at any other time or at all said defendant became indebted to plaintiff for work done or labor performed or materials furnished by said plaintiff to said defendant, or otherwise or at all, of the reasonable or any value of $5,280,742.15, or in any other sum whatever or at all, and denies that said or any sum was or is the reasonable or any value of said work done or labor performed or materials furnished.

Denies that no part of said sum has been paid except the sum of $2,021,047.11, and in this connection said defendant expressly alleges that it has

paid said plaintiff any and all sums that were or are owing or due from defendant to plaintiff, and denies that there is now due or owing or unpaid from defendant to plaintiff on account of any work done or labor performed or materials furnished, or otherwise, or at all the [30] further sum of $3,259,-695.04 or interest thereon or any sum at all in any amount whatever.

And As A Second, Separate And Further Defense to said Second Count said defendant alleges:

I.

Defendant repeats and hereby incorporates as a part of this defense each and all of the allegations hereinbefore set forth in paragraphs I, II, III, IV, V, VI, VII, VIII and IX of its second and separate defense to the first count or cause of action of plaintiff's complaint and makes each and all of said allegations a part of this its second defense to the said second count contained in said complaint as fully as though each and all of said allegations were herein specifically repeated.

And As A Third, Separate And Further Defense to said second count said defendant alleges:

I.

Defendant repeats and hereby incorporates as a part of this defense each and all of the allegations hereinbefore set forth in paragraphs I, II, III, IV, V, VI, VII, VIII and IX of its third and separate

defense to the first count or cause of action of plaintiff's complaint and makes each and all of said allegations a part of this its third defense to the said second count contained in said complaint as fully as though each and all of said allegations were herein specifically repeated.

And As A Fourth, Separate And Further Defense to said second count and by way of counterclaim said defendant alleges:

I.

Defendant repeats and hereby incorporates as a part [31] of this defense and counterclaim the allegations of paragraphs I, II, III and IV of its third and separate defense to said first count herein and makes each and all of said allegations a part of this its fourth separate and further defense and counterclaim to the said second count contained in said complaint as fully as though each and all of said allegations were herein specifically repeated.

II.

Defendant repeats and hereby incorporates as a part of this defense and counterclaim the allegations of paragraphs II, III, IV, V, VI, VII and VIII of its fourth, separate and further defense and counterclaim to the first count or cause of action stated in plaintiff's complaint and makes each and all of said allegations a part of this its fourth, separate and further defense and counterclaim to said second count contained in said complaint as fully

as though each and all of said allegations were herein specifically repeated. [32]

CROSS-COMPLAINT

Without waiving any of the allegations of its answer herein and by way of cross-complaint, said defendant complains of plaintiff and cross-defendant, and of each and every of the above named cross-defendants, and for cause of action alleges:

I.

Defendant and cross-complainant, Joint Highway District No. 13 of the State of California, at all the dates and times herein mentioned was and is now a public corporation duly organized and existing under and by virtue of the laws of the State of California, particularly that certain act known and designated as the Joint Highway District Act.

II.

Plaintiff and cross-defendant, Six Companies of California, at all the dates and times herein mentioned was and is now a corporation duly incorporated, organized and existing under and by virtue of the law of the State of Nevada.

III.

Each of the cross-defendants hereinafter mentioned, at all the dates and times herein mentioned, was and is now a corporation duly incorporated,

organized and existing under and by virtue of the laws of one of the several states of the Union as hereinafter in this paragraph respectively designated for each of said respective cross-defendants:

(a) Hartford Accident and Indemnity Company, a Connecticut corporation;

(b) Fidelity and Deposit Company of Maryland, a Maryland corporation;

(c) The Aetna Casualty and Surety Company, a Connecticut corporation; [33]

(d) Indemnity Insurance Company of North America, a Pennsylvania corporation;

(e) American Surety Company of New York, a New York corporation;

(f) Fireman's Fund Indemnity Company, a California corporation;

(g) Maryland Casualty Company, a Maryland corporation;

(h) United States Fidelity and Guaranty Company, a Maryland corporation;

(i) The Fidelity and Casualty Company of New York, a New York corporation;

(j) Glens Falls Indemnity Company, a New York corporation;

(k) Standard Surety And Casualty Company of New York, a New York corporation;

(l) Standard Accident Insurance Company, a Michigan corporation;

(m) Pacific Indemnity Company, a California corporation;

(n) Massachusetts Bonding And Insurance Company, a Massachusetts corporation;

(o) Continental Casualty Company, an Indiana corporation;

(p) New Amsterdam Casualty Company, a New York corporation.

IV.

On the 4th day of June, 1934, a contract in writing was entered into between Six Companies of California, a corporation, plaintiff herein, and defendant, wherein and whereby plaintiff agreed with defendant that the plaintiff pursuant to the terms [34] of said contract and for and on behalf of defendant would construct, erect and complete the project of the defendant in said contract specifically described and do and perform all work in connection therewith, all as more fully described in said contract and all in accordance with the final surveys, plans, specifications and detailed drawings therefor theretofore adopted by the Board of Directors of said defendant Joint Highway District No. 13, and which said contract, plans and specifications at all times herein mentioned have been on file in the office of the defendant District and to which reference is hereby made.

V.

Plaintiff as said contractor did, upon the delivery of said contract to the defendant, deliver with said contract and annexed thereto a certain bond for the

faithful performance of said contract, which bond was executed by the plaintiff and cross-defendant and by each of the other cross-defendants above mentioned. Said bond when delivered was annexed to said contract and was a part thereof.

The bond above referred to, so made, executed and delivered by the plaintiff and cross-defendant and by each and every of the other cross-defendants to the defendant and cross-complainant herein, is hereto attached marked Exhibit "A" and expressly made a part hereof for all purposes.

VI.

Plaintiff proceeded with the work specified to be done in said contract between plaintiff and defendant and continued with said work up to and including the 13th day of June, 1936, upon which date the plaintiff abandoned the said contract and the said work and then and there refused, and ever since has refused, to continue with the same or to further perform said agreement or any part thereof. [35]

VII.

Upon the abandonment of said work defendant notified plaintiff and cross-defendant and each of the other cross-defendants that it considered the action of plaintiff in refusing to perform said contract an abandonment thereof, and said defendant and cross-complainant caused notice to be served upon plaintiff and cross-defendant and upon each and every of the other cross-defendants to resume

work within three days after the receipt of said notice or the said defendant would construe said acts of the plaintiff as a final abandonment of said contract; a copy of which said notice so delivered to the plaintiff and cross-defendant and to all of the other cross-defendants herein is hereinbefore set forth in paragraph IV of defendant's second, separate and further defense to the first count of the complaint of plaintiff on file herein, to which reference is hereby expressly made.

VIII.

Notwithstanding the receipt of said notice by said plaintiff and cross-defendant and by each of the other cross-defendants the said plaintiff and cross-defendant, and each of the other cross-defendants, then and there refused and ever since have refused to continue with the said work or to further perform said contract or any part thereof or any of the work thereunder.

IX.

Upon the abandonment of said contract by plaintiff it became necessary for defendant: (a) to protect and maintain said work in the unfinished state in which it had been left upon the abandonment of said contract; (b) to measure said work in order to call for bids for the completion of the same and to prepare and secure approval of supplemental specifications by the Department of Public Works of the State of California and the [36] Public Works Emergency Administration of the United

States for the completion of the work; (c) to readvertise for bids for such completion. and (d) to secure insurance protecting the defendant against loss by fire and against certain other hazards hereinafter mentioned.

In connection with the maintenance and protection of said work it was necessary for defendant to employ engineers, watchmen and laborers, and to secure materials, supplies and equipment. The reasonable cost of all such protection and maintenance at all times herein mentioned was and is the sum of $47,944.33.

At all times herein mentioned the reasonable cost of measuring said work and of completing said specifications was and is the sum of $5,134.22.

In order to secure bids for new contracts to complete the work it was necessary to readvertise for such purpose, and at all times herein mentioned the reasonable cost of such advertising was and is the sum of $1,862.45.

Upon such abandonment by plaintiff the defendant did secure fire insurance protecting the defendant against the hazard of fire to its property and equipment in said project, and did also secure Workmen's Compensation and Liability insurance protecting the defendant against claims for injury to any of its employees and for damage or injury to others by reason of the operations of the defendant in maintaining and protecting said work; the reasonable cost of all of said insurance at all times

herein mentioned was and is the sum of $14,060.85.

Said sums in this paragraph mentioned in the aggregate amount to $69,001.85, and at all times herein mentioned were and are reasonable. [37]

X.

Said contract provided for progress payments to be made each month by defendant to plaintiff for work done during the preceding month and said contract also provided for the retention by defendant of a sum which in the aggregate should not exceed ten per cent of the contract price, said retained sum to be paid to plaintiff thirty-five days after the completion of the contract by plaintiff. Prior to said default of plaintiff, defendant had paid to plaintiff the sum of $2,021,047.11, which sum represented ninety per cent of the contract price for work done by plaintiff for defendant prior to May 1, 1936, and the defendant retained from said progress payments the sum of $224,560.79, or ten per cent of the contract price for work done prior to May 1, 1936. Plaintiff refused to accept the sums tendered by defendant for work performed by plaintiff after May 1, 1936, and defendant has in its possession the sum of $265,891.82 for all work performed by plaintiff after May 1, 1936, as per estimate and also the said sum of $224,560.79 the said retained percentage above referred to, also a credit for plaintiff of $2,806.55 for partly performed work said sums aggregating $493,259.16 less liquidated damages of $10,000 retained by defendant.

The reasonable cost of completing the work agreed to be done by plaintiff which remained uncompleted when plaintiff abandoned the same was and is the sum of $1,751,611.74. Said sum exceeds the sum specified in said contract of June 4, 1934, to be paid by defendant to plaintiff for such work by the sum of $591,325.47. The difference between this last mentioned amount and the sum of $483,-259.16, the aggregate amount still retained by defendant for work done by plaintiff prior to the abandonment of the contract (less liquidated damages of $10,000 retained) is the sum of $108,066.31, which last mentioned sum is the reasonable increased cost of completing the work over the contract price because of plaintiff's default, less credit to plaintiff for any sums heretofore earned by [38] plaintiff and still in defendant's possession.

XI.

Under the provisions of said contract of June 4, 1934, the time when plaintiff was to complete all of the work expired on the 24th day of May, 1936, and when said work was abandoned by plaintiff on June 13, 1936, plaintiff was in default in the completion of said work for a period of twenty days.

Upon the abandonment of said work by plaintiff it became necessary for defendant to measure said work in order that it could call for bids to complete the same, to prepare and secure approval of supplemental specifications by the Department of Public Works of the State of California and the

Public Works Emergency Administration of the United States for the completion of the work, and to readvertise for bids for such completion and to enter into contracts therefor. The time required for all of said purposes was one hundred and forty-nine days and the said period of time was and is a reasonable time therefor, and said defendant did proceed with all reasonable dispatch and due diligence so to do.

The first new contract for the completion of the work was entered into on the 9th day of November, 1936, and the reasonable time for the completion of all said work was and is a period of two hundred and sixty-four days from and after said last mentioned date.

The periods of delay in the completing of said work caused by the default of said plaintiff are as follows: A period of twenty days from May 24, 1936, when said time for completion expired, to June 13, 1936, when plaintiff abandoned said contract; a period of one hundred and forty-nine days, the reasonable time to measure the said work remaining to be done after plaintiff's default in order to call for bids for the completion of the contract and to secure approval of supplemental [39] specifications by the Department of Public Works of the State of California and the Public Works Emergency Administration of the United States, and to readvertise for bids for the completion of said work and to enter into the first new contract therefor; a period of two hundred and sixty-four days, the

reasonable time for the completion of all said work after the entering into of said new contract. All said periods of time were and are reasonable and amount in the aggregate to four hundred and thirty-three (433) days delay in the completion of said work, all caused by the action and default of plaintiff.

XII.

It is provided in said contract of June 4, 1934, that the said contractor, plaintiff herein, shall pay to the defendant as agreed and liquidated damages $500 for each and every working day which may elapse between the limiting date provided in said contract and the date of the actual completion of the work, and that said sum is specifically agreed upon between the parties as a measure of damage to the defendant by reason of delay in the completion of the work, it being expressly understood and agreed that it would be impracticable to estimate and ascertain the actual damage sustained by the defendant District because of such delay.

XIII.

In this connection defendant alleges that it is and at all times herein mentioned was extremely difficult to estimate the damage which would be sustained by defendant because of any delay in the completion of the project of defendant District. The work to be done by said plaintiff for the defendant consisted of the construction of a highway tunnel and approaches and appurtenances, a portion

of one of the main highways in Alameda and Contra Costa Counties; said highway connects with and is a part [40] of the State system of highways at either extremity of said work. Said route is a main artery of travel from the San Joaquin Valley to the congested East Bay area in Alameda and Contra Costa Counties and also leading across the new bridge from the City of Oakland to the City and County of San Francisco. From a large area of the State it is a more practical, direct and safer route than any highway now in existence connecting the points above mentioned and is greatly needed by the traveling public.

Defendant's project provides a modern highway of low gradients between Walnut Creek, Contra Costa County, and the business center of Oakland, approximately one and one-half miles shorter than the Claremont Road and approximately two and one-half miles shorter than the Tunnel Road, the present highways, each of which is a narrow highway of steep gradients and sharp curves and which now carry a combined traffic in excess of 1,600,000 vehicles per year, all of which traffic can be more safely and economically transported over the new route. The resulting loss, inconvenience and damage caused by the delay in opening the project to use as a public highway is exceedingly great and is impracticable of exact ascertainment but exceeds $500 per day.

In this connection defendant further alleges that because of plaintiff's abandonment and the neces-

sary delay required for the letting of new contracts, and because of the delay in completing said work, defendant has been and will be required until the work is completed to maintain a large staff of engineers and other employees and keep an active District organization intact, all at a reasonable cost to said District of approximately $272.89 a day, which cost will be enfirely eliminated upon the completion of said project, which expense to defendant results solely from the delay caused by plaintiff's default in [41] the performance of said contract. Said cost and expense in this paragraph alleged is in addition to any claim for damage specified in paragraphs IX and X of this cross-complaint.

Defendant has financed the cost of said project by the issuance of bonds upon which defendant must pay interest, and defendant will pay in interest for the said period of four hundred and thirty-three (433) days delay caused by the default of said plaintiff, without having the enjoyment of said project, a sum in excess of $89,832.67.

For the reasons above stated and because of the difficulty in ascertaining the actual damage the parties agreed upon liquidated damages as aforesaid.

XIV.

The aggregate damages above referred to which defendant claims by way of cross-complaint are as follows: the sum of $69,001.85, the reasonable cost of protecting and measuring the work and of the other matters hereinbefore in paragraph IX hereof

alleged; the sum of $108,066.31, the increased reasonable cost for completing the contract abandoned by plaintiff in excess of all credits due plaintiff for work heretofore performed by plaintiff for defendant under said contract, as hereinbefore in paragraph X hereof alleged, and the sum of $206,500.00 as agreed and liquidated damages; said sums amount in the aggregate to $383,568.16, and no part thereof has been paid.

Wherefore, defendant and cross-complainant prays judgment as follows:

(a) That plaintiff take nothing by its said complaint;

(b) That defendant and cross-complainant have judgment against the plaintiff and cross-defendant for the sum of [42] $383,568.16, the aggregate amount of damages sustained by defendant and cross-complainant because of the default of said plaintiff and cross-defendant as aforesaid;

(c) That defendant and cross-complainant have judgment against each and every of the other cross-defendants for the proportion of the said sum of $383,568.16 represented by the respective percentages of liability assumed by each of said other cross-defendants on the said bond given by such cross-defendants collectively for the faithful performance of said contract upon the part of the plaintiff;

(d) For such other, further and additional relief as may be meet and proper; and

(e) For defendant and cross-complainant's costs of suit herein incurred.

ARCHIBALD B. TINNING,
T. P. WITTSCHEN,
Attorneys for Defendant and Cross-Complainant. [43]

State of California,
County of Contra Costa—ss.

Harry M. Stow, being duly sworn, deposes and says:

That he is and was at all the dates and times herein mentioned an officer, to-wit, the Secretary, of Joint Highway District No. 13 of the State of California, a public corporation, defendant and cross-complainant herein; that he has read the foregoing Answer and Cross-Complaint and knows the contents thereof and that the same is true of his own knowledge except as to the matters therein stated on information and belief, and as to those matters he believes it to be true; that he makes this verification for and on behalf of said defendant and cross-complainant.

HARRY M. STOW,

Subscribed and sworn to before me this 16th day of December, 1936.

[Notarial Seal] ELIZABETH KING,
Notary Public in and for the County of Contra Costa, State of California. [44]

[Clerk's Note: Exhibit A to Cross Complaint is here omitted as same is set out as Plaintiff's Exhibit 18 in the Book of Exhibits.]

[Title of District Court and Cause.]

ANSWER TO CROSS-COMPLAINT

Comes, now, Six Companies of California, plaintiff and cross-defendant above named, and answers the cross-complaint on file herein by defendant and cross-complainant, and admits, denies and alleges as follows:

I.

Admits the allegations contained in paragraph I, II [54] and III of the cross-complaint.

II.

Answering the allegations contained in paragraph IV of the cross-complaint admits that a contract in writing was entered into between plaintiff and defendant on the 4th day of June, 1934, but denies each and all the remaining allegations in said paragraph contained, commencing with the word "wherein" on line 30 of page 30 of the cross-complaint to and including the end of said paragraph on line 10 on page 31 of the cross-complaint.

III.

Admits the allegations contained in paragraph V of the cross-complaint.

IV.

Answering the allegations contained in paragraph VI of said cross-complaint plaintiff denies that on June 13th, 1936, or at any time, or at all, it abandoned said contract, or the work to be done thereunder. In this connection plaintiff alleges that on

June 13th, 1936, plaintiff, for good and sufficient reasons and in accordance with law, as hereinafter more specifically stated, duly rescinded said contract and that since said date plaintiff has done no work under said contract.

V.

Answering the allegations contained in paragraph VII of the cross-complaint denies each and all, generally and specifically the allegations in said paragraph contained, save and except that plaintiff admits a notice was sent in the form stated in said paragraph by defendant to plaintiff.

VI.

Answering the allegations contained in paragraph VIII of said cross-complaint, plaintiff admits that, after rescinding said contract on June 13th, 1936, it has refused further to perform the same or do any work thereunder and denies generally [55] and specifically each and every other allegation in said paragraph contained.

VII.

Answering the allegations contained in paragraph IX of said cross-complaint, plaintiff denies that it ever abandoned said contract and alleges that it has no information or belief concerning the other matters or allegations set forth in said paragraph and placing its denial on that ground denies generally and specifically each and every of said other matters or allegations and statements of fact in said paragraph contained.

VIII.

Answering the allegations contained in paragraph X of said cross-complaint plaintiff admits the allegation commencing with the word "said" in line 2 and ending with the word "plaintiff" in line 8; denies the allegations contained in said paragraph commencing with the word " prior" in line 8 and ending with the figures "1936" in line 14, except that plaintiff admits that it has received from defendant the sum of $2,021,047.11 and defendant has retained at least the sum of $224,560.79. Plaintiff admits the allegations contained in said paragraph commencing with the word "plaintiff" in line 14 and ending with the figures "490,452.61" in line 19, except that the amounts therein are less than the full amount of money due and payable from defendant to plaintiff for work done by plaintiff for defendant, as more particularly hereinafter in this answer alleged.

Further answering the allegations contained in paragraph X of said cross-complaint, plaintiff denies that the reasonable cost of completing the work described in said contract between it and defendant was or is the amount of $1,725,000.00 or, as plaintiff is informed and believes and accordingly alleges, any other sum in excess of the amount of approximately $1,000,000.00 [56] However, plaintiff does not admit or deny that the cost of completing the project of defendant is or will be $1,725,000.00 and in this connection plaintiff alleges that it never agreed, in said contract, or otherwise,

to construct the tunnels being constructed as a part of said project in the manner in which it is necessary in fact to construct the same, because of the conditions of the ground in which the same are being constructed, and that any cost of completing the project of said defendant in excess of the amount of approximately $1,000,000.00 is due to the fact that said tunnels are being, and because of the nature of the ground, must be, constructed in a manner radically different from that specified in said contract and the plans and specifications forming a part thereof.

Further answering the allegations of said paragraph plaintiff, except as hereinbefore expressly admitted, denies generally and specifically each and every allegation in said paragraph contained.

IX.

Answering the allegations contained in paragraph XI of the cross-complaint, denies each and all, generally and specifically, the allegations in said paragraph contained, save and except plaintiff admits it will take 264 days from the commencement of such work to complete the remainder of the construction of the project described in the answer and cross-complaint.

X.

Answering the allegations contained in paragraph XII of said cross-complaint, plaintiff alleges that said contract provides as follows:

"Section 4. Time

"(a) Commencement of Work.—The Contractor shall commence work within ten (10) days after the execution of the contract for the work by the Board of Directors and shall continue without interruption unless otherwise directed by the [57] District. At least three (3) days before starting, the Contractor shall notify the District Engineer in writing of the date that work is to commence.

"(b) Completion of Work.—The time of completion of the entire work specified herein shall be within a period of seven hundred and twenty (720) calendar days from the date of the execution of the contract by the Board of Directors.

"(c) Extension of Time.—The time during which the Contractor is delayed in said work by Acts of God, or by stormy or inclement weather, or by any reason which, in the judgment of the District Engineer, unavoidably delays the work, shall be added to the aforesaid time for completion, provided that the Board of Directors approve in advance the written application therefor, which must be made by the Contractor for such an extension, before the expiration of the time limit fixed herein, or a duly granted extension thereof.

"(d) Damages for Delay.—The parties hereto expressly stipulate and agree that time is the essence of this contract. In case the work is not completed within the time specified in the con-

tract or within such extensions of the contract time as may be allowed as herein provided, it is distinctly understood and agreed that the Contractor shall pay the District as agreed and liquidated damages and not as a penalty five hundred dollars ($500.00) for each and every working day which may elapse between the limiting date as herein provided and the date of actual completion of the work, said sum being specifically agreed upon as a measure of damage to the District by reason of delay in the completion of the work; it being expressly stipulated and agreed that it would be impracticable to estimate and ascertain the actual damages sustained by the District under such circumstances. and the Contractor agrees and consents that the amount of such liquidated damages so fixed, shall be deducted and retained by the District from any money then due, or thereafter to become due, the Contractor."

Plaintiff denies each and every allegation in said paragraph inconsistent with the provision of said contract quoted in this paragraph of this answer.

XI.

Answering the allegations of paragraph XIII of said cross-complaint, plaintiff denies all of the allegations contained in the first four lines of said paragraph; denies that the resulting, or any loss, or inconvenience, or delay in opening said project to use as a public highway is exceedingly [58] great, or is great at all, and denies that any such loss is imprac-

ticable of exact ascertainment or that it exceeds $500.00 per day or any other sum of money whatever and in this connection plaintiff alleges that defendant has suffered no loss through any delay in completing said project which may not be exactly ascertained.

Further answering the allegations contained in said paragraph, plaintiff denies that it abandoned said contract, or the work to be done thereunder, or that there was necessary any delay in letting new contracts, or that because of delay in completing the work defendant has been, or will be, required to maintain a large, or any, staff of engineers or other employees, or any engineers, or employees whatever, or keep an active District organization intact at a reasonable, or other, cost to said defendant of $288.00 per day, or any other sum of money whatever; denies that on completion of the project of defendant all such costs will be eliminated; denies that any expense of defendant results, or has resulted, solely, or otherwise, from any delay caused by plaintiff's default or any delay caused by plaintiff at all in the performance of said contract, or otherwise, or at all; denies that defendant must, or will, pay interest on any bonds referred to in said cross-complaint, or otherwise, for the period of 433 days, or for any period of time whatsoever on account of any delay caused by any default of plaintiff, or otherwise caused by plaintiff, in the amount of $82,000.00 or in any other amount whatsoever; denies that there was any delay in the construction of said project caused by any default of plaintiff.

Plaintiff denies all of the allegations contained in lines 10 to 12 inclusive, on page 38, of said cross-complaint.

XII.

Answering the allegations contained in paragraph XIV of the cross-complaint denies each and all, generally and specifically the allegations in said paragraph contained. [59]

For a second, separate and further defense to said cross-complaint, plaintiff alleges:

I.

That heretofore and on or about the 4th day of May, 1934, defendant advertised for bids to be made to it for the construction of the project described in the answer and cross-complaint, and invited bidders to submit bids therefor based upon the notice to bidders, plans, specifications and geological report furnished to bidders or made available to bidders in connection with any bid made; and that pursuant to said notice to bidders and based upon the representations to bidders contained in the plans and specifications and geological report, plaintiff submitted a bid for the doing of the work described in the notice to bidders aforesaid.

Thereafter the bid of plaintiff was duly accepted and a contract in writing entered into between plaintiff and defendant pursuant to the bid made by plaintiff, to which contract reference is hereby made for a full statement of the details thereof, and to the documents referred to therein for a full state-

ment of the details of same, with the same force and effect as if same were set forth in this answer, it being impracticable to fully set forth true copies of said contract and all documents referred to in the notice to bidders, plans and specifications as a part of this answer, and same being readily available in the records of defendant, which is a public corporation.

Plaintiff was induced to bid, and did bid solely upon the representations contained in the plans, specifications and geological report to which the attention of bidders was invited; and plaintiff relied upon all the representations therein contained in making its bid and in entering into a contract with the defendant pursuant to such bid, and would not have made said bid or entered into such contract, except for the [60] representations contained in the plans, specifications and geological report.

II.

That in and by the plans and specifications, and the geological report it was represented by defendant to plaintiff that the tunnels described therein would be driven through ground which was self-supporting in character for ninety percent or more of the total length of said tunnels, and which could be constructed and would be required to be constructed with the use only of temporary timber supports for the excavation of said tunnels which would be removed before the installation therein of the concrete lining or permanent structure thereof pro-

vided to be built therein under the plans and specifications.

That in truth and in fact said representations were false in that the entire length of the tunnels to be constructed was in ground which was not self-supporting, and which required permanent timbering or other support until and after the installation therein of the permanent concrete lining or structure thereof, and required all of the support placed therein prior to permanent lining to remain without removal from said tunnels.

III.

After entering into said contract with defendant, as aforesaid, plaintiff commenced work thereunder, and undertook the construction of said tunnels under and in accordance with the plans and specifications and in the belief that the representations contained in the plans and specifications and the geological report were true and correct. As the construction of said tunnels progressed, plaintiff found that the ground through which same were being driven was not self-supporting, and that all temporary support for the excavation for same was required of necessity to remain permanently. [61]

IV.

By reason of the character of ground encountered in the excavation and construction of said tunnels as aforesaid, plaintiff was necessarily required to and did expend large sums of money for labor to excavate and construct said tunnels in excess of that which would have been spent by plaintiff in the

event the construction of same could have been performed in accordance with the representations made as aforesaid, and also was compelled to and did expend large sums for materials and for the proper prosecution of the work in excess of what would otherwise have been necessary.

V.

It was never within the contemplation of said contract or of the parties to it that said tunnels should be constructed in said manner or through ground of the character and type actually encountered and plaintiff was not, therefore, obligated or required by said contract to so construct said tunnels and is entitled to recover from defendant the reasonable value of the work done by it in constructing said tunnels and a reasonable profit.

VI.

That for the reason, among others, that the condition of said ground had been misrepresented by defendant to plaintiff, as hereinbefore stated and that the work of constructing said tunnels was so radically different from that required by the contract, plaintiff, on June 13th, 1936, rescinded said contract and delivered to defendant the notice of rescission a copy of which is set forth in paragraph III of defendant's second, separate and further defense to the first count of the complaint herein.

Upon said delivery of said notice of rescission plaintiff ceased all work on said project and has not since [62] performed any work thereon and said contract thereupon was rescinded.

For a third and further and separate defense to said cross-complaint, plaintiff alleges:

I.

Plaintiff here repeats and incorporates as a part of this defense the allegations of paragraphs I to VI, inclusive, of its second defense hereinabove in this answer set forth.

II.

The ground condition aforesaid was understood by both plaintiff and defendant and contemplated by both of them to be in accordance with the plans and specifications and the representations contained therein and in the geological report referred to therein; and said contract was entered into in the contemplation by both parties that self-supporting ground would be encountered in the excavation and construction of the tunnels for ninety per cent, or more, of the length thereof, all as hereinbefore alleged; and each party to said contract was mistaken as to the true facts; and by reason of such mistake plaintiff was relieved of any obligation further to perform said contract, and was entitled to rescind and did rescind same in accordance with its notification to defendant to that effect on June 13th, 1936.

For a fourth and further and separate defense to said cross-complaint, plaintiff alleges:

I.

Plaintiff here repeats and incorporates as a part of this defense the allegations of paragraphs I to

VI, inclusive of its second defense hereinabove in this answer set forth. [63]

II.

That plaintiff was ignorant of, and mistaken as to, the ground condition to be encountered in the construction of the tunnels as aforesaid at the time it entered into said contract with defendant; but defendant, so plaintiff is informed and believes and therefore alleges, had knowledge of facts and circumstances from which it knew or should or could have known or suspected at said time that the ground through which the tunnels would be driven was not in fact self-supporting either for ninety per cent of the length of the said tunnels, or any part thereof, but was in truth and in fact not self-supporting for the entire length of said tunnels. That defendant falsely and fraudulently failed and neglected to inform and acquaint plaintiff with such facts and circumstances. For said reasons plaintiff entered into said contract with defendant solely by reason of the fraud of defendant as hereinbefore stated, and by reason of such fraud plaintiff was relieved of any obligation further to perform said contract and was entitled to rescind same in accordance with its notification to defendant to that effect on June 13th, 1936.

For a fifth and further and separate defense to said cross-complaint, plaintiff alleges:

I.

Plaintiff here repeats and incorporates as a part of this defense the allegations of paragraphs I to

VI, inclusive, of its second defense hereinabove in this answer set forth.

II.

By reason of the difference in ground conditions [64] encountered in the construction of said tunnels as aforesaid, and of the radically different character of the work required to be done by plaintiff under the contract as a result of such different ground condition, the doing, performance or construction of the work contracted for under the contract, plans and specifications became and was in fact impossible in that the facts and premises upon which said contract was based were of a character that the assumed work to be done and conditions to be found turned out not to exist, and thereby plaintiff was called upon to and did work of such different character to that contemplated that in truth and in fact no contract ever existed for the work done by plaintiff.

For a sixth, separate and further defense to said cross-complaint, plaintiff alleges:

I.

In said contract dated June 4th, 1934, between plaintiff and defendant, referred to in plaintiff's second defense, it is provided that the District Engineer of defendant would give plaintiff sufficient points and lines to enable plaintiff to construct said project in accordance with said contract and said plans and specifications and that defendant would

set sufficient points to line and grade for plaintiff to work to.

II.

Shortly after the commencement of construction operations under said contract, and repeatedly thereafter, plaintiff demanded of the then duly appointed and acting District Engineer of defendant and of defendant that said Engineer set the necessary points and determine the necessary [65] lines to enable plaintiff to construct said project as required by said contract. That notwithstanding said demands of plaintiff said Engineer failed and refused, and has at all times failed and refused, to set said points, or establish said lines, or any of them, and the refusal of said Engineer so to do was ratified and approved by defendant.

III.

Said refusal of said Engineer and defendant to establish said lines and set said points is, and was, a breach of said contract and for that reason, among others, plaintiff, on June 13th, 1936, delivered to defendant the notice of rescission of said contract referred to in plaintiff's second defense and rescinded said contract.

For a seventh, separate and further defense to said cross-complaint, plaintiff alleges:

I.

Said contract, dated June 4th, 1934, between plaintiff and defendant, referred to in plaintiff's second defense herein provides, in part, as follows:

"(b) Completion of Work.—The time of completion of the entire work specified herein shall be within a period of seven hundred and twenty (720) calendar days from the date of the execution of the contract by the Board of Directors.

"(c) Extension of Time.—The time during which the Contractor is delayed in said work by Acts of God, or by stormy or inclement weather, or by any reason which, in the judgment of the District Engineer, unavoidably delays the work, shall be added to the aforesaid time for completion, provided that the Board of Directors approve in advance the written application therefor, which must be made by the Contractor for such an extension, before the expiration of the time limit fixed herein, or a duly granted extension thereof."

Said contract further purports to provide that plaintiff will pay to defendant as liquidated damages the amount of $500.00 per day for each and every working day that elapses between the [66] limiting date provided in the contract and the date of actual completion of the work.

Said contract further provides, in part, as follows:

"7. Payments for said work will be made only upon the certificate of the District Engineer for work actually performed. The District Engineer shall measure the work on or about the first day of each month and at the time of completion of the entire work, and shall render a certificate on or about the tenth day of each month and

at the completion of the entire work, stating the amount of work performed during the previous calendar month, and during the current month, at the time of completion. The Contractor shall then, at the times above specified, be entitled to receive a payment from the District in an amount to be determined as follows: Until the total value of the work done since commencement of performance of the contract exceeds Four Hundred Thousand Dollars ($400,000.00) the payment will be seventy-five per cent (75%) of the amount specified in the District Engineer's certificate; thereafter and until the total value of the work done since the commencement of performance of the contract equals One Million Dollars ($1,000,000.00), the constant sum of One Hundred Thousand Dollars ($100,000.00) will be retained by the District out of said total value; thereafter the progress payment will be ninety per cent (90%) of the amount specified in the Engineer's certificate, provided that no such estimate of payment shall be required to be made when, in the judgment of the District Engineer, the work is not proceeding in accordance with the provisions of the contract, or when, in his judgment, the total value of the work done since the last estimate amounts to less than Five Hundred Dollars ($500.00), except the certificate and payment required at the completion of the entire work."

II.

Said contract was executed by the Board of Directors of defendant on June 4th, 1934.

III.

On June 10th, 1935, plaintiff applied to defendant in writing for an extension of time within which to complete the work.

By letter dated July 12th, 1935, addressed to plaintiff, defendant denied said request for an extension of time.

By letter dated July 26th, 1935, from plaintiff to defendant, plaintiff protested said denial and reaffirmed its request for such extension.

By letter to defendant dated August 28th, 1935, plaintiff [67] again demanded an extension of time sufficient to enable it to complete the work.

By letter to defendant dated May 8th, 1936, plaintiff again made written application for an extension of time.

By letter from defendant to plaintiff dated May 14th, 1936, defendant denied said request for an extension of time.

In addition, plaintiff on many other occasions prior to May 24th, 1936, requested the District Engineer of defendant and requested defendant to grant to plaintiff an extension of time within which to complete construction of said project for such reasonable period as might be required and to which plaintiff was entitled, all of which said requests were denied.

IV.

Plaintiff was unavoidably delayed in the performance of said work for a period of at least 340 days by the following causes:

1. The work was delayed by stormy and inclement weather.

2. The work was delayed by a general strike in the San Francisco Bay area.

3. The work was delayed by the character of the ground encountered which was totally different from that represented by the contract and geological report.

4. The work was delayed because it was physically impossible to construct said tunnels in the ground encountered in the manner contemplated by the contract and a much slower and more expensive method of construction was necessary.

5. The work was delayed by the matters and things particularly set forth and alleged in paragraphs I to V, inclusive, of plaintiff's second defense hereinabove in this answer set forth and plaintiff refers to and incorporates said paragraphs of said second defense as a part [68] of this defense.

6. The work was delayed because of the inadequate and unsafe design of the tunnel.

7. The work was delayed by additional work required to be done which was not included in, or contemplated by, the contract, plans and specifications.

8. The work was delayed by slides and by the tunnels caving in, the necessity of reexcavating

and retimbering the caved in portions, the necessity of resetting timbers and moving them back where pressure of the ground had forced them out of alignment and by changes in the design for lining a part of the tunnels.

9. The work was delayed by conditions which arose, due to the nature of the ground, which endangered the lives of workmen.

10. The work was delayed by orders of the Industrial Accident Commission of California stopping and suspending all work.

11. The work was delayed through failure of defendant and the District Engineer of defendant to perform their obligations under the contract and in particular in failing to furnish to plaintiff lines and grades to which to work.

12. The work was delayed by orders of said Engineer stopping and suspending work.

13. The work was delayed by other causes not the fault of plaintiff and over which it had no control.

None of said causes of delay were due to any fault of plaintiff and over none of them did it have any control.

Said Engineer and defendant knew the condition of the [69] ground which had been encountered and knew of the existence of the causes for the delays.

V.

When plaintiff filed with defendant said requests for said extensions of time, neither said District

Engineer of defendant nor defendant granted, or have ever granted, to plaintiff a hearing thereon, or given to plaintiff any opportunity properly or at all to present same, but have arbitrarily, capriciously and fraudulently, knowing that plaintiff was entitled to extensions of time, denied the same.

Plaintiff is informed and believes and therefore alleges that said Engineer has failed to consider whether plaintiff was entitled to an extension of time and has failed to exercise his judgment as to whether the work was unavoidably delayed and has failed to perform his duties and obligations under said contract and that if he did act in any way on said requests for said extensions of time, such action was arbitrary, capricious and fraudulent and not based on the facts or his knowledge of the conditions which caused the delays.

Plaintiff is further informed and believes and therefore alleges that said District Engineer did not act on said requests of plaintiff for said extensions of time at all, but that they were denied by defendant without reference to the opinion or judgment of said Engineer.

VI.

Said District Engineer on or about the 1st day of June, 1936, measured the work which plaintiff had done under its said contract during the month of May, 1936, and on the 10th day of June, 1936, delivered an estimate to this plaintiff stating the amount of work performed by plaintiff during the month of May, 1936, and which said estimate stated

that plaintiff was entitled to be paid by defendant for said work the amount of $152,086.98. [70]

The estimates theretofore made by defendant stated that the total value of the work at said time done and performed by plaintiff in and about the performance of said project since the commencement of the performance of the contract by plaintiff exceeded the sum of $2,000,000.00.

Defendant also, at the time of the delivery by it to plaintiff of said above referred to estimate, delivered to this plaintiff its check, for the work done by said plaintiff during the month of May, 1936, in the sum of $148,586.98, and no more, and defendant has not paid or offered to pay to plaintiff any other or further amount or sum than that specified in said check for or on account of said progress payment so due and payable on the 10th day of June, 1936.

Defendant withheld from plaintiff a penalty of $500.00 per day for all days after May 24th, 1936, including non-working days, in making tender to plaintiff of the money due it under the contract for work done by plaintiff during said month of May, the total of such penalty withheld being $3,500.00, including $500.00 for a legal holiday and Sunday, a non-working day; and plaintiff is informed and believes and therefore alleges the fact to be that defendant intended to and would have withheld similarly $500.00 per day from any and all payments which might thereafter become due to plaintiff until the completion of the performance by plaintiff of the work of construction of said project; and that

the total amount which would have been so withheld by defendant from progress payments due and to become due to plaintiff would have been the sum of not less than $120,000.00.

By reason of the matters and things hereinbefore in this paragraph referred to and by reason of its failure to make and pay to plaintiff the full amount of said progress payment in the sum of $152,086.98 then due and payable, defendant breached its said contract with plaintiff in a substantial and material respect. [71]

For said reasons the consideration for plaintiff's obligation under said contract then and there failed in part, in the failure and refusal of said defendant, as aforesaid, to pay and in not paying to this plaintiff the amount and sum of money estimated by said defendant to be due and payable to this plaintiff for work done by it under said contract for and during the month of May, 1936, and according to the estimate of said District Engineer, as provided in said contract.

Further, the consideration for said contract then and there failed in a material respect in the failure and refusal of said defendant to pay to plaintiff the amount and sum of money estimated by said defendant to be due and payable to this plaintiff for work and labor done and performed by it under said contract for the month of May, 1936, under the terms of said estimate of said District Engineer, and in failing and refusing to grant to this plaintiff any extension of time whatsoever, as hereinbefore stated,

and in deducting the sum of $3,500.00 as a penalty under said contract for failure to complete the same within said contract period.

VII.

For the reason, among others, that defendant failed and refused to grant to plaintiff the extension of time to which it was entitled and failed and refused to pay to plaintiff the progress payments due and owing to it under said contract, plaintiff on June 13th, 1936, rescinded said contract and delivered to defendant the notice of rescission, a copy of which is set forth in paragraph III of defendant's second, separate and further defense to the first count of the complaint herein.

Upon said delivery of said notice of rescission plaintiff ceased all work on said project and has not since performed any work thereon and said contract was thereupon rescinded. [72]

For an eighth and further and separate defense to said cross-complaint, plaintiff alleges:

I.

Plaintiff here repeats and incorporates herein as a part of this defense the allegations of paragraphs I to V, inclusive, of its second defense hereinabove in this answer set forth.

II.

Plaintiff was ignorant of ground conditions encountered in the construction of the tunnels at the time it entered into said contract with defendant

and plaintiff could not have determined or ascertained the true condition of the ground to be encountered prior to the submission of its said bid to defendant or prior to the execution of said contract, but was forced to and did in fact rely upon the representations obtained from the specifications and geological report therein referred to and plaintiff was misled thereby and was therefore mistaken as to the true condition of the ground; but defendant, so plaintiff is informed and believes and therefore alleges, had knowledge of facts and circumstances from which it knew or should or could have known or suspected at said time that the ground through which the tunnels would be driven was not in fact self-supporting either for ninety per cent of the length of the said tunnels, or any part thereof, but was in truth and in fact not self-supporting for the entire length of said tunnels. That defendant falsely and fraudulently failed and neglected to inform and acquaint plaintiff with such facts and circumstances. For said reasons plaintiff entered into said contract with defendant solely by reason of the mistaken belief of plaintiff as to the said ground conditions and by reason of the inability of plaintiff to ascertain the true ground conditions and by reason of the fraud of defendant as hereinbefore stated and for said reasons plaintiff was relieved of any obligation further to perform said contract and was entitled to rescind and did rescind same in accord-
[73] ance with its notification to defendant to that effect on June 13th, 1936, a copy of which is set

forth in paragraph III of defendant's second, separate and further defense to the first count of the complaint herein.

Wherefore, plaintiff and cross-defendant prays that defendant and cross-complainant take nothing by its cross-complaint and that plaintiff have judgment in accordance with the prayer of its complaint on file herein.

THELEN & MARRIN,
EUGENE E. TREFETHEN,
DeLANCEY C. SMITH,
J. PAUL ST. SURE,
Attorneys for plaintiff and cross-defendant.

Receipt of a copy of the within Answer to Cross-Complaint this ..... day of February, 1937, is hereby admitted.

ARCHIBALD B. TINNING,
T. P. WITTSCHEN,
Attorneys for defendant and cross-complainant. [74]

State of California,
County of Alameda—ss.

Henry J. Kaiser, being first duly sworn, deposes and says:

That the plaintiff and cross-defendant named in the foregoing Answer to Cross-Complaint is a corporation; that affiant is an officer, to-wit, the presi-

dent of said corporation and as such is authorized to and does make this verification for and on behalf of said corporation; that affiant has read said Answer to Cross-Complaint and knows the contents thereof and that the same is true of his own knowledge, except as to matters which are therein stated on information and belief and as to those matters he believes it to be true.

HENRY J. KAISER.

Subscribed and sworn to before me this 10th day of February, 1937.

[Notarial Seal] PAUL E. ROGERS,
Notary Public
in and for the County of Alameda,
State of California.

[Endorsed]: Filed Feb. 10, 1937. [75]

[Title of District Court and Cause.]

ANSWER TO CROSS-COMPLAINT

[76]

Come now cross-defendants, Hartford Accident and Indemnity Company, Fidelity and Deposit Company of Maryland, The Aetna Casualty and Surety Company, Indemnity Insurance Company of North America, American Surety Company of New York, Fireman's Fund Indemnity Company, Maryland Casualty Company, United States Fidelity and Guaranty Company, The Fidelity and Casualty Company of New York, Glens Falls Indemnity

Company, Standard Surety and Casualty Company of New York, Standard Accident Insurance Company, Pacific Indemnity Company, Massachusetts Bonding and Insurance Company, Continental Casualty Company, and New Amsterdam Casualty Company, corporations, and answering the cross-complaint of defendant and cross-complainant, Joint Highway District No. 13 of the State of California, a public corporation, on file herein, said cross-defendants admit, deny and allege as follows:

I.

Answering paragraph IV of said cross-complaint, said cross-defendants deny generally and specifically, all and singular the allegations in said paragraph contained except that said cross-defendants admit that a contract in writing was entered into between plaintiff and defendant herein on the 4th day of June, 1934.

II.

Answering paragraph VI of said cross-complaint, said cross-defendants deny generally and specifically, each and all the allegations thereof beginning with the words "upon which date", line 28, page 31, to and including the words "or any part thereof", line 31, page 31; and in this behalf cross-defendants are informed and believe and therefore allege that on June 13, 1936, plaintiff duly rescinded said contract of June 4, 1934, for good and sufficient reasons and in accordance with law, and that since said date plaintiff has done no work under said contract. [77]

III.

Answering paragraph VII of said cross-complaint, said cross-defendants deny generally and specifically, each and all the allegations in said paragraph contained, except that said cross-defendants admit that they and each of them received from cross-complainant a copy of a notice in the form stated in said paragraph.

IV.

Answering paragraph VIII of said cross-complaint, said cross-defendants admit that they have not and none of them has done any work under said contract and that plaintiff has done no work under said contract since rescinding said contract on June 13, 1936. and deny generally and specifically each and every other allegation in said paragraph contained.

V.

Answering paragraph IX of said cross-complaint, said cross-defendants allege that they have no information or belief upon the subject sufficient to enable them, or any of them, to answer the allegations of said paragraph, and therefore and placing their denial upon that ground deny each and every allegation in said paragraph contained, except that said cross-defendants deny that plaintiff abandoned said contract at any time.

VI.

Answering paragraph X of said cross-complaint, said cross-defendants allege that they have no in-

formation or belief upon the subject sufficient to enable them, or any of them, to answer the allegations of said paragraph, and therefore and placing their denial upon that ground deny each and every allegation in said paragraph contained. [78]

VII.

Answering paragraph XI of said cross-complaint, said cross-defendants allege that they have no information or belief upon the subject sufficient to enable them, or any of them, to answer the allegations of said paragraph, and therefore and placing their denial upon that ground deny each and every allegation in said paragraph contained.

VIII.

Answering paragraph XII of said cross-complaint, said cross-defendants allege that said contract between plaintiff and cross-defendant and defendant and cross-complainant provides as follows:

"Section 4. Time

"(a) Commencement of Work.—The Contractor shall commence work within ten (10) days after the execution of the contract for the work by the Board of Directors and shall continue without interruption unless otherwise directed by the District. At least three (3) days before starting, the Contractor shall notify the District Engineer in writing of the date that work is to commence.

"(b) Completion of Work.—The time of completion of the entire work specified herein shall

be within a period of seven hundred and twenty (720) calendar days from the date of the execution of the contract by the Board of Directors.

"(c) Extension of Time.—The time during which the Contractor is delayed in said work by Acts of God, or by stormy or inclement weather, or by any reason which, in the judgment of the District Engineer, unavoidably delays the work, shall be added to the aforesaid time for completion, provided that the Board of Directors approve in advance the written application therefor, which must be made by the Contractor for such an extension, before the expiration of the time limit fixed herein, or a duly granted extension thereof.

"(d) Damages for Delay. — The parties hereto expressly stipulate and agree that time is the essence of this contract. In case the work is not completed within the time specified in the contract or within such extensions of the contract time as may be allowed as herein provided, it is distinctly understood and agreed that the Contractor shall pay the District [79] as agreed and liquidated damages and not as a penalty five hundred dollars ($500.00) for each and every working day which may elapse between the limiting date as herein provided and the date of actual completion of the work, said sum being specifically agreed upon as a measure of damage to the District by reason of delay in the completion of the work; it being expressly

stipulated and agreed that it would be impracticable to estimate and ascertain the actual damages sustained by the District under such circumstances; and the Contractor agrees and consents that the amount of such liquidated damages so fixed shall be deducted and retained by the District from any money then due, or thereafter to become due, the Contractor."

and cross-defendants deny each and every allegation in said paragraph inconsistent with the above quoted provisions of said contract.

IX.

Answering paragraph XIII of said cross-complaint, said cross-defendants allege that they have no information or belief upon the subject sufficient to enable them, or any of them, to answer the allegations of said paragraph, and therefore and placing their denial upon that ground deny each and every allegation in said paragraph contained, except that said cross-defendants deny that plaintiff abandoned said contract and/or that there was any delay in the construction of said project caused by the alleged or any default of plaintiff.

X.

Said cross-defendants deny generally and specifically, all and singular, each and every allegation contained in paragraph XIV of said cross-complaint; and deny that defendant and cross-complainant has suffered and/or sustained damages or any

damage in the aggregate amount of $341,557.84, or in any sum or amount or at all.

XI.

Further answering said cross-complaint, said cross- [80] defendants allege that the contract between plaintiff and defendant provided that upon discontinuance of the contract by plaintiff before completion defendant and cross-complainant should, in the manner provided in said contract, proceed with the completion thereof and that in case the expense of completion

> "is less than the sum which would have been payable under this contract, if the same had been completed by the said second party (plaintiff), the said second party shall be entitled to receive the difference, and in case such expense shall exceed the last said amount, then the said second party or its bondsmen shall pay the amount of such excess to the first party on notice from the said first party (defendant and cross-complainant) of the excess so due"

and cross-defendants allege that at the time of the filing of said cross-complaint the expense of completion of said contract as in said contract provided had not been determined; that at the time of the filing of said cross-complaint, cross-defendant did not have a cause of action against cross-defendants upon the alleged bond for the damages alleged, or any thereof, and that said cross-complaint at the time of filing was and is premature.

XII.

Further answering said cross-complaint and as a separate defense thereto, said cross-defendants allege that the contract between plaintiff and defendant and cross-complainant provided in paragraph 5 thereof that after abandonment or discontinuance in the performance thereof by plaintiff or after notice by defendant and cross-complainant to plaintiff to discontinue, defendant and cross-complainant

> "shall thereupon have the power to place such and so many persons, and to obtain by contract, purchase or hire, such animals, carts, wagons, implements, tools, material or materials, by contract or otherwise, as said first party may deem advisable, to work at and be used to complete the work herein described, or such part thereof as the agent authorized to superintend the same may deem [81] necessary, and to use such material as they may find upon the line of said work and to charge the expense of such labor and material, animals, carts, wagons, implements and tools to the second party, and the expense so charged shall be deducted and paid by the first party out of such moneys as may be either due or may at any time thereafter become due to the said second party under and by virtue of this contract or any part thereof."

that defendant and cross-complainant did not proceed with the completion of said contract after the alleged abandonment of the work thereunder by plaintiff in the manner provided in said contract,

but proceeded with the completion thereof in a manner contrary to and in violation of the terms, conditions and provisions of said contract; and that by reason of said breach of said contract by defendant and cross-complainant, said answering cross-defendants are and each of them is relieved of any and all liability to defendant and cross-complainant under the alleged bond for and on account of the items of damage and each and all thereof alleged in said cross-complaint.

XIII.

Further answering said cross-complaint, and as a separate defense thereto, said answering cross-defendants are informed and believe and therefore allege:

1. That heretofore and on or about the 4th day of May, 1934, defendant advertised for bids to be made to it for the construction of the project described in the answer and cross-complaint, and invited bidders to submit bids therefor based upon the notice to bidders, plans, specifications and geological report furnished to bidders or made available to bidders in connection with any bid made; and that pursuant to said notice to bidders and based upon the representations to bidders contained in the plans and specifications and geological report, plaintiff submitted a bid for the doing of the work described [82] in the notice to bidders aforesaid.

Thereafter the bid of plaintiff was duly accepted and a contract in writing entered into between plain-

tiff and defendant pursuant to the bid made by plaintiff, to which contract reference is hereby made for a full statement of the details thereof, and to the documents referred to therein for a full statement of the details of same, with the same force and effect as if same were set forth in this answer, it being impracticable to fully set forth true copies of said contract and all documents referred to in the notice to bidders, plans and specifications as a part of this answer, and same being readily available in the records of defendant, which is a public corporation.

Plaintiff was induced to bid, and did bid solely upon the representations contained in the plans, specifications and geological report to which the attention of bidders was invited; and plaintiff relied upon all the representations therein contained in making its bid and in entering into a contract with the defendant pursuant to such bid, and would not have made said bid or entered into such contract, except for the representations contained in the plans, specifications and geological report.

2. That in and by the plans and specifications and the geological report it was represented by defendant to plaintiff that the tunnels described therein would be driven through ground which was self-supporting in character for ninety per cent or more of the total length of said tunnels, and which could be constructed and would be required to be constructed with the use only of temporary timber supports for the excavation of said tunnels which would be removed before the installation therein of the

concrete lining or permanent structure thereof provided to be built therein under the plans and specifications. [83]

That in truth and in fact said representations were false in that the entire length of the tunnels to be constructed was in ground which was not self-supporting, and which required permanent timbering or other support until and after the installation therein of the permanent concrete lining or structure thereof, and required all of the support placed therein prior to permanent lining to remain without removal from said tunnels.

3. After entering into said contract with defendant, as aforesaid, plaintiff commenced work thereunder, and undertook the construction of said tunnels under and in accordance with the plans and specifications and in the belief that the representations contained in the plans and specifications and the geological report were true and correct. As the construction of said tunnels progressed, plaintiff found that the ground through which same were being driven was not self-supporting, and that all temporary support for the excavation for same was required of necessity to remain permanently.

4. By reason of the character of ground encountered in the excavation and construction of said tunnels as aforesaid, plaintiff was necessarily required to and did expend large sums of money for labor to excavate and construct said tunnels in excess of that which would have been spent by plaintiff in the event the construction of same could have been per-

formed in accordance with the representations made as aforesaid, and also was compelled to and did expend large sums for materials and for the proper prosecution of the work in excess of what would otherwise have been necessary.

5. It was never within the contemplation of said contract or of the parties to it that said tunnels should be constructed in said manner or through ground of the character and type [84] actually encountered and plaintiff was not, therefore, obligated or required by said contract to so construct said tunnels and is entitled to recover from defendant the reasonable value of the work done by it in constructing said tunnels and a reasonable profit.

6. That for the reason, among others, that the condition of said ground had been misrepresented by defendant to plaintiff, as hereinbefore stated, and that the work of constructing said tunnels was so radically different from that required by the contract, plaintiff, on June 13th, 1936, rescinded said contract and delivered to defendant the notice of rescission, a copy of which is set forth in paragraph III of defendant's second, separate and further defense to the first count of the complaint herein.

Upon said delivery of said notice of rescission plaintiff ceased all work on said project and has not since performed any work thereon and said contract thereupon was rescinded.

XIV.

Further answering said cross-complaint and as a separate defense thereto, said answering cross-

defendants are informed and believe and therefore allege:

1. Plaintiff here repeats and incorporates as a part of this defense the allegations of paragraphs I to VI, inclusive, of its second defense hereinabove in this answer set forth.

2. The ground condition aforesaid was understood by both plaintiff and defendant and contemplated by both of them to be in accordance with the plans and specifications and the representations contained therein and in the geological report referred to therein; and said contract was entered into in the contemplation by both parties that self-supporting ground would be encountered [85] in the excavation and construction of the tunnels for ninety per cent, or more, of the length thereof, all as hereinbefore alleged; and each party to said contract was mistaken as to the true facts; and by reason of such mistake plaintiff was relieved of any obligation further to perform said contract, and was entitled to rescind and did rescind same in accordance with its notification to defendant to that effect on June 13th, 1936.

XV.

Further answering said cross-complaint and as a separate defense thereto, said answering cross-defendants are informed and believe and therefore allege:

1. Plaintiff here repeats and incorporates as a part of this defense the allegations of paragraphs I to VI, inclusive, of its second defense hereinabove in this answer set forth.

2. That plaintiff was ignorant of, and mistaken as to, the ground condition to be encountered in the construction of the tunnels as aforesaid at the time it entered into said contract with defendant; but defendant, so plaintiff is informed and believes and therefore alleges, had knowledge of facts and circumstances from which it knew or should or could have known or suspected at said time that the ground through which the tunnels would be driven was not in fact self-supporting either for ninety per cent of the length of the said tunnels, or any part thereof, but was in truth and in fact not self-supporting for the entire length of said tunnels. That defendant falsely and fraudulently failed and neglected to inform and acquaint plaintiff with such facts and circumstances. For said reasons plaintiff entered into said contract with defendant solely by reason of the fraud of defendant as hereinbefore stated, and by reason of such fraud plaintiff was relieved of any obligation further to perform said [86] contract and was entitled to rescind same in accordance with its notification to defendant to that effect on June 13th, 1936.

XVI.

Further answering said cross-complaint and as a separate defense thereto, said answering cross-defendants are informed and believe and therefore allege:

1. Plaintiff here repeats and incorporates as a part of this defense the allegations of paragraphs I to VI, inclusive, of its second defense hereinabove in this answer set forth.

2. By reason of the difference in ground conditions encountered in the construction of said tunnels as aforesaid, and of the radically different character of the work required to be done by plaintiff under the contract as a result of such different ground condition, the doing, performance or construction of the work contracted for under the contract, plans and specifications became and was in fact impossible in that the facts and premises upon which said contract was based were of a character that the assumed work to be done and conditions to be found turned out not to exist, and thereby plaintiff was called upon to and did work of such different character to that contemplated that in truth and in fact no contract ever existed for the work done by plaintiff.

XVII.

Further answering said cross-complaint and as a separate defense thereto, said answering cross-defendants are informed and believe and therefore allege:

1. In said contract dated June 4th, 1934, between plaintiff and defendant, referred to in plaintiff's second defense, it is provided that the District Engineer of defendant would give plaintiff sufficient points and lines to enable plaintiff to construct said project in accordance with said contract and said [87] plans and specifications and that defendant would set sufficient points to line and grade for plaintiff to work to.

2. Shortly after the commencement of construction operations under said contract, and repeatedly

thereafter, plaintiff demanded of the then duly appointed and acting District Engineer of defendant and of defendant that said Engineer set the necessary points and determine the necessary lines to enable plaintiff to construct said project as required by said contract. That notwithstanding said demands of plaintiff said Engineer failed and refused, and has at all times failed and refused, to set said points, or establish said lines, or any of them, and the refusal of said Engineer so to do was ratified and approved by defendant.

3. Said refusal of said Engineer and defendant to establish said lines and set said points is, and was, a breach of said contract and for that reason, among others, plaintiff, on June 13th, 1936, delivered to defendant the notice of rescission of said contract referred to in plaintiff's second defense and rescinded said contract.

XVIII.

Further answering said cross-complaint and as a separate defense thereto, said answering cross-defendants are informed and believe and therefore allege:

1. Said contract, dated June 4th, 1934, between plaintiff and defendant, referred to in plaintiff's second defense herein provides, in part, as follows:

> "(b) Completion of Work.—The time of completion of the entire work specified herein shall be within a period of seven hundred and twenty (720) calendar days from the date of the

execution of the contract by the Board of Directors.

"(c) Extension of Time.—The time during which the Contractor is delayed in said work by Acts of God, or by stormy or inclement weather, or by any [88] reason which, in the judgment of the District Engineer, unavoidably delays the work, shall be added to the aforesaid time for completion, provided that the Board of Directors approve in advance the written application therefor, which must be made by the Contractor for such an extension, before the expiration of the time limit fixed herein, or a duly granted extension thereof."

Said contract further purports to provide that plaintiff will pay to defendant as liquidated damages the amount of $500.00 per day for each and every working day that elapses between the limiting date provided in the contract and the date of actual completion of the work.

Said contract further provides, in part, as follows:

"7. Payments for said work will be made only upon the certificate of the District Engineer for work actually performed. The District Engineer shall measure the work on or about the first day of each month and at the time of completion of the entire work, and shall render a certificate on or about the tenth day of each month and at the completion of the entire work, stating the amount of work performed during

the previous calendar month, and during the current month, at the time of completion. The Contractor shall then, at the times above specified, be entitled to receive a payment from the District in an amount to be determined as follows: Until the total value of the work done since commencement of performance of the contract exceeds Four Hundred Thousand Dollars ($400,000.00) the payment will be seventy-five per cent (75%) of the amount specified in the District Engineer's certificate; thereafter and until the total value of the work done since the commencement of performance of the contract equals One Million Dollars ($1,000,000.00), the constant sum of One Hundred Thousand Dollars ($100,000.00), will be retained by the District out of said total value thereafter the progress payment will be ninety per cent (90%) of the amount specified in the Engineer's certificate, provided that no such estimate of payment shall be required to be made when, in the judgment of the District Engineer, the work is not proceeding in accordance with the provisions of the contract, or when, in his judgment, the total value of the work done since the last estimate amounts to less than Five Hundred Dollars ($500.00), except the certificate and payment required at the completion of the entire work."

2. Said contract was executed by the Board of Directors of defendant on June 4th, 1934. [89]

3. On June 10th, 1935, plaintiff applied to defendant in writing for an extension of time within which to complete the work.

By letter dated July 12th, 1935, addressed to plaintiff, defendant denied said request for an extension of time.

By letter dated July 26th, 1935, from plaintiff to defendant, plaintiff protested said denial and reaffirmed its request for such extension.

By letter to defendant dated August 28th, 1935, plaintiff again demanded an extension of time sufficient to enable it to complete the work.

By letter to defendant dated May 8th, 1936, plaintiff again made written application for an extension of time.

By letter from defendant to plaintiff dated May 14th, 1936, defendant denied said request for an extension of time.

In addition, plaintiff on many other occasions prior to May 24th, 1936, requested the District Engineer of defendant and requested defendant to grant to plaintiff an extension of time within which to complete construction of said project for such reasonable period as might be required and to which plaintiff was entitled, all of which said requests were denied.

4. Plaintiff was unavoidably delayed in the performance of said work for a period of at least 340 days by the following causes:

(1) The work was delayed by stormy and inclement weather.

(2) The work was delayed by a general strike in the San Francisco Bay area.

(3) The work was delayed by the character of the ground encountered which was totally different from that represented by the contract and geological report. [90]

(4) The work was delayed because it was physically impossible to construct said tunnels in the ground encountered in the manner contemplated by the contract and a much slower and more expensive method of construction was necessary.

(5) The work was delayed by the matters and things particularly set forth and alleged in paragraphs I to V, inclusive, of plaintiff's second defense hereinabove in this answer set forth and plaintiff refers to and incorporates said paragraphs of said second defense as a part of this defense.

(6) The work was delayed because of the inadequate and unsafe design of the tunnel.

(7) The work was delayed by additional work required to be done which was not included in, or contemplated by, the contract, plans and specifications.

(8) The work was delayed by slides and by the tunnels caving in, the necessity of reexcavating and retimbering the caved in portions, the necessity of resetting timbers and moving them back where pressure of the ground had forced them out of alignment and by changes in the design for lining a part of the tunnels.

(9) The work was delayed by conditions which arose, due to the nature of the ground, which endangered the lives of workmen.

(10) The work was delayed by orders of the Industrial Accident Commission of California stopping and suspending all work.

(11) The work was delayed through failure of defendant and the District Engineer of defendant to [91] perform their obligations under the contract and in particular in failing to furnish to plaintiff lines and grades to which to work.

(12) The work was delayed by orders of said Engineer stopping and suspending work.

(13) The work was delayed by other causes not the fault of plaintiff and over which it had no control.

None of said causes of delay were due to any fault of plaintiff and over none of them did it have any control.

Said Engineer and defendant knew the condition of the ground which had been encountered and know of the existence of the causes for the delays.

5. When plaintiff filed with defendant said requests for said extensions of time, neither said District Engineer of defendant nor defendant granted, or have ever granted, to plaintiff a hearing thereon, or given to plaintiff any opportunity properly or at all to present same, but have arbitrarily, capriciously and fraudulently, knowing that plaintiff was entitled to extensions of time, denied the same.

Plaintiff is informed and believes and therefore alleges that said Engineer has failed to consider

whether plaintiff was entitled to an extension of time and has failed to exercise his judgment as to whether the work was unavoidably delayed and has failed to perform his duties a d obligations under said contract and that if he did act in any way on said requests for said extensions of time, such action was arbitrary, capricious and fraudulent and not based on the facts or his knowledge of the conditions which caused the delays.

Plaintiff is further informed and believes and therefore alleges that said District Engineer did not act on said requests [92] of plaintiff for said extensions of time at all, but that they were denied by defendant without reference to the opinion or judgment of said Engineer.

6. Said District Engineer on or about the 1st day of June, 1936 measured the work which plaintiff had done under its said contract during the month of May, 1936, and on the 10th day of June, 1936 delivered an estimate to this plaintiff stating the amount of work performed by plaintiff during the month of May, 1936, and which said estimate stated that plaintiff was entitled to be paid by defendant for said work the amount of $152,086.98.

The estimates theretofore made by defendant stated that the total value of the work at said time done and performed by plaintiff in and about the performance of said project since the commencement of the performance of the contract by plaintiff exceeded the sum of $2,000,000.00.

Defendant also, at the time of the delivery by it to plaintiff of said above referred to estimate, de-

livered to this plaintiff its check, for the work done by said plaintiff during the month of May, 1936, in the sum of $148,586.98, and no more, and defendant has not paid or offered to pay to plaintiff any other or further amount or sum than that specified in said check for or on account of said progress payment so due and payable on the 10th day of June, 1936.

Defendant withheld from plaintiff a penalty of $500.00 per day for all days after May 24th, 1936, including non-working days, in making tender to plaintiff of the money due it under the contract for work done by plaintiff during said month of May, the total of such penalty withheld being $3,500.00, including $500.00 for a legal holiday and Sunday, a non-working day; and plaintiff is informed and believes and therefore alleges the fact to be that [93] defendant intended to and would have withheld similarly $500.00 per day from any and all payments which might thereafter become due to plaintiff until the completion of the performance by plaintiff of the work of construction of said project; and that the total amount which would have been so withheld by defendant from progress payments due and to become due to plaintiff would have been the sum of not less than $120,000.00.

By reason of the matters and things hereinbefore in this paragraph referred to and by reason of its failure to make and pay to plaintiff the full amount of said progress payment in the sum of $152,086.98 then due and payable, defendant breached its said

contract with plaintiff in a substantial and material respect.

For said reasons the consideration for plaintiff's obligation under said contract then and there failed in part, in the failure and refusal of said defendant, as aforesaid, to pay and in not paying to this plaintiff the amount and sum of money estimated by said defendant to be due and payable to this plaintiff for work done by it under said contract for and during the month of May, 1936, and according to the estimate of said District Engineer, as provided in said contract.

Further, the consideration for said contract then and there failed in a material respect in the failure and refusal of said defendant to pay to plaintiff the amount and sum of money estimated by said defendant to be due and payable to this plaintiff for work and labor done and performed by it under said contract for the month of May, 1936, under the terms of said estimate of said District Engineer, and in failing and refusing to grant to this plaintiff any extension of time whatsoever, as hereinbefore stated, and in deducting the sum of $3,500.00 as a penalty under [94] said contract for failure to complete the same within said contract period.

7. For the reason, among others, that defendant failed and refused to grant to plaintiff the extension of time to which it was entitled and failed and refused to pay to plaintiff the progress payments due and owing to it under said contract, plaintiff

on June 13th, 1936, rescinded said contract and delivered to defendant the notice of rescission, a copy of which is set forth in paragraph III of defendant's second, separate and further defense to the first count of the complaint herein.

Upon said delivery of said notice of rescission plaintiff ceased all work on said project and has not since performed any work thereon and said contract was thereupon rescinded.

XIX.

Further answering said cross-complaint and as a separate defense thereto, said answering cross-defendants are informed and believe and therefore allege:

1. Plaintiff here repeats and incorporates herein as a part of this defense the allegations of paragraphs I to V, inclusive, of its second defense hereinabove in this answer set forth.

2. Plaintiff was ignorant of ground conditions encountered in the construction of the tunnels at the time it entered into said contract with defendant and plaintiff could not have determined or ascertained the true condition of the ground to be encountered prior to the submission of its said bid to defendant or prior to the execution of said contract, but was forced to and did in fact rely upon the representations obtained from the specifications and geological report therein referred to and plaintiff was misled thereby and was therefore mistaken as to the true condition of the ground; but defendant, so plaintiff is informed and believes and there-

fore alleges, had knowledge of facts and cir- [95] cumstances from which it knew or should or could have known or suspected at said time that the ground through which the tunnels would be driven was not in fact self-supporting either for ninety per cent of the length of the said tunnels, or any part thereof, but was in truth and in fact not self-supporting for the entire length of said tunnels. That defendant falsely and fraudulently failed and neglected to inform and acquaint plaintiff with such facts and circumstances. For said reasons plaintiff entered into said contract with defendant solely by reason of the mistaken belief of plaintiff as to the said ground conditions and by reason of the fraud of defendant as hereinbefore stated and for said reasons plaintiff was relieved of any obligation further to perform said contract and was entitled to rescind and did rescind same in accordance with its notification to defendant to that effect on June 13th, 1936, a copy of which is set forth in paragraph III of defendant's second, separate and further defense to the first count of the complaint herein.

Wherefore, said cross-defendants pray that defendant and cross-complainant take nothing by its cross-complaint and that said cross-defendants be hence dismissed with their costs.

AMENDMENT TO COMPLAINT.

Comes now plaintiff and by leave of Court first had and obtained files this amendment to the complaint on file herein.

Said complaint is amended by adding to the first cause of action set forth therein the following paragraph, to be numbered paragraph VI, to-wit:

VI.

At all times during the performance by plaintiff of such work and labor and the furnishing of said

materials to said defendant at its special instance and request plaintiff was a [100] duly licensed contractor under the laws of the State of California.

Said complaint is further amended by adding to the second cause of action set forth therein the following paragraph, to be numbered paragraph III, to-wit:

III.

Said work was done, labor performed and materials furnished to defendant at its special instance and request and at all times during the performance of all of said acts plaintiff was a duly licensed contractor under the laws of the State of California.

AMENDMENT TO ANSWER OF PLAINTIFF TO CROSS-COMPLAINT.

Comes now plaintiff and cross-defendant Six Companies of California and by leave of Court first had and obtained files this amendment to its answer to the cross-complaint.

Paragraph II on page 2 of said answer is amended to read as follows:

II.

Answering the allegations contained in paragraph IV of the cross-complaint admits that a contract in writing was entered into between plaintiff and defendant which was dated June 4th, [104] 1934, but in that connection plaintiff is informed and believes and therefore alleges that said contract was not executed by the Board of Directors of defendant on June 4th, 1934, but was executed by said Board of Directors on June 14th, 1934. Plaintiff denies each and all of the remaining allegations in said paragraph contained, commencing with the word "wherein" on line 30 of page 30 of the cross-complaint, to and including the end of said paragraph on line 10 on page 31 of the cross-complaint.

Paragraph II of plaintiff's seventh defense to the cross-complaint, on page 14, is amended to read as follows:

II.

Said contract is dated June 4th, 1934, but plaintiff is informed and believes and therefore alleges

that said contract was executed by the Board of Directors of defendant on June 14th, 1934, and was not executed by said Board of Directors prior thereto.

Dated: March 4th, 1938.

AMENDMENT TO ANSWER OF CROSS-DEFENDANTS SURETY COMPANIES TO CROSS-COMPLAINT. [108]

Come now cross-defendants, Hartford Accident and Indemnity Company, Fidelity and Deposit Company of Maryland, The Aetna Casualty and Surety Company, Indemnity Insurance Company of North America, American Surety Company of New York, Fireman's Fund Indemnity Company, Maryland Casualty Company, United States Fi-

delity and Guaranty Company, The Fidelity and Casualty Company of New York, Glens Falls Indemnity Company, Standard Surety and Casualty Company of New York, Standard Accident Insurance Company, Pacific Indemnity Company, Massachusetts Bonding and Insurance Company, Continental Casualty Company, and New Amsterdam Casualty Company, corporations, and, by leave of Court first had and obtained, file this amendment to their answer to the cross-complaint herein.

Paragraph I on page 2 of said answer is amended to read as follows:

"I.

Answering paragraph IV of said cross-complaint, said cross-defendants deny generally and specifically, all and singular, the allegations in said paragraph contained except that said cross-defendants admit that a contract in writing was entered into between plaintiff and defendant herein which was dated June 4, 1934, but in that connection said cross-defendants are informed and believe and therefore allege that said contract was not executed by the Board of Directors of defendant on June 4, 1934 but was executed by said Board of Directors on June 14, 1934."

Paragraph XVIII, Sub-division 2, page 14 of said cross-defendants' answer to the cross complaint is amended to read as follows: [109]

"2. Said contract is dated June 4, 1934 but cross-defendants are informed and believe and

therefore allege that said contract was executed by the Board of Directors of defendant and cross-complainant on June 14, 1934 and was not executed by said Board of Directors prior to said last mentioned date."

At a Stated Term of the Southern Division of the United States District Court for the Northern District of California, held at the Court Room thereof, in the City and County of San Francisco, on Friday, the 27th day of May, in the year of our Lord one thousand nine hundred and thirty-eight.

Present: the Honorable Michael J. Roche,
District Judge.

[Title of District Court and Cause.]

The parties hereto being present as heretofore the further trial hereof was thereupon resumed. George T. Sloan was sworn and testified on behalf of the plaintiff and the plaintiff rested. Mr. Wittschen made a motion to strike out certain evidence on the grounds stated, and after hearing the attorneys, it is Ordered that said motion stand submitted. Charles Derleth, Jr., and Wallace B. Boggs were sworn and testified on behalf of the defendant and thereupon the defendant rested its case on the right of the plaintiff to rescind the contract involved herein. Mr. Wittschen made and filed a mo-

tion for Special Findings and for Judgment in favor of the defendant on the right of plaintiff to rescind the contract involved herein. Mr. Marrin made a motion for judgment in favor of the plaintiff on the grounds stated and made a motion for Special Findings of Fact and Conclusions of Law in favor of the plaintiff on the grounds stated. After hearing the attorneys, it is Ordered that the further trial of this cause be and the same is hereby continued to Tuesday, May 31st, 1938 at ten o'clock a. m. [112]

At a Stated Term of the Southern Division of the United States District Court for the Northern District of California, held at the Court Room thereof, in the City and County of San Francisco, on Tuesday, the 31st day of May, in the year of our Lord one thousand nine hundred and thirty-eight.

Present: the Honorable Michael J. Roche,
District Judge.

[Title of District Court and Cause.]

The parties hereto being present as heretofore, the further trial hereof was thereupon resumed. Mr. Marrin made and filed a motion to strike defendant's exhibits WWW and O-4 from the record on the grounds stated in the motion and Mr. Alexander joined in said motion on behalf of the cross-defendants Surety Companies, which said motion was ordered submitted. Mr. Marrin made and filed a

motion of Plaintiff for Special Findings of Fact and Conclusions of Law and for judgment in its favor, and thereupon Mr. Alexander joined in the motion. After hearing the attorneys for the respective parties, it is Ordered that the motion for judgment in favor of the defendant on the right of the plaintiff to rescind be and the same is hereby granted and that judgment be entered accordingly upon Special Findings of Fact and Conclusions of Law to be prepared by the defendant in accordance with Rule 42 of this Court. Thereupon Mr. Alexander made a motion for Special Findings of Fact and Conclusions of Law on all the issues involved herein. Wallace B. Boggs was recalled by the defendant. Mr. Alexander made a motion to dismiss the cross-complaint as to the cross-defendants Surety Companies on the grounds stated. Mr. Smith made a motion to dismiss the cross-complaint as to the cross-defendant Six Companies of California on the grounds stated. Ordered that defendant's motion to strike plaintiff's Exhibits 22 and 23 be granted and plaintiff and cross-defendants, Surety Companies allowed an exception. Ordered that the plaintiff's motion to strike defendants Exhibits WWW and O-4 from the record be denied and plaintiff and cross-defendants Surety Companies allowed an exception. After argument, it is Ordered that the motions to dismiss the cross complaint be and the same are hereby submitted. Ordered that the further trial hereof be and the same is hereby continued until 10 o'clock a. m. tomorrow. [113]

At a Stated Term of the Southern Division of the United States District Court for the Northern District of California, held at the Court Room thereof, in the City and County of San Francisco, on Wednesday, the 1st day of June, in the year of our Lord one thousand nine hundred and thirty-eight.

Present: the Honorable Michael J. Roche,
District Judge.

[Title of District Court and Cause.]

The parties hereto being present as heretofore the further trial of this cause was thereupon resumed. The motions to dismiss the cross-complaint having been heretofore submitted, it is, by the Court, Ordered that said motions be and the same are hereby denied and the cross-defendants be and they are hereby allowed an exception to the ruling of the Court. Wallace B. Boggs was recalled and further testified on behalf of the defendant on its cross-complaint. Mr. Tinning introduced in evidence and filed defendant's exhibits X-1 to X-115. Mr. Wittschen filed a Dismissal as to certain cross-defendants and made a motion to dismiss the cross-complaint as to certain cross-defendants, and after hearing had, it is Ordered that said motion be and the same is hereby granted and that the Cross-Complaint of the defendant and cross-complainant be and the same is hereby dismissed without prejudice as against cross-defendant Fireman's Fund Indemnity Company, a California Corporation and

Pacific Indemnity Company, a California corporation, only, and it is Ordered that an exception be noted to the ruling of the Court. Mr. Wittschen made a motion to amend the cross-complaint on the face thereof and after argument by the attorneys it is Ordered that said motion be and the same is hereby granted, and it is further ordered that said amendments be deemed to be denied by each of the cross-defendants. Ordered that the further trial hereof be continued until tomorrow at ten o'clock a. m. [114]

[Title of District Court and Cause.]

DISMISSAL OF ACTION AS TO CERTAIN CROSS-DEFENDANTS. [115]

Defendant and Cross-Complainant Joint Highway District No. 13 of the State of California, a public corporation, hereby dismisses without prejudice its cross-complaint as against cross-defendants Fireman's Fund Indemnity Company, a California corporation, and Pacific Indemnity Company, a California corporation, only.

Dated: June 1, 1938.

ARCHIBALD B. TINNING
T. P. WITTSCHEN

[Endorsed]: Filed June 1, 1938. [116]

At a Stated Term of the Southern Division of the United States District Court for the Northern District of California, held at the Court Room thereof, in the City and County of San Francisco, on Thursday, the 2nd day of June, in the year of our Lord one thousand nine hundred and thirty-eight.

Present: the Honorable Michael J. Roche,
District Judge.

[Title of District Court and Cause.]

The parties hereto being present as heretofore the further trial hereof was thereupon resumed. Wallace B. Boggs was recalled and further testified on behalf of the defendant and cross-complaint. Mr. Tinning introduced in evidence and filed defendant's exhibit X-116. Joseph Barlow Lippincott and H. A. Van Norman were sworn and testified on behalf of the defendant and cross-complaint. Thereupon the defendant and cross-complainant rested and the evidence was closed. Mr. Wittschen on behalf of the defendant and cross-complainant made a motion for judgment in its favor and made a motion for special findings of fact and conclusions of law on its cross-complaint in its favor against the plaintiff and cross-defendant Six Companies of California and the several Surety Companies now before the Court. Mr. Smith on behalf of the plaintiff and cross-defendant Six Companies of California made a motion to strike out certain evidence and Mr. Alexander on behalf of the Surety Companies joined in said motion. Mr.

Marrin on behalf of the plaintiff and cross-defendant made and filed a motion for Special Findings of Fact and Conclusions of Law and for judgment in its favor on the counter-claims of the defendant; and made a motion on behalf of the plaintiff and cross-defendant Six Companies of California for Special Findings of Fact and Conclusions of Law and for Judgment in its favor on the cross-complaint of defendant and cross-complainant. Mr. Alexander on behalf of the cross-defendants Surety Companies made a motion for judgment in favor of said Surety Companies, on the grounds stated. After argument by Mr. Wittschen on behalf of the defendant and cross-complaint, it is Ordered that the further trial hereof be continued and the same is hereby continued until Tuesday, June 7, 1938, at ten o'clock a. m. [117]

[Title of District Court and Cause.]

STIPULATION CONSENTING TO AMENDMENT TO ANSWER AND CROSS-COMPLAINT

It Is Hereby Stipulated and agreed by and between the parties hereto, represented by their respective attorneys, that defendant and cross-complainant, Joint Highway District No. 13 of [118] the State of California, a public corporation, may amend its answer and cross-complaint in the following particulars:

1. That on page 22, line 11, paragraph IV, of its counter-claim said defendant and cross-complainant may insert the figures $591,325.47 in place and in lieu of the figures $579,180.46.

2. That on page 34, line 25, paragraph X, of its cross-complaint said defendant and cross-complainant may insert the figures $591,325.47 in place and in lieu of the figures $579,180.46.

That upon the filing of this stipulation the Clerk of the above-entitled Court may make said corrections upon the face of said answer and cross-complaint and that no amended pleading need be filed.

Dated: July 21, 1938.

OPINION.

Roche, District Judge:

This is an action for damages for breach of contract. It is submitted to the court in the form of a

cross-complaint, brought by the Joint Highway District No. 13, a public corporation of the [121] state of California, hereafter called the District, against the Six Companies of California, a Nevada Corporation, licensed as a contractor in the State of California, and numerous foreign corporations, sureties on the Six Companies' bond. Hereafter the Six Companies will also be referred to as the Contractor.

On July 1, 1936, litigation was begun by the Six Companies, which sought to recover $3,259,659.04, the balance claimed to be due for work done and materials furnished to the District. An answer and cross-complaint were filed by the District, which denied any indebtedness and set forth its own claims.

The District's cross-complaint alleges that on June 4, 1934, the District, in accordance with its authority, entered into a contract with the Six Companies whereby the latter agreed to undertake a project for the construction of a highway and highway tunnels and to furnish a faithful performance bond to the District. The surety companies, which have been joined as cross-defendants, were made jointly and severally liable with the Contractor upon the bond.

The District further alleges as follows: On June 13, 1936, the Six Companies abandoned their work, which was then about 70% completed. The Six Companies claimed the right to rescind the contract on several grounds, which were set forth in the

notice delivered to the District upon the cessation of work by the Contractor. The District promptly notified the Contractor and the surety Companies that they must proceed with their work; that if the job were not resumed, the District would have the project completed and would hold the Contractor and the sureties liable for the cost. Neither the Six Companies nor the sureties resumed construction and The District, after calling for bids, let contracts to other corporations for the completion of the work at a cost of $1,751,611.74. [122]

The cross-complaint acknowledges that the District has retained $224,560.79, or 10% of the contract price for work done prior to May 1, 1936; that the District has in its possession an additional $265,891.82 for work performed by the Companies after May 1, 1936; that the District is holding $2,806.55 on behalf of the Companies for past work performed; that these three amounts total $493,259.16, from which sum must be deducted $10,000.00 retained by the District as liquidated damages, thus leaving a credit of $483,259.16. The District claims that the difference between the reasonable cost of completing the work and the contract price for the uncompleted work is $591,325.47. This sum, less the above mentioned $483,259.16 still retained for the Six Companies, leaves $108,066.31 as the reasonable cost of completing the work necessitated by the Six Companies' default.

The District alleges that it became necessary for it (a) to protect and maintain the work at a rea-

sonable cost of $47,944.33; (b) to measure the work at a reasonable cost of $5,134.22; (c) to readvertise for bids at a reasonable cost of $1,862.45; (d) to procure insurance at a reasonable cost of $14,060.85. These sums total $69,001.85. Furthermore, it is alleged that there was a delay of 433 days in the completion of the work directly attributable to the delay and abandonment on the part of the Six Companies. This was a reasonable period for the District to take to complete the project. It is extremely difficult to estimate all of the damages caused by the delay in the completion of the work. Liquidated damages of $500.00 per day for this delay are asked by the District in accordance with #4 (d) of the contract, which reads as follows:

> "(d) Damages for Delay.—The Parties hereto expressly stipulate and agree that time is the essence of this contract. In case the work is not completed within the time specified in the contract or within such extensions of the contract time as may be allowed as herein provided, it is distinctly understood and agreed that the contractor shall pay the District as agreed and liquidated damages and not as a penalty five hundred dollars ($500.00) for each and every working day which may elapse between the limiting date as herein provided and the date of actual [123] completion of the work, said sum being specifically agreed upon as a measure of the damage, to the District by reason of delay in the completion of the work;

it being expressly stipulated and agreed that it would be impracticable to estimate and ascertain the actual damages sustained by the District under such circumstances, and the Contractor agrees and consents that the amount of such liquidated damages so fixed, shall be deducted and retained by the District from any money then due, or thereafter to become due, the Contractor."

The District asks for a judgment against the Companies in the sum of $383,568.16, based on the allegations of the reasonable cost of completing the work, less credits, plus interim expenditures, plus damages caused by delay.

The Contractor and the sureties, in their answer to the cross-complaint, allege that the District had breached the contract by failing to furnish lines and grades as required by the contract, by not granting the contractor an extension of time to complete the work, by deducting liquidated damages from a progress payment made to the Contractor by the District; and finally it is alleged that the District presented plans and specifications to the Contractor which were deceiving and misleading in that the Six Companies were led to believe that the ground to be encountered in driving the tunnels would be found to be self-supporting and require little timber re-inforcement during construction, but that actually the entire tunnels needed timber, thus causing the Contractor to do more excavation

than planned and furnish more concrete than anticipated.

After a hearing, the Court ruled against the Six Companies on the common counts, and concluded that the plaintiffs were guilty of a breach of contract. Thus it follows that the District is entitled to relief on its cross-complaint and the only remaining question concerns itself with the amount of damages which must be awarded to the District.[1] The problem may be stated as follows: When a builder breaches a contract by reason of an abandonment, and such a contract contains a liquidated damage clause, to what extent is the builder liable in damages? [124]

There is no dispute as to the accuracy of the various damage figures presented by the District. But the Companies, assuming a breach of contract as found by the court, deny that they are liable for liquidated damages or for the interim expenditures. The Companies assert that the provision for liquidated damages can have no application to a delay occurring after the contract has been abandoned. They further maintain that even if the provision for liquidated damages is applicable, it must be held to be unenforceable because it is a penalty.

In support of the contention that a provision for liquidated damages is inapplicable to a situation in

---

1. The surety companies are jointly and severally liable under the Six Companies' bond. Certain technical defenses, which the sureties suggest might absolve them from liability, do not impress the Court.

which delay occurs because of abandonment, the Companies rely chiefly upon two California cases, namely Bacigalupi v. Phoenix Bldg. Construction Co. (1910) 14 Cal. App. 632 and Sinnott v. Schumacher (1919) 45 Cal. App. 46. These cases hold that a plaintiff may sue for actual damages when a defendant has breached his contract, notwithstanding a liquidated damage clause in the agreement. But this is not to say that a plaintiff, or cross-complainant, may not act upon the liquidated damage provision in a contract when he seeks damages for delay caused by an abandonment. That he may rely on such a clause is recognized in Southern Pacific Co. v. Globe Indemnity Co. (1927) 21 F2d 288, where a question much like the one in the principal case arose. There the court held that the aggrieved party may recover liquidated damages for delay, whether the contract is abandoned or not, the court saying:

> "It is urged that a liquidated damage clause does not apply when work under the contract is abandoned by the contractor * * * A close examination of the cases, however, does not in our opinion establish such a rule, and we can see no justification for it, at least when the contractor abandons after the time for completion has passed. In such a case some part of the liquidated damages has accrued before the repudiation. No intelligible reason has been suggested why the owner should lose his right to them because of subsequent repudiation.

"* * * In these cases (Bacigalupi v. Phoenix Co. and like decisions), the plaintiff made no claim to collect liquidated damages for delay, as well as the increased cost of completing the abandoned work. They are not, therefore, authorities for the alleged rule that he cannot do so * * *" [125]

The Court then ruled that the plaintiff was entitled to liquidated damages for the time the original contractor would have taken to complete the job, had he remained at work.

The cases which are mentioned and distinguished in this opinion, and a statement made by Williston (Vol. 3 #785), and based upon these same cases, are relied upon by the Six Companies. The Reasoning in the Southern Pacific decision—which is in accord with City of Reading v. U. S. Fidelity, etc. Co. (1937) 19 F. Supp. 350, and School District v. U. S. Fidelity and Guarantee Co (1915) 152 P. 668—is sound and applies in the case before the Court.

Adopting the rule that a liquidated damage provision in a contract must be enforced, whether or not delay in completion is caused by abandonment, the question then arises as to the length of the period for which such damages may be recovered. Obviously, the per diem arrangement does not run during the entire period of delay. This much the District itself recognizes, for it asks for damages for 433 days, although over 500 days elapsed between the time the project was supposed to have

been completed and the date the work was actually finished. The 433 days are made up of three periods: 264 days (reasonable time), for the actual finishing of the tunnels and highway by new contractors; 20 days of work for the Six Companies themselves after the contract time limit had expired; 149 days between the date of abandonment and the date work was resumed. How many of these days should be allowed in fixing the period for which liquidated damages are recoverable?

In McCormick on "Damages" at page 619 this statement is found: The delay provision applies "to this extent, that the owner may recover for the delay through the period that would have been consumed by the contractor if he had, instead of the owner, carried the work to completion." Under this rule, the [126] first two periods may properly be tabulated in ascertaining the time necessary to carry out the project if the Six Companies had themselves completed the work. But the third item—the lapse of time during which no work was done—may not be considered. It may be argued that it is unfair to disregard the gap between construction periods, for it is impossible to avoid such delay. This is true, but the Court believes that the rule as stated by McCormick is both practical and in accordance with the intent of the parties to the contract, even though it may work a hardship in certain cases. By refusing to award damages for the total period of delay, the temptation to procrastinate in employing new contractors is diminished.

And even when the employer acts in good faith and with as much speed as possible, as in the case at bar, there are many factors which may operate to prolong the period of inactivity indefinitely, such as the District's inability to get bids from new contractors. To allow per diem damages to accrue during such a period of suspension in operations would be neither fair nor in accordance with the intent of the parties. Furthermore, the liquidated damage clause in the contract before the court refers to "every *working day** which may elapse between the limiting date . . . and the date of actual completion"—and not simply to the total lapse of time between the start and the finish of the project. This contract language necessarily leads the court to follow the McCormick rule.[2] In the normal case, the delay provision applies to the original contractor; in our case, which is exceptional, it applies to the time the Six Companies *would have taken* had they completed the job themselves—and this time is measured by the period reasonably required by the new contractors to finish the project. The intent of

---

2. In School District v. U. S. Fidelity and Guarantee Co. (1915) 152 P. 668 liquidated damages were allowed for the reasonable period of delay, including the period of inactivity. We do not believe that such an award was incorrect in view of a contract provision allowing damages for each day beyond a certain time until the work was completed, but we think that the contract and the facts in the principal case do not warrant the inclusion of the gap between abandonment and recommencement of work.

*Italics in this Opinion are by the Court.

the parties is to determine the harm caused by the late completion of the work; liquidated damages must be limited to such a period. [127]

There is no merit in the contention of the Six Companies that the liquidated damages provision is void. Section 1670 of the California Civil Code, while declaring fixed damage clauses invalid in many contracts, is followed by an exception which applies directly to the facts found in the principal case. The exception is contained in Section 1671 of the Cal. C. C. which reads: "The parties to a contract may agree therein upon an amount which shall be presumed to be the amount of damage sustained by a breach thereof, when, from the nature of the case, it would be impracticable or extremely difficult to fix the actual damages." Clearly the contract between the District and the Six Companies comes within this exception. The injury suffered by the District through delay in performance cannot be measured accurately. It is known that the cost of maintaining the District is $272.89 per day; but how can the harm caused by the lack of use of the highway and highway tunnels be determined? The interest on the bonds amounting to about $200.00 per day is not a yardstick for measuring such damages. Even if the maintenance cost and the interest are looked upon as a rough approximation of the injury suffered by the District, they do not take the case out of the exception; they merely indicate that the $500.00 liquidated damage provision in the contract comes close to measuring actual damages.

Furthermore, at the time the contract was drawn up, there was no accurate way of measuring the injury which might be suffered through delay in completing the project and thus preventing its use. Hanlon Dry Dock Co. v. McNear (1886) 70 Cal. 204, 210, and P. Factor Co. v. Adler (1891) 90 Cal. 110, both hold that if the damages are not measurable at the time the contract is entered into, then a liquidated damage provision is valid; nor is it nullified by the fact that it may be called a penalty. The Supreme Court has also sustained such liquidated damage provisions, even in the absence of proof of any actual damages (U. S. v. Bethlehem Steel Co. (1906) 205 U. S. [128] 105, Wise v. U. S. (1918) 249 U. S. 361, Robinson v. U. S. (1922) 261 U. S. 486 and other cases). The provision in the principal case is valid.[3]

---

3. It is necessary that an adjustment be made in the allocation of damages in the principal case. The District has deducted $10,000.00 from the amount which is being held for the cross-defendants. This sum of $10,000.00 represents liquidated damages for the 20 days' delay by the Six Companies before their abandonment. Thus the District has figured an element of liquidated damages in its determination of the reasonable cost of completing the project. This we believe to be error, even though the District is entitled to the $10,000.00 quite apart from the Court's ruling on the general question of liquidated damages. The entire sum due the District as liquidated damages should be computed as a unit—264 days by new contractors plus 20 days by the Six Companies. There must be no confusion between liquidated damages and reasonable costs.

The assertion of the Six Companies that they are not liable for the interim expenditures does not warrant serious consideration. The costs of maintaining the work after abandonment, of calling for new bids and of making other necessary expenditures for keeping the project in order until work could be resumed, obviously spring directly from the breach of contract and are recoverable as damages. The reasonableness of the amounts has neither been refuted nor seriously challenged; the evidence sustains them.

Accordingly, the Court holds that the District is entitled to the interim expenditures of $69,001.85, plus the reasonable cost of completing the project of $98,066.31, plus liquidated damages for the period of 284 days of $142,000.00, or a total of $309,068.16; that each surety company cross-defendants which have continued to be a party to this action, are liable for the percentage which they assumed on the Six Companies' bond; that costs of this suit be paid by cross-defendants; that findings of fact and conclusions of law be prepared by the District pursuant to Rule 42 of this Court. [129]

Dated: August 8th, 1938.

MICHAEL J. ROCHE
United States District Judge.

[Endorsed]: Filed Aug. 8, 1938. [130]

[Title of District Court and Cause.]

REQUEST FOR SPECIAL FINDINGS OF FACT AND CONCLUSIONS OF LAW.

Defendant and Cross-Complainant, Joint Highway District No. 13 of the State of California, a public corporation, requests the Court to find the following facts and to enter the following conclusions of law all in accordance with findings of fact and conclusions of law hereto attached.

Dated: August 12th, 1938.

ARCHIBALD B. TINNING
T. P. WITTSCHEN
Attorneys for Defendant and Cross-Complainant. [132]

[Title of District Court and Cause.]

FINDINGS OF FACT AND CONCLUSIONS OF LAW. [133]

The above-entitled cause came on regularly for trial before the above-entitled court, Honorable Michael J. Roche Judge presiding, without a jury, a jury having been expressly waived by written stipulation of all the parties hereto heretofore filed in the above-entitled court and cause. Said trial began on the 12th day of April, 1938; plaintiff and cross-defendant Six Companies of California appearing by its counsel Messrs. Thelen & Marrin, DeLancey C. Smith, Eugene E. Trefethen and J.

Paul St. Sure; defendant and cross-complainant, Joint Highway District No. 13 of the State of California, appearing by its counsel Archibald B. Tinning, Esq. and T. P. Wittschen, Esq.; and the cross-defendant Surety Companies above named appearing by their counsel Messrs. Redman, Alexander & Bacon.

Upon motion of the defendant and cross-complainant, duly and regularly granted by the court, the cause of action stated in the cross-complaint of defendant and cross-complainant Joint Highway District No. 13 of the State of California was dismissed as to cross-defendants Fireman's Fund Indemnity Company, a California corporation, and Pacific Indemnity Company, a California corporation.

The court proceeded with the trial of said cause from day to day until concluded, and testimony and exhibits were introduced on behalf of the parties to said action, and at the conclusion of taking said testimony and offering of documents the case was duly argued and submitted; and now the court having fully considered the facts and being duly advised in the premises makes and renders its decision herein comprising Findings of Fact and Conclusions of Law as Follows:

FINDINGS OF FACT.

I.

Finds that plaintiff, Six Companies of California, was [134] at all the dates and times herein mentioned and still is a corporation duly incorpo-

rated, organized and doing business as such corporation under and by virtue of the authority of the laws of the State of Nevada, and is now and at all the times herein mentioned was and has been a citizen of the State of Nevada.

II.

Finds that defendant, Joint Highway District No. 13 of the State of California, is now and at all the dates and times herein mentioned was and has been a public corporation duly organized and existing under and by virtue of the authority of the laws of the State of California, and is now and at all the dates and times herein mentioned was and has been a citizen of the State of California.

III.

Finds that the proceeding herein is one of a civil nature and the parties were at all the dates and times herein mentioned and still are citizens of different states; that the sum involved herein, exclusive of costs and interest, is in excess of the sum of $3,000, the claim of said plaintiff in the prayer of its complaint being for the sum of $3,259,695.04.

IV.

Finds that the grounds upon which the jurisdiction of this court depends are as follows:

(a) The existence of diversity of citizenship between the parties plaintiff and defendant, and that the suit is one of a civil nature between citizens of different states; and

(b) The amount in controversy exceeds, exclusive of interest and costs, the sum of $3,000.

V.

Finds it is not a fact that within two years last past or ever or at all said defendant became indebted to plaintiff in [135] the sum of $5,280,742.15 or in any other sum at all for work done or labor performed or materials furnished by said plaintiff to defendant at the special instance or request of said defendant or otherwise, and the court expressly finds said defendant is not indebted to plaintiff in the said amount or in any sum at all and that there is no sum due or owing or unpaid from defendant to plaintiff on account of the reasonable value of any work done or labor performed or materials furnished by plaintiff for defendant or otherwise.

VI.

Finds that at all times during the performance by plaintiff of any work for defendant as herein alleged plaintiff was a duly licensed contractor under the laws of the State of California.

VII.

Finds that on the 4th day of June, 1934, a contract in writing was duly and regularly entered into between defendant and plaintiff, wherein and whereby plaintiff as contractor agreed with defendant as owner that the said plaintiff pursuant to the terms of said contract and for and on behalf of defendant would construct, erect and complete a cer-

tain project of said defendant, which project included a highway, highway tunnel and approaches with appurtenant structures, including ventilation buildings, ventilation equipment and accessories, and the construction of highway approaches with pavement, drainage structures, curbs, gutters and sidewalks where required, construction of grade separation structures, viaducts, retaining walls and incidental structures, and connections with existing streets, all as described in [136] said contract between the said parties, which project is located within the boundaries of said defendant District and partly within the City of Oakland, County of Alameda, State of California, and partly within the County of Contra Costa, State of California, all in accordance with the final surveys, plans, specifications and detailed drawings therefor, together with the amendments and supplements to said specifications dated January 9, 1934 and April 3, 1934, theretofore adopted by the Board of Directors of said Joint Highway District No. 13, and which contract, plans and specifications and amendments at all times herein mentioned had been on file in the office of said defendant District, and which said contract, plans and specifications and amendments have been duly admitted in evidence in this action.

VIII.

Finds that upon the letting of said contract plaintiff did commence the construction of said project and did continue the said work, receiving

each month from defendant the monthly progress payments provided for in said contract for work done during the preceding month, which payments so made by defendant to plaintiff and accepted and retained by plaintiff up to the 13th day of June, 1936, amounted to $2,021,047.11.

IX.

Finds that on the 13th day of June, 1936, and after plaintiff had been so engaged on said work for approximately a period of two years plaintiff quit and abandoned said work and refused to proceed further with the performance of said contract, and did deliver to defendant a notice of abandonment and attempted [137] rescission in the words and figures as follows:

"June 13, 1936

Joint Highway District No. 13
of The State of California,
1448 Webster Street,
Oakland, California.

Gentlemen:

You are hereby notified that the undersigned, Six Companies of California, has elected to and does hereby terminate and rescind the contract dated June 4, 1934, between the undersigned and your District for the construction, erection and completion of the project of said Joint Highway District No. 13 of the State of California, which includes a highway, highway tunnels, and approaches with the

appurtenant structures located partly in the City of Oakland, County of Alameda, State of California, and partly in the County of Contra Costa, State of California, commonly known as the Broadway Tunnel Project.

Said rescission is made upon the following grounds and each and all of them:

First: Through your fault the consideration for our obligations under said contract has failed in part in that you have failed and refused to pay us the amount estimated by you to be due us under the monthly estimate for work done during the month of May, 1936. Said failure consists in the deduction by you from the amount estimated by you to be due us for such work of the sum of $3,500 for claimed damages for failure to complete the work under said contract, said deduction being computed at the rate of $500 per day for each day in May 1936 following May 24th, and to and including the 31st day of May, and including such a deduction for a legal holiday, May 30, and a nonworking day, Sunday, May 31st. Said deduction was and is contrary to and in violation of the terms of the contract in that we were and are entitled as a matter of right and of law to an extension of time thereunder for performance of same to a date after May 31, 1936; and was and is further in violation of the provisions of the said contract in that any dam-

ages for delay in completion of the contract can only be asserted or claimed against the contractor for working days after the contract date for completion.

Second: That the consideration for said contract has failed in a material respect in that you have breached said contract by refusing to pay us the amount due us under your monthly estimate for work done during the month of May, 1936. Said failure consists in the deduction by you from the amount due us for such work of the sum of $3,500 for claimed damages for failure to complete the work under said contract within contract time, said deduction being computed at the rate of $500 per day for each day in May, 1936 following May 24th, and to and including the 31st day of May, and including such a deduction for a legal holiday, May 30th, and a non-working day, Sunday, May 31st. Said deduction was [138] and is contrary to and in violation of the terms of the contract in that we were and are entitled as a matter of right and of law to an extension of time thereunder for performance of same to a date after May 31, 1936; and was and is further in violation of the provisions of the said contract in that any damages for delay in completion of the contract can only be asserted or claimed against the contractor for working days after the contract date for completion.

Third: That in failing to pay said sum mentioned in numbered paragraphs First and Second above and by your refusal to grant said extension of time you have breached said contract, and ground for rescission has arisen in our favor.

Fourth: That your failure and refusal to grant us the extensions of time to which we are entitled as a matter of right and of law for completion of said contract after May 24, 1936, although we have repeatedly requested the grant of such extensions is a breach of the contract.

Fifth: Because the ground encountered in the excavation for the tunnels provided for in the contract has been and is entirely and radically different from the character of ground represented to the contractor as that which would be encountered, and which was contemplated and predicted by the contract, geological report, specifications, plans and any and all other documents forming a portion or part thereof.

Sixth: For your failure and refusal to furnish points, lines and grades for us to work to and other engineering work in the construction of the tunnels as is required to be done or furnished by you by the terms and provisions of the contract and specifications forming a part thereof.

lay and continue to delay the work you contracted to perform, and your attempted rescission and termination of the contract, and each and all of them, constitute wilfull breaches of the contract by you.

You are further advised that unless you as said contractor resume work on the project and perform the same in accordance with all of the terms thereof within three (3) days of the date of your receipt of this letter, that this District will consider your acts and conduct as aforesaid a final abandonment of the contract and the work to be [140] done thereunder, and the District will proceed to complete the same in accordance with the provisions of the contract, and that the District will hold you and your bondsmen liable for any and all costs thereof in excess of the contract price and any and all damages to this District by reason of your wilfull abandonment of the work in violation of the terms of your contract with this District dated June 4, 1934.

Yours very truly,
JOINT HIGHWAY DISTRICT
NO. 13 OF THE STATE OF
CALIFORNIA,
By L. V. EATON,
Assistant Secretary."

That the notice and letter in this paragraph referred to was received by the plaintiff on the day it bears date.

XI.

Finds that on the 13th day of June, 1936, plaintiff ceased all work under said contract and on said project, and on said date refused and ever since said date has refused and still continues to refuse to proceed further therewith, and that on said date said defendant wrongfully abandoned the said work and contract between plaintiff and defendant.

XII.

Finds:

(1) That at all times said contract between plaintiff and defendant provided that the work to be done under said contract by plaintiff for defendant should be completed within 720 calendar days from and after the execution of said contract, and it was stated in said contract that time was of the essence of said agreement and said contract between plaintiff and defendant so provided; that the said 720 days for completion of said contract expired on May 24, 1936.

(2) That it is provided in paragraph 3 of said contract that the whole of said work is to be done by plaintiff to the satisfaction and approval of defendant and in strict accordance with the plans and specifications entered into between the parties. [141]

(3) That it is further provided in paragraph 4 of said agreement that the plaintiff is skilled in the trade or calling necessary to perform the work agreed to be done under the agreement and that the defendant not being skilled in such matters

relied upon the skill of plaintiff to do and perform the work and labor necessary in the most skillful and durable manner.

(4) That the specifications for said work are expressly made a part of said contract.

(5) Section 2, subparagraph (b) of said specifications read as follows:

> "Estimates of Quantities.—Where estimates of quantities are given on the Proposal Form, or in 'Notice to Contractors,' or in any Contract executed hereunder, it is hereby declared and shall be understood that such quantities are approximate only, being given as a basis for comparison of bids. The District does not expressly or by implication agree or guarantee that the actual amount of work will correspond therewith, but reserves the right to increase or decrease the amount of any class or portion of the work, or to omit portions of the work as may be deemed necessary or expedient by the District Engineer."

(6) Section 2, subparagraph (c) of said specifications, reads as follows:

> "Examination of Plans, Specifications and Site of Work.—The bidder is required to examine carefully the site of the work, the Proposal Form, and plans, specifications and contract forms for the work contemplated. The submission of a Proposal shall be considered prima facie evidence that the bidder has made

such an examination and is satisfied as to the conditions to be encountered, as to the character, quality and quantities of work to be performed and materials to be furnished, and as to the requirements of the specifications, plans and contract, or contracts."

(7) Section 4, subparagraph (a) of said specifications reads as follows:

"Commencement of Work.—The Contractor shall commence work within ten (10) days after the execution of the contract for the work by the Board of Directors and shall continue without interruption unless otherwise directed by the District. At least three (3) days before starting, the Contractor shall notify the District Engineer in writing of the date that work is to commence." [142]

(8) Section 4, subparagraph (b) of said specifications reads as follows:

"Completion of Work.—The time of completion of the entire work specified herein shall be within a period of seven hundred and twenty (720) calendar days from the date of the execution of the contract by the Board of Directors."

(9) Section 4, subparagraph (c) of said specifications reads as follows:

"Extension of Time.—The time during which the Contractor is delayed in said work by Acts

of God, or by stormy or inclement weather or by any reason which, in the judgment of the District Engineer, unavoidably delays the work, shall be added to the aforesaid time for completion, provided that the Board of Directors approve in advance the written application therefor, which must be made by the Contractor for such an extension, before the expiration of the time limit fixed herein, or a duly granted extension thereof."

(10) Section 4, subparagraph (d) of said specifications reads as follows:

"Damages for Delay.—The parties hereto expressly stipulate and agree that time is the essence of this contract. In case the work is not completed within the time specified in the contract or within such extensions of the contract time as may be allowed as herein provided, it is distinctly understood and agreed that the Contractor shall pay the District as agreed and liquidated damages and not as a penalty five hundred dollars ($500.00) for each and every working day which may elapse between the limiting date as herein provided and the date of actual completion of the work, said sum being specifically agreed upon as a measure of damage to the District by reason of delay in the completion of the work; it being expressly stipulated and agreed that it would be impracticable to estimate and ascertain the actual damages

sustained by the District under such circumstances; and the Contractor agrees and consents that the amount of such liquidated damages so fixed, shall be deducted and retained by the District from any money then due, or thereafter to become due, the Contractor.

(11) Section 5, subparagraph (a) of said specifications as amended on April 3, 1934, reads in so far as material as follows:

"Partial Payments: Payments will be made only upon the certificate of the District Engineer for work actually performed. The District Engineer shall measure the work on or about the first day of each month and at the time of completion of the entire work, and shall render a certificate on or about the tenth day of each month and at the completion of the entire work, stating the amount of work performed during the previous calendar month, and during the current month, at the time of completion. The Contractor shall then, at the times above specified, be entitled to receive a payment from the District in an amount to be determined as follows: [143]

Until the total value of the work done since commencement of performance of the contract exceeds Four Hundred Thousand Dollars ($400,000.00) the payment will be seventy-five per cent (75%) of the amount specified in the District Engineer's certificate; thereafter and

until the total value of the work done since the commencement of performance of the contract equals One Million Dollars ($1,000,000.00), the constant sum of One Hundred Thousand Dollars ($100,000.00) will be retained by the District out of said total value; thereafter the progress payment will be ninety per cent (90%) of the amount specified in the Engineer's certificate, provided that no such estimate of payment shall be required to be made when, in the judgment of the District Engineer, the work is not proceeding in accordance with the provisions of the contract, or when, in his judgment, the total value of the work done since the last estimate amounts to less than Five Hundred Dollars ($500.00), except the certificate and payment required at the completion of the entire work.

The acceptance by the Contractor of the final ninety per cent (90%) payment for the completed work shall be and shall operate as a release to the District from all claims and liability to the Contractor for anything done or furnished for or relating to the work or for any act or neglect of the District or its agent in any way affecting the work, excepting the claim of the Contractor against the District for the moneys herein provided to be paid by the District to the Contractor thirty-five (35) days after the acceptance of the contract."

Subparagraph (b) reads as follows:

> "Final Payments: Thirty-five (35) days after the acceptance of the work by a certificate of acceptance duly rendered by the District Engineer and final approval and acceptance by the Board of Directors of the District, the Contractor shall be entitled to receive a payment of the balance due under this contract in the amount of ten per cent (10%) of the aggregate amount of all certificates of the District Engineer."

Section 7 of the contract dated June 4, 1934, providing for payments by defendant to plaintiff, is identical with the foregoing provisions of Section 5 of the specifications.

(12) Section 6, subparagraph (b) of said specifications reads as follows:

> "Authority of District Engineer.—The District Engineer shall decide any and all questions which may arise as to the quality or acceptability of materials furnished and work performed and as to the manner of [144] performance and rate of progress of the work, and shall decide all questions which may arise as to the interpretation of the plans and specifications, and all questions as to the acceptable fulfillment of the contract on the part of the Contractor and as to compensation. His decisions shall be final and he shall have executive authority to enforce and make effective such decisions and orders as the Contractor fails promptly to carry out."

(13) Section 6, subparagraph (c) of said specifications reads as follows:

"Compliance with Specifications.—It shall be the duty of the Contractor to see that the provisions of these specifications are complied with in detail, irrespective of the inspection of the work during its progress by the District Engineer or his representatives."

(14) Section 6, subparagraph (d) of said specifications reads in so far as material as follows:

"Inspection. — The Contractor shall afford every facility necessary for the safe and convenient inspection of the work throughout its construction and for inspection of materials used or to be used. The District Engineer shall have power to reject material and workmanship which are not in accordance with specifications, and all such must be removed promptly by the Contractor and replaced to the satisfaction of the District Engineer without extra expense to the District.

The failure of the District Engineer or his representatives to discover and condemn work not in accord- [145] ance with the specifications shall not relieve the Contractor of his obligation to the District to furnish proper materials and work as provided in these specifications; nor shall it relieve the Contractor from being compelled to remove and replace promptly any work found to be defective at any time during

the construction of the work, or before the final acceptance of the work."

(15) Section 6, subparagraph (e) of said specifications reads as follows:

"Disputes.—To prevent disputes and litigation the District Engineer shall in all cases determine the amount, quality and acceptability of the work and materials which are to be paid for under these specifications. He shall determine all questions in relation to said work and materials and performance thereof and all questions which may arise relative to the fulfillment or interpretation of these specifications on the part of the Contractor. His estimate and decision shall be final and conclusive, and in case any question shall arise between the Contractor and the District pertaining to the contract, the District Engineer's estimate and decision shall be a condition precedent to the right of the Contractor to receive any moneys under the contract."

(16) Section 6, subparagraph (g) of said specifications reads as follows:

"Alterations.—In case of reduction or increase in quantities of work, by reason of alterations or any cause whatsoever, the Contractor shall accept payment in full at the contract unit prices for the actual quantities of work done and no allowance will be made for anticipated profits due in such reduction or increase."

(17) Section 6, subparagraph (h) of said specications reads as follows:

"Interpretation of Plans and Specifications. —Should it appear that the work to be done or any matters relative thereto are not sufficiently detailed or explained in the plans and specifications, the Contractor shall apply to the District Engineer in writing for such further details and explanations as may be necessary, and he shall conform to the same as part of the contract insofar as they may be consistent with the original specifications and plans. In the event of any doubt or question regarding the true meaning of the specifications, the decision of the District Engineer shall be final. In the event of any discrepancy between any drawing and figures written thereon, figures shall be taken as correct.

Should the Contractor believe that any work ordered is not properly a part of his contract or according to [146] the intent of these plans and specifications, he shall before commencing same notify the District Engineer in writing of his objection to same and shall not perform such work until notified in writing by the District Engineer as to his decision in the matter. The commencement of any such work shall act as a waiver by the Contractor of any objection he may have to the execution of such work, and as a waiver of any claim for extra work in consequence of such order.

These specifications and plans shall be considered as supplementary one to the other, so that materials and workmanship, indicated, called for, or necessarily implied by the one and not by the other, shall be supplied and placed in the work the same as though specifically called for by both."

(18) Section 6, subparagraph (i) of said specifications reads as follows:

"Compliance with Legislation.—The Contractor shall conform to all federal, State, County and Municipal laws, ordinances and regulations, which may apply to the work herein provided for and during the progress thereof, and shall pay for licenses, fees and other charges levied or charged in accordance with such laws, ordinances or regulations, and no claim for extra payment shall be made to the District for such fee, license or charge, it being specifically understood that such licenses, fees or charges are covered by the unit prices bid."

(19) Section 6, subparagraph (k) of said specifications reads as follows:

"Contractor's Liability.—On all work the Contractor is to assume all liability of every kind or nature, arising from said work, either from accident, negligence or any cause whatsoever during the progress of the work and before the final acceptance thereof, and shall

indemnify and hold the District harmless therefrom, and the bonds given by the Contractor shall hold and secure the said District free and harmless from any or all damage or expense whatsoever."

(20) Section 6, subparagraph (m) of said specifications reads as follows:

"Sub-letting and Assignment.—No subcontractor will be recognized as such and all persons engaged in the work of construction will be considered as employees of the Contractor and their work shall be subject to the provisions of the contract and specifications. Where a portion of the work which has been sublet by the Contractor is not prosecuted in a manner satisfactory to the District Engineer, the subcontractor shall be removed immediately on the order of the District Engineer and shall not be employed again upon the work. [147]

"Neither the contract nor any part thereof shall be assigned unless the Board of Directors first consents in writing to such assignment. Such assignment shall not relieve the Contractor or his bondsmen from any liability whatsoever."

(21) Section 6, subparagraph (n) of said specifications reads as follows:

"Contractor Guarantees Work.—It is understood that the Contractor is skilled in the trade or calling necessary to perform the work herein set forth and that the District, not being skilled

in such matters, relies upon the Contractor to do and perform all work necessary, and to do, supply and furnish all the acts and things necessary, at the proper times and in the most skilful and desirable manner, and the Contractor guarantees the workmanship and materials furnished and supplied to be the best of their kind. The acceptance of any part or of the whole of the work does not operate to release the Contractor or his bondsmen from said guarantee."

(22) Section 6, subparagraph (q) of said specifications reads as follows:

"District May Perform Work.—(1) The Contractor agrees that if the work to be done under this contract shall be abandoned, or, if in the opinion of the Board of Directors the work or any part thereof is unnecessarily or unreasonably delayed, or if the same is not prosecuted with the diligence and force specified, meant and intended in and by the terms of the contract; or if the Contractor is wilfully violating any of the conditions or covenants of the contr ..t and specifications or of the plans or of any part of the contract, or is executing the work in bad faith, the said Board of Directors shall then have the power to notify said Contractor to discontinue the work or any part thereof under the contract, and thereupon the Contractor shall cease to continue such work or such part thereof as the Board of Directors may designate.

(2) The said District shall thereupon have the power to place such or so many persons and to obtain by contract, purchase or hire such animals, equipment, tools, materials and labor as the District Engineer may deem necessary to work at and to be used to complete the work herein described, or such part thereof as the District Engineer may deem necessary; and to use such materials as may be found upon the site of the work, and to procure other material for the completion of the work, and to charge the expense of such labor, material, animals, equipment, etc., to the Contractor, and the expense so charged shall be deducted and paid by the District out of such money as may be due or may at any time thereafter become due to the Contractor under and by virtue of this contract or any portion thereof. [148]

"(3) In case such expense is less than the sum which would have been payable under this contract at the unit prices bid, as calculated from the District Engineer's final estimate if the work had been completed by the Contractor, then the Contractor shall be entitled to receive the difference, but in case such expense shall exceed the last said amount then the Contractor and his bondsmen shall be jointly and severally liable to pay the amount of such excess to the District on notice by the District of the amount of excess so due."

(23) Section 6, subparagraph (r) of said specifications reads as follows:

"Temporary Suspension of Work.—The District Engineer shall have the authority to suspend the work wholly or in part for such period as he may deem necessary, due to unsuitable weather, or to such other conditions as are considered unfavorable for the suitable prosecution of the work, or for such time as he may deem necessary due to the failure on the part of the Contractor to carry out orders given, or to perform any provision of the contract. The Contractor shall immediately respect the written order of the District Engineer to suspend the work wholly or in part. The work shall be resumed when conditions are favorable and methods are corrected, as ordered or approved in writing by the District Engineer."

(24) Section 6, subparagraph (s) of said specifications reads as follows:

"Lines and Grades.—The Contractor is to furnish free of charge all stakes necessary for marking and maintaining points and lines given by the District Engineer; and shall give the District Engineer such facilities and materials for giving said lines and points as he may require, and the District Engineer's marks must be carefully preserved.

Sufficient points to line and grade will be set for the Contractor to work to and no additional stakes will be set. Any such stakes or marks

lost, damaged or obliterated shall be replaced at the expense of the Contractor.

The Contractor shall do his own engineering and shall be responsible for the completion of the work to proper lines and grades in conformance with the stakes set by the District Engineer.

The District Engineer shall be furnished facilities for the checking of lines, elevations, grades and forms at all times during the progress of the work. The Contractor shall, without charge to the District, provide openings for and suspend work that will in any way interfere with the surveys, at such times and for such periods as the District Engineer may deem necessary." [149]

(25) The part of said specifications dealing with tunnel construction contains the following provisions:

Section 32, subparagraph 3:

"Safety Rules.—The Contractor shall provide himself with copies of 'Tunnel Safety Rules' and 'General Construction Safety Orders Relating to the Storage and Use of Explosives,' together with all revisions and amendments thereto, as required by the Industrial Accident Commission of the State of California and keep copies of these at the site of the work at all times. He shall consult with officials of the Industrial Accident Commission and inform himself of any and all conditions which they

may require, whether set forth in the published rules or specially provided for on this work. He shall thoroughly familiarize himself with the provisions of said rules and all regulations of said Commission and govern all his operations by the requirements in all particulars where the same are applicable. He shall see to it that all superintendents, foremen and other employees having responsibility for the various phases of the tunnel work are likewise familiar with the provisions referred to above, and that all work is conducted in accordance therewith. The requirements concerning ventilation, general safety precautions, transportation, roof inspection, timbering, electrical installations and use of explosives are of particular importance.

Representatives of the U. S. Bureau of Mines and of the Industrial Accident Commission of the State of California shall be afforded free access to the work at all times and be given every facility for inspecting methods, equipment and familiarity of workmen with the various safety rules and requirements.

All Federal and State regulations for such work or parts thereof and regulations of Counties and Municipalities having local jurisdiction shall be strictly adhered to, and authorized officials representnig the Federal or State governments or Counties or Municipalities having jurisdiction shall be given every facility for inspection and proper enforcement of rules, pro-

visions, regulations and ordinances which may apply to the conduct of the work. The Contractor shall be responsible during the entire progress of the work for the proper enforcement of all such requirements and shall assume all liabilities which may occur due to accidents of any kind or nature. The fact that no apparent violation of rules or regulations has occurred shall not serve to relieve the Contractor of his full liability or responsibility in case of accident or damage to persons, employees, or to any part of the work.

Provisions shall be made by the Contractor for a supply of fresh air sufficient for the safety, comfort and efficiency of all persons engaged in the tunnel construction, at all times in all portions of the work. [150] Provisions shall be made for the quick removal of gases resulting from blasting and frequent tests shall be made for harmful or explosive gases emanating from the rock structure.

Should compliance with safety rules and regulations require special equipment the Contractor shall at all times keep on hand on the work enough of such special equipment to supply, in addition to his own requirements, complete equipment for at least three men, for the use of the District Engineer and his assistants in inspections of the work or in giving lines and grades, or as the District Engineer may direct."

Section 32, subparagraph 4:

"Geological Data.—A preliminary report on geological structures throuph which the tunnel will pass is on file in the office of the District Engineer. This report is available for inspection by prospective bidders at the office of the District Engineer. The Board of Directors of the District and the District Engineer do not guarantee in any respect the accuracy of this report or the findings of recommendations contained therein. The fact that prospective bidders are permitted to inspect this report shall not in any respect relieve prospective bidders of their responsibility to make their own investigations as to the materials which may be encountered or the geological structures, independent and separate from those made by the District, and the Contractor shall have no claim whatsoever for damages, unexpected costs, difficulties, or for the alteration or voiding of the contract, should materials encountered vary in any respect from those indicated in the preliminary report referred to."

Section 32, subparagraph 5(a):

"Excavation of Tunnels: (a) Excavation.—The Contractor shall use approved modern methods in driving and excavating the tunnels, such as will assure a good rate of progress. He shall furnish and install all timbering, lagging and other supports necessary to provide ample security against falling earth or rock, caving or

other movements of the roof, sides or bottom of the excavation. He shall provide for the proper drainage and disposal of water encountered in the excavation.

Before performing any excavation in the tunnel the Contractor shall submit to the District Engineer his proposed method of procedure, giving in detail the various operations leading up to and including the final completed line section, and no such work shall be performed until the approval by the District Engineer of the procedure has been obtained. Such approval by the District Enginere shall not, however, in any way relieve the Contractor of his responsibility for the failure of the method, or for lack of proper progress in his operations. [151]

Section 32, subparagraph 5(b):

"Overbreak.—Excavation shall be of sufficient size to allow for the proper bracing timbering, construction of lining and forms, and drainage. Extreme care shall be taken in making excavation for the tunnel that the minimum of earth or rock shall be removed or allowed to cave or settle outside of the outer periphery of the concrete structure which forms the tunnel lining. However, should the Contractor damage or shatter, in any way, materials lying outside of the neat lines of the concrete structure, or should it become necessary in order to properly support the excavated sections that excess volumes be excavated to permit proper timbering

or other supports, the Contractor shall remove the rock or materials so damaged or excavated, and the space between the neat lines of the concrete structure, and the lines of actual excavation shall be filled with Portland Cement Concrete mixed in the same proprotion and placed at the same time as the concrete in the neat structure, or, when permitted by the District Engineer, dry packed and grouted as hereinafter provided. When timber is employed for tunnel timbering it shall be removed before any concrete is placed, and any spaces outside the neat lines of the concrete structure caused by such removal shall be filled with concrete as above provided. In the event that it is found impracticable, in the opinion of the District Engineer, to remove timbering or portions thereof, such timbering may be allowed to remain permanently in place, but in no case shall such timber so remaining be allowed to project into the neat lines of the concrete structure. Where timber is permitted to remain, all spaces outside of the neat lines of the concrete structure shall be filled with concrete mixed in the same proportions and placed at the same time as the concrete in the neat structure. If structural steel shapes are used for tunnel sets they may be allowed to remain permanently in place provided that they do not project into the concrete more than four inches (4") beyond said neat lines of the concrete structure.

Any excavation which, due to requirements of timbering or the nature of the material, or caused by over-breakage, extends more than one foot (1′) from the outside neat lines of the concrete structure, may, at the option of the Contractor, in lieu of replacing with the Structural Concrete specified, be filled to within one foot (1′) of said neat lines of concrete with spalls, boulders, or other material approved by the District Engineer and grouted in with a cement grout consisting of one (1) part of cement to three (3) parts of fine aggregate, and applied as directed by the District Engineer and to his satisfaction. Such construction, however, shall not be permitted within the one foot (1′) space outside of the neat lines of the concrete structure, and such space shall be filled only with Portland Cement Concrete mixed in the same proportion and placed at the same time as the structural concrete, provided that if steel liner plates and ribs are used and are allowed by the District Engineer to remain in place, the [152] spaces back of plates and ribs shall be dry packed and grouted as provided, but any space between the plates and the neat lines of the structure shall be filled with concrete at the same time as the neat structure.

Wherever reference is made to 'neat lines of the concrete structure' it is hereby specified that the neat lines so referred to are the outside lines of the structural concrete lining, as shown on the plans."

Section 32, subparagraph 5(e):

"Timbering.—The term 'Timbering' as used herein shall include all wooden pieces or structures used to support the earth or rock adjacent to any excavation. The Contractor shall furnish, put in place, construct and maintain all timbering necessary to support the sides and top of the excavations, preliminary to the placing of the concrete lining. The timbering shall be so constructed as to prevent any movement or caving which might in any way injure the proposed structures or endanger any person. Wherever, in the opinion of the District Engineer, sufficient or proper timbering has not been provided, the Contractor shall furnish additional timbering. but neither compliance with the District Engineer's instructions nor failure of the District Engineer to give such instructions shall relieve or release the Contractor from his responsibility for the sufficiency of the timbering.

It is the general intent of these specifications that all timbering shall be removed from the excavation before concrete is placed. Should conditions arise where, in the opinion of the District Engineer, it is impracticable to remove certain timbers or structures, such timbering, upon the written consent of the District Engineer, may be permitted to remain, subject, however, to the provisions herein contained in respect to clearances outside of the concrete lin-

ing. Timbers allowed to remain in place shall in no case project into the neat lines of the concrete structure, and, in the event that it is apparent, during the process of excavation and timbering, that the safety of the excavation will require timbering to remain in place, the Contractor shall enlarge the excavated section to the extent necessary to set the timbers outside of future concrete lines; timbers found to project within the concrete lines shall be removed and reset before concreting. Permission to allow timbers to remain will not be granted for any other reason than to secure the safety of the structure.

Where timber is allowed to remain it shall be keyed or wedged firmly against the adjacent rock or earth, and shall be securely fastened, spiked or bolted so that no movement, shifting or settlement shall occur. All joints shall have full and firm bearing, timber to timber, without shimming or blocking. All timber, whether permanent or temporary, shall be sound Douglas fir and no second-hand material shall be used, provided, however, that material already used in tunnel construction and removed in good condition, may, with the approval of the District [153] Engineer, be reused where conditions permit.

Timbering shall be placed in such a manner as to be readily removed, without endangering the safety of the excavation or causing weak-

ness or excessive stresses in adjacent timber sets or concrete structures, and any damage which may occur shall be remedied by the Contractor at his own expense, including the removal and replacement of any concrete which has, in the judgment of the District Engineer, been damaged or subjected to excessive loads on account of such operations.

Lagging behind timber sets shall be restricted to the least extent consistent with safety, and, if, in any case, permitted by the District Engineer to remain permanently in place, shall be so spaced as to permit the unrestricted flow of concrete through the lagging to fill any spaces between the lagging and the excavated surfaces."

Section 32, subparagraph 5(f):

"Structural Steel Supports.—Structural steel shapes may be used to support the sides and tops of the excavation, either entirely or in connection with timbering. Where structural steel ribs are used the same may be allowed to remain in place, provided that they do not project into the concrete more than four inches (4") beyond the neat lines of the concrete structure. The manner of framing, supporting and removal shall be such as to fully support the excavation while in place, and permit removal without endangering other parts of the structure. All timbering used in connection therewith

shall conform to the requirements set forth under 'Timbering' including the removal before concrete is placed. Where steel is permitted to remain in place, all spaces between the steel and the adjacent earth or rock shall be thoroughly filled with concrete so as to provide firm and uniform bearing and the steel ribs and liners shall be so constructed and erected that no settlement or movement will occur. Liner plates allowed to remain in place shall not project into the neat concrete structure."

Section 32, subparagraph 5(g):

"Types of Tunnel Section.—Two typical tunnel sections are shown on the plans. The District Engineer shall determine which section shall be used in any specific location in order to meet varying conditions which may be encountered. In general, it is expected that the Type 'A' section will be used throughout the major length of the tunnels, but if conditions arise which, in the judgment of the District Engineer, require the use of Type 'B' section, the Contractor shall make such modifications in construction as may be necessary.

No extra payment will be allowed on account of such change, but the unit prices bid for the various units or [154] types of work shall include full compensation for such work, labor, material or equipment as may be necessary."

(26) The amendment and supplement to final specifications for the construction of said project,

adopted January 9, 1934, reads in so far as material herein in part as follows:

"The attention of all bidders is hereby specifically called to Bulletin No. 2 of Federal Emergency Administration of Public Works entitled 'General Information and Instructions for the Guidance of State Advisory Boards and State Engineers (P. W. A.).' A grant of thirty (30) per cent of the cost of labor and material used in the project of the District has been made by the Public Works Administration of the United States under the terms of said National Industrial Recovery Act, and all bidders are hereby advised that the Directors of the District will cooperate with the Public Works Administration and all its officers and employees in the enforcement of all of the provisions of said National Industrial Recovery Act and the rules and regulations heretofore and hereafter promulgated applicable to the performance of the work on the project of the District.

Bidders are advised to secure complete information as to the rules and regulations of the Public Works Administration applicable to the work to be performed to complete the project of the District, to the latest date available at the time the respective proposals of the bidders are submitted to the District."

XIII

Finds that subsequent to the first day of June, 1936, the District Engineer of defendant estimated

and certified the amount of work done by plaintiff under the terms of said contract for the month of May, 1936, and the sum due the plaintiff on or before June 10, 1936 under the terms of said contract, which sum was $152,086.98 (less $3,500 stipulated damages for delay as hereinafter found), and defendant on June 10, 1936 did transmit to plaintiff the sum of $148,586.98, the amount of said estimate less the sum of $3,500, the said retained payment of $3,500 being the sum of $500 a day for seven working days retained by defendant as agreed and liquidated damages because the said contract had not been completed within seven hundred and twenty calendar days from the time of entering into the same. The plaintiff herein did on [155] said 13th day of June, 1936 return the amount so paid to plaintiff by defendant, with its said purported notice of rescission.

At no time before said attempted rescission, nor at any time thereafter, did the plaintiff demand of defendant the payment of said sum of $3,500 or any part thereof or protest against the withholding of the same or any part thereof, nor make upon the defendant any demand whatever therefor or for any part thereof, but quit and abandoned said work and refused to proceed further with the same.

At no time after the tender by defendant to plaintiff of said sum of $148,586.98 or after the plaintiff had knowledge that said defendant had deducted the amount of liquidated damages hereinbefore referred to did the said plaintiff request the

District Engineer of defendant to make any determination on said matter or to determine the said or any other question in relation to the said work and materials furnished by the plaintiff or the performance of said contract or to the fulfillment or interpretation of any clause in the specifications, but the said plaintiff on June 13, 1936, did serve and file its said notice attempting to rescind said contract and did entirely cease all work on said project and did refuse to continue to perform any work under said contract, and ever since has and still continues so to refuse, without making any demand whatever upon defendant District to make the said payments so withheld or to have the matter determined by the District Engineer, or to submit any matter in dispute between plaintiff and defendant to said District Engineer.

The total contract price for the performance of said work was and is a sum in excess of $3,500,000. When the said plaintiff abandoned said work the work to be performed under said contract was about seventy per cent complete. [156]

XIV.

Finds:

(1) That defendant withheld said sum of $3500 as agreed and liquidated damages because of the failure of plaintiff to complete said contract within the specified time and under an honest belief that the defendant had the right so to do and was required so to do by the provisions of the agreement between the parties, and finds that defendant at all

times was ready, able and willing to submit the matter to the District Engineer for determination in accordance with the provisions of subdivision (e) of Section 6 of the specifications, as above found.

(2) With reference to the claim of rescission based upon defendant's failure to grant an extension of time, in this connection the court finds that plaintiff asked for such an extension of time for 180 days on the 10th day of June, 1935, which request was refused by defendant on the 12th day of July, 1935; that said plaintiff was requested by the District Engineer to specify and itemize the reasons for its request for an extension of time but no such itemized request was ever submitted. Finds that on the 8th day of May, 1936 plaintiff requested 600 days extension of time to complete said work but did not specify or itemize the reasons for the amount of time it was asking for any specific portion of the work upon which it claimed it was delayed, nor submit any evidence in connection with such request; that such request for 600 days extension of time was denied by the District and written notice thereof delivered to plaintiff on May 14, 1936.

(3) The court finds that said request for an extension of time for 600 days was unreasonable and that the said work could have been completed by plaintiff within 200 days from June 13, 1936; said request was not itemized so the District or the District Engineer could determine how many days

the plaintiff [157] claimed to have been delayed for any of the respective matters set forth in said request. Notwithstanding the denial of said first application on July 12, 1935 plaintiff continued with the work until the 13th day of June, 1936 and did receive and accept from defendant during that period of time and on account of said work under the terms of said contract sums in excess of $1,000,000.00, and notwithstanding the fact that on the 14th day of May, 1936 plaintiff knew that its extension of time for 600 days was denied plaintiff continued with the work until the 13th day of June, 1936.

(4) At no time did plaintiff comply with the request of the District Engineer for any itemization of its various claims for delay, nor did plaintiff present a new and further application for extension of time for any lesser number of days than 600, with specific itemization as to its reasons for various delays and the number of days it claimed to be delayed for any specific cause. The District in denying said extension of time acted in good faith and not arbitrarily or capriciously.

(5) The court finds that the said Contractor was not delayed in said work by any act of God, or by stormy or inclement weather, or by any reason which in the judgment of the District Engineer unavoidably delayed the work, but on the contrary the court finds that the work of the Contractor was not unavoidably delayed and that any delays that occurred were because of the method of work

adopted by the Contractor, and that in passing upon all such questions the District and its Engineer acted fairly and honestly.

(6) With reference to the claimed right of rescission by plaintiff because of the claim of plaintiff that there was a difference in underground conditions as such claim is stated in said notice of June 13, 1936, the court finds that the underground conditions were known and ascertained by plaintiff prior to the [158] 1st day of January, 1935; that in addition plaintiff by its contract took the risk of completing the work and of any underground conditions encountered; that it was the obligation of plaintiff under the contract to perform the work and overcome any conditions that might be encountered in the performance thereof, and that notwithstanding plaintiff's claim that such conditions were misrepresented plaintiff continued to perform the contract after full knowledge of all conditions for more than eighteen months before it abandoned the contract and during such period did accept from defendant sums in excess of $1,500,000.00 as compensation for said work; and the court finds that with full knowledge of said conditions from almost the inception of the contract plaintiff continued with said work for more than one year after entering into said contract without making any complaint that underground conditions were different than those plaintiff claims to have anticipated. Finds that defendant at no time made any misrepresentations to plaintiff.

(7) The court finds that as early as the 26th day of December, 1934, plaintiff made a claim on defendant that defendant was not furnishing points, lines and grades, and other engineering work which plaintiff claimed defendant should furnish it under the contract. In this connection the court finds that the defendant furnished plaintiff all the engineering work required to be furnished under the agreement, and further finds that as early as the 22nd day of January, 1935 defendant communicated in writing its position to plaintiff and informed plaintiff that defendant would not furnish the additional engineering demanded by plaintiff; that notwithstanding plaintiff's knowledge of the position taken by defendant with reference to this claim plaintiff continued to work under said contract until the 13th day of June, 1936, and from the time of first making said claim until cessation of work [159] plaintiff received from defendant sums in excess of $1,400,000.00 in connection with work under said contract.

(8) The court further finds that as to all matters stated in said notice of rescission, at no time did plaintiff request that these or any of them be submitted to the District Engineer of defendant in order that said District Engineer might determine any or all questions in relation to said work or materials or the performance of said contract, or any or all questions which had arisen relative to the fulfillment or interpretation of specifications on the part of plaintiff, which specifications at all

times were and are now a part of said contract. The court finds that said District Engineer was never so requested by plaintiff in writing or otherwise, nor was any demand in writing or otherwise ever made by plaintiff upon defendant to have these matters in dispute submitted to said District Engineer for decision.

(9) The court finds that by the foregoing plaintiff has waived any right, if it ever had any such, to rescind such contract because of the said matters in this paragraph XIV specified and found or as mentioned in said purported notice of rescission, or any of them, and that any right of plaintiff to rescind, if it ever had any such, was and is waived by acquiescence, laches and delay; and the court further finds that in finding any right was waived by acquiescence, laches and delay the court does not intend to and does not find that plaintiff had any right to rescind; on the contrary the court specifically finds that said rescission was without justification or right upon the part of plaintiff, and the quitting of said work and refusing to proceed by plaintiff was an abandonment of the contract and a breach thereof. [160]

XV

Finds that at no time from the time of the entering into of said contract by plaintiff until the abandonment of the said work and contract on the 13th day of June, 1936 did plaintiff before commencing any work which plaintiff claimed was not properly

a part of the work under said contract, notify the District Engineer in writing of plaintiff's objection to the same and refusal to perform such work until notified in writing by said Engineer of his decision in the matter, but on the contrary the said plaintiff without such written objection and without any written decision by said Engineer did continue with said work and did perform all work under said contract until the 13th day of June, 1936, when the same was abandoned by plaintiff as aforesaid.

XVI.

Finds that subsequent to its organization the defendant District caused final surveys, plans, specifications and detailed drawings to be prepared for said project and did include therewith the final estimate of the cost of said project, and the same were approved by the board of supervisors of each of the counties within said District, namely, the Board of Supervisors of the County of Alameda and the Board of Supervisors of the County of Contra Costa, State of California, and by the Director of the Department of Public Works of the State of California, and a certified copy of said final surveys, plans, specifications and detailed drawings and of said estimated cost was transmitted to the Director of said Department of Public Works of the State of California.

XVII.

Finds that after the approval of said final plans and specifications, as aforesaid, the defendant did

cause a notice inviting sealed proposals and bids for the construction of its said project to be published twice in a newspaper of general cir- [161] culation published and circulated within the District, namely, in "The Oakland Tribune," which newspaper was designated for such purpose by the Board of Directors of said District, the first publication of which notice inviting said bids was printed and published on May 7th, 1934 and not less than ten days prior to the time fixed for receiving such bids. Pursuant to said notice bids for the construction and completion of said project were received and opened on the 22nd day of May, 1934, and the bid of plaintiff for the sum of approximately $3,683,931.00 for the construction and completion of said project and the performance of all work in connection therewith was accepted by defendant and the contract awarded to plaintiff as the lowest responsible bidder; that plaintiff was in fact the lowest responsible bidder for said work.

XVIII.

Finds that thereafter and on the 4th day of June, 1934, pursuant to said call for bids and the bid of plaintiff and the award made to plaintiff by defendant, a contract in writing was entered into between plaintiff and defendant wherein and whereby plaintiff agreed with defendant that plaintiff pursuant to the terms of said contract and for and on behalf of defendant would construct, erect and complete the said project of defendant and do and

perform all work in connection therewith, all as described in said contract and all in accordance with the final surveys, plans, specifications and detailed drawings therefor theretofore adopted by the Board of Directors of said Joint Highway District No. 13, and which said contract, plans and specifications at all times herein mentioned have been on file in the office of the defendant District.

XIX.

Finds that the said contract so let pursuant to the said bid of plaintiff included all work which was to be done in [162] connection with said project, and no other contract with plaintiff was ever let therefor nor for any part thereof, and until said work was abandoned by plaintiff no other call for bids was ever made by defendant and no other final surveys, plans, specifications, detailed drawings or estimates for said work have been made.

XX.

Finds that pursuant to said contract of June 4, 1934, defendant from time to time has paid plaintiff the monthly progress payments provided for in said contract and continued to make such payments up and until the 13th day of June, 1936, on which date plaintiff abandoned said contract and work and refused and thereafter continued to refuse to perform said work or to complete the said project or any part thereof.

XXI.

Finds that said plaintiff has not been requested by defendant to perform any work except the work specified in said contract, and plaintiff has performed no other work for defendant and has made no bid for any other work. The said contract of June 4, 1934 is the sole and only contract and the sole and only understanding between the plaintiff and defendant for the performance of the work specified in said contract.

XXII.

Finds that said final surveys, plans, specifications and detailed drawings so prepared by said defendant District did include a final estimate of cost, which estimate did not exceed the estimate named in the preliminary report of the District Engineer for said project. The bid of plaintiff was within the said final estimate. The purported claim of plaintiff sued upon herein exceeds its said bid and the said final estimate by a sum greatly in excess of ten per cent of said final estimate. There [163] has been no approval by the Board of Supervisors of any County comprising said District or of the Director of the Department of Public Works of the State of California of the said increase in costs sought to be recovered by plaintiff herein. The State of California has contributed a part of the cost of said project, namely, the sum of $700,000.00.

XXIII.

Finds that each of the cross-defendants hereinafter mentioned, at all the dates and times herein mentioned and at the time of the filing of said cross-complaint, was and is now a corporation duly incorporated, organized and existing under and by virtue of the laws of one of the several States of the Union as hereinafter in this paragraph respectively designated for each of said respective cross-defendants:

(a) Hartford Accident and Indemnity Company, a Connecticut corporation;

(b) Fidelity and Deposit Company of Maryland, a Maryland corporation;

(c) The Aetna Casualty and Surety Company, a Connecticut corporation;

(d) Indemnity Insurance Company of North America, a Pennsylvania corporation;

(e) American Surety Company of New York, a New York Corporation;

(f) Maryland Casualty Company, a Maryland corporation;

(g) United States Fidelity and Guaranty Company, a Maryland corporation;

(h) The Fidelity and Casualty Company of New York, a New York corporation;

(i) Glens Falls Indemnity Company, a New York corporation;

(j) Standard Surety and Casualty Company of New York, a New York corporation; [164]

(k) Standard Accident Insurance Company, a Michigan corporation;

(l) Massachusetts Bonding and Insurance Company, a Massachusetts corporation;

(m) Continental Casualty Company, an Indiana corporation.

(n) New Amsterdam Casualty Company, a New York corporation.

XXIV.

Finds that at all the dates and times herein mentioned and at the time of the filing of said cross-complaint the said cross-complainant was and is now a citizen of the State of California, and the respective cross-defendants and each of them in the preceding paragraph mentioned, and the plaintiff and cross-defendant were at all the dates and times herein mentioned and are now citizens of States other than the State of California.

XXV.

Finds that the proceeding on said cross-complaint is one of a civil nature, and the parties to said cross-complaint were at all the dates and times herein mentioned and still are citizens of different States; that the sum involved in said cross-complaint, exclusive of costs and interest, is in excess of the sum of $3,000.00, the claim of defendant in the prayer of its cross-complaint being for the sum of $383,568.16.

XXVI.

Finds that on the 4th day of June, 1934, the contract in writing mentioned in paragraph VII hereof was duly and regularly entered into between Six Companies of California, a Nevada corporation, plaintiff herein, and defendant herein, and delivered upon said date by plaintiff to defendant, for the performance of the work hereinbefore mentioned and as hereinbefore found. [165]

XXVII.

Finds that plaintiff as said Contractor did also deliver as part of said contract a certain bond conditioned upon the faithful performance of said contract by plaintiff, which bond was executed by plaintiff and by each of the other cross-defendants. Said bond expressly referred to said contract as that annexed thereto and was made a part of such contract. Such bond above referred to, so made, executed and delivered by plaintiff and by each and every of the other cross-defendants to the defendant and cross-complainant is attached to the cross-complaint of said cross-complainant and marked Exhibit "A". [166]

XXVIII.

Finds that plaintiff proceeded with the work specified to be done in said contract between plaintiff and defendant and continued with said work up to and including the 13th day of June, 1936, upon which date the plaintiff abandoned the said contract and the said work and then and there

refused and ever since has refused to continue with the same or to further perform said agreement or any part thereof.

XXIX.

Finds that upon the abandonment of said work defendant in writing notified plaintiff and cross-defendant and each of the other cross-defendants that it considered the action of plaintiff in refusing to perform said contract an abandonment thereof, and said defendant and cross-complainant caused notice to be served upon plaintiff and cross-defendant and upon each and every of the other cross-defendants to resume work within three days after the receipt of said notice or the said defendant would construe said acts of the plaintiff as a final abandonment of said contract; a copy of which said notice so delivered to the plaintiff and cross-defendant and to all of the other cross-defendants herein is hereinbefore set forth in paragraph X of these Findings, to which reference is hereby expressly made.

XXX.

Finds that notwithstanding the receipt of said notice by said plaintiff and cross-defendant and by each of the other cross-defendants the said plaintiff and cross-defendant, and each of the other cross-defendants, then and there refused and ever since have refused to continue with the said work or to further perform said contract or any part thereof or any of the work thereunder.

XXXI.

Finds that upon the abandonment of said contract by [167] plaintiff it became necessary for defendant (a) to protect and maintain said work in the unfinished state in which it had been left upon the abandonment of said contract; (b) to measure said work in order to call for bids for the completion of the same and to prepare and secure approval of supplemental specifications by the Department of Public Works of the State of California and the Public Works Emergency Administration of the United States for the completion of the work; (c) to readvertise for bids for such completion; and (d) to secure insurance protecting the defendant against loss by fire and against certain other hazards hereinafter mentioned.

In connection with the maintenance and protection of said work it was necessary for defendant to employ engineers, watchmen and laborers, and to secure materials, supplies and equipment. The reasonable cost of all such protection and maintenance at all times herein mentioned was and is the sum of $47,944.33.

At all times herein mentioned the reasonable cost of measuring said work and of completing said specifications was and is the sum of $5,134.22.

In order to secure bids for new contracts to complete the work it was necessary to readvertise for such purpose, and at all times herein mentioned the reasonable cost of such advertising was and is the sum of $1,862.45.

Upon such abandonment by plaintiff the defendant did secure fire insurance protecting the defendant against the hazard of fire to its property and equipment in said project, and did also secure Workmen's Compensation and Liability Insurance protecting the defendant against claims for injury to any of its employees and for damage or injury to others by reason of the operations of the defendant in maintaining and protecting said work; [168] the reasonable cost of all of said insurance at all times herein mentioned was and is the sum of $14,060.85.

Said sums in this paragraph mentioned in the aggregate amount to $69,001.85, and at all times herein mentioned were and are reasonable.

XXXII.

Finds that said contract provided for progress payments to be made each month by defendant to plaintiff for work done during the preceding month and said contract also provided for the retention by defendant of a sum which in the aggregate should not exceed ten per cent of the contract price, said retained sum to be paid to plaintiff thirty-five days after the completion of the contract by plaintiff. Prior to said default of plaintiff, defendant had paid to plaintiff the sum of $2,021,047.11, which sum represented ninety per cent of the contract price for work done by plaintiff for defendant prior to May 1, 1936 and the defendant retained from said progress payments the sum of $224,560.79, or ten per cent of the contract price, for work done prior

to May 1, 1936. Plaintiff refused to accept the sums tendered by defendant for work performed by plaintiff after May 1, 1936, and defendant has in its possession the sum of $265,891.82 for all work performed by plaintiff after May 1, 1936, as per estimate, and also the said sum of $224,560.79 the said retained percentage above referred to, also a credit for plaintiff of $2,806.55 for partly performed work, said sums aggregating $493,259.16, less liquidated damages of $10,000 retained by defendant, the net amount being $483,259.16.

The reasonable cost of completing the work agreed to be done by plaintiff which remained uncompleted when the plaintiff abandoned the same was and is the sum of $1,751,611.74. Said sum exceeds the sum specified in said contract of June 4, 1934, to be paid by defendant to plaintiff for such work by the sum of [169] $591,325.47. The difference between this last mentioned amount and the sum of $493,259.16 (the aggregate amount still retained by defendant for work done by plaintiff prior to the abandonment of the contract, without any deduction for liquidated damages) is the sum of $98,066.31, which last mentioned sum is the reasonable increased cost of completing the work over the contract price because of plaintiff's default, less credit to plaintiff for any sums heretofore earned by plaintiff.

XXXIII.

Finds that under the provisions of said contract of June 4, 1934, the time when plaintiff was to com-

plete all of the work expired on the 24th day of May, 1936, and when said work was abandoned by plaintiff on June 13, 1936 plaintiff was in default in the completion of said work for a period of twenty days.

Upon the abandonment of said work by plaintiff it became necessary for defendant to measure said work in order that it could call for bids to complete the same, to prepare and secure approval of supplemental specifications by the Department of Public Works of the State of California and the Public Works Emergency Administration of the United States for the completion of the work, and to readvertise for bids for such completion and to enter into contracts therefor. The time required for all of said purposes was one hundred and forty-nine days and the said period of time was and is a reasonable time therefor, and said defendant did proceed with all reasonable dispatch and due diligence so to do.

The first new contract for the completion of the work was entered into on the 9th day of November, 1936, and the reasonable time for the completion of all said work was and is a period of two hundred and sixty-four days from and after said last mentioned date.

The periods of delay in the completing of said work [170] caused by the default of said plaintiff are as follows: A period of twenty days from May 24, 1936, when said time for completion expired, to June 13, 1936 when plaintiff abandoned said

contract; a period of one hundred and forty-nine days, the reasonable time to measure the said work remaining to be done after plaintiff's default in order to call for bids for the completion of the contract and to secure approval of supplemental specifications by the Department of Public Works of the State of California and the Public Works Emergency Administration of the United States, and to readvertise for bids for the completion of said work and to enter into the first new contract therefor; a period of two hundred and sixty-four days, the reasonable time for the completion of all said work after the entering into of said new contract. All said periods of time were and are reasonable and amount in the aggregate to four hundred and thirty-three (433) days delay in the completion of said work, all caused by the action and default of plaintiff.

XXXIV.

Finds that it is provided in said contract of June 4, 1934, that the said contractor, plaintiff herein, shall pay to the defendant as agreed and liquidated damages $500 for each and every working day which may elapse between the limiting date provided in said contract and the date of the actual completion of the work, and that said sum is specifically agreed upon between the parties as a measure of damage to the defendant by reason of delay in the completion of the work, it being expressly understood and agreed that it would be impracticable to estimate and ascertain the actual

damage sustained by the defendant District because of such delay.

XXXV.

Finds that it is and at all times herein mentioned was extremely difficult to estimate the damage which would be sus- [171] tained by defendant because of any delay in the completion of the project of defendant District. The work to be done by said plaintiff for the defendant consisted of the construction of a highway tunnel and approaches and appurtenances, a portion of one of the main highways in Alameda and Contra Costa Counties; said highway connects with and is a part of the State system of highways at either extremity of said work. Said route is a main artery of travel from the San Joaquin Valley to the congested East Bay area in Alameda and Contra Costa Counties and also leading across the new bridge from the City of Oakland to the City and County of San Francisco. From a large area of the state *is it* a more practical, direct and safer route than any highway now in existence connecting the points above mentioned and is greatly needed by the traveling public.

Defendant's project provides a modern highway of low gradients between Walnut Creek, Contra Costa County, and the business center of Oakland, approximately one and one-half miles shorter than the Claremont Road and approximately two and one-half miles shorter than the Tunnel Road, the previous highways, each of which is a narrow high-

way of steep gradients and sharp curves and which carried a combined traffic in excess of 1,600,000 vehicles per year, all of which traffic can be more safely and economically transported over the new route. The resulting loss, inconvenience and damage caused by the delay in opening the project to use as a public highway is exceedingly great and is and was impracticable of exact ascertainment but exceeds $500 per day.

In this connection the court further finds that because of plaintiff's abandonment and the necessary delay required for the letting of new contracts, and because of the delay in completing said work, defendant has been and was required until the work was completed to maintain a large staff of engineers and other [172] employees and keep an active District organization intact, all at a reasonable cost to said District of approximately $272.89 a day, which cost was entirely eliminated upon the completion of said project, which expense to defendant resulted solely from the delay caused by plaintiff's default in the performance of said contract. Said cost and expense in this paragraph alleged is and was in addition to any claim for damage specified in paragraphs XXXI and XXXII of these Findings.

Defendant has financed the cost of said project by the issuance of bonds upon which defendant paid interest, and defendant paid in interest for the said period of four hundred and thirty-three (433) days delay caused by the default of said plaintiff,

without having the enjoyment of said project, a sum in excess of $89,832.67.

For the reasons above stated and because of the difficulty in ascertaining the actual damage the parties agreed upon liquidated damages as aforesaid.

XXXVI.

Finds that the aggregate damages above referred to are as follows: the sum of $69,001.85, the reasonable cost of protecting and measuring the work and of the other matters hereinbefore in paragraph XXXI hereof alleged; the sum of $98,066.31, the increased reasonable cost for completing the contract abandoned by plaintiff in excess of all credits due plaintiff for work heretofore performed by plaintiff for defendant under said contract, as hereinbefore in paragraph XXXII hereof alleged, and the sum of $142,000.00 as agreed and liquidated damages; said sums amount in the aggregate to $309,068.16 and no part thereof has been paid.

Finds that defendant is not entitled to any liquidated damages for the period of 149 days between June 13, 1936, when plaintiff ceased work on said project of defendant and the letting of new contracts by defendant to complete said work. That the [173] aggregate number of days for which defendant is entitled to liquidated damages at the rate of $500 a day is 284 days, amounting to $142,000.00.

XXXVII.

The court finds that at the time of the filing of said cross-complaint the exact expense of comple-

tion of said contract had not been determined. Finds, however, in this connection it is not a fact that upon the filing of said cross-complaint the said defendant and cross-complainant did not have a cause of action against the cross-defendants but on the contrary finds that it did have such cause of action and that the filing of said cross-complaint was not premature.

XXXVIII.

Finds that the said defendant did proceed to complete the work after the abandonment of said contract by plaintiff in the manner provided in said contract and did not breach the said contract in any way, and that the said cross-defendant Surety Companies are not relieved from liability to defendant under said bond.

Finds that said defendant upon the abandonment of said contract did proceed to call for bids for the completion of said work and let all of said work to the lowest responsible bidders upon contracts regularly called and executed, after due notice for bids.

Finds that the cost of completing said work by said defendant and the amounts expended therefor were and each of them is reasonable.

Finds that none of said cross-defendants is relieved of liability to defendant because of the manner in which defendant completed the work. Finds that no change was made in said work but that the same after the abandonment by plaintiff was com-

pleted by defendant under the exact provisions of the plans and specifications of the contract between plaintiff and defendant. [174]

XXXIX.

Finds that there were no representations by defendant to bidders except such as were contained in the notice to bidders, the proposed contract, and the plans and specifications.

Finds it is not a fact that plaintiff was induced to bid and did bid solely upon the representations contained in the plans, specifications and geological report to which attention of bidders was invited. Finds that plaintiff did not rely upon any representations contained in any geological report in making its bid and that no representations were made by defendant through or by means of any geological report.

Finds it is not a fact that said bid of plaintiff would not have been made except for the representations contained in the plans, specifications and geological report, and in this connection the court finds that said bid would have been and was made without regard to any of the matters and things stated in any geological report.

XL.

Finds it is not a fact that either by the plans or the specifications or any geological report was it represented by defendant to plaintiff that the tunnels to be constructed would be driven through

ground which was self-supporting in character for ninety per cent or more, or for any per cent of the total length of said tunnels; or that the same would be required to be constructed or would be constructed with the use only of temporary timber supports for the excavation of said tunnels, which would be removed before the installation therein of the concrete lining or permanent structure thereof.

Finds that no representations made by defendant to plaintiff were false in any particular. [175]

XLI.

Finds it is not a fact that plaintiff performed any work for defendant in the belief that any representations of defendant other than those contained in the notice to bidders, contract, plans and specifications were true and correct. that except as contained in said documents there were no representations by defendant to plaintiff.

XLII.

Finds that all moneys expended by plaintiff in the performance of said work were expended for the performance of work required to be done under said contract, and that no extra expenditures were made by plaintiff by reason of any false representations of the defendant.

XLIII.

Finds that the contract entered into between plaintiff and defendant required that the tunnels should be constructed at the location designated in the

plans and specifications regardless of the type or character of the ground, and that plaintiff was obligated under its contract to so construct said tunnels and is not entitled to recover from defendant any compensation therefor except as provided in said agreement between the parties and as already paid by defendant to plaintiff.

XLIV.

Finds that there was no misrepresentation of underground conditions by defendant to plaintiff, and finds it is not a fact that the work required to be done by plaintiff in constructing the tunnels was different from that required by the contract, and the court finds in this connection that plaintiff wrongfully and improperly abandoned said work and agreement and has not performed since said abandonment any work under said contract. [176]

XLV.

Finds that it is not a fact that there was any understanding between plaintiff and defendant or contemplation as to underground conditions, nor were there any representations by defendant as to such.

Finds that the contract was not entered into in the contemplation of both parties, or of either of the parties, that the ground would be self-supporting in said tunnels for ninety per cent or for any length thereof, but finds in this connection that plaintiff as contractor took all risk with reference to said

work and that there was no mistake by either party to said contract as to the true conditions, and finds it is not a fact that by reason of any mistake plaintiff was relieved of any obligation to perform the work under said contract or entitled to rescind same, nor did plaintiff so rescind, but on the contrary the court finds the plaintiff without cause or right quit the work and abandoned the contract.

XLVI.

Finds it is not a fact that plaintiff was ignorant of or mistaken as to the ground conditions to be encountered in the construction of the tunnels at the time it entered into said contract, or that the defendant had knowledge of facts and circumstances from which it knew or should have known or suspected at said time the nature of the ground or the self-supporting character thereof for ninety per cent or any part thereof.

Finds that there was no fraud upon the part of the defendant and that defendant made no misrepresentations as to underground conditions, nor did it in any way fail or neglect to inform plaintiff of any facts within its knowledge. On the contrary the court finds that plaintiff represented to defendant that it was skilled in the trade or calling necessary to complete the work [177] and entered into the contract with full knowledge that defendant not being so skilled relied upon the skill of plaintiff to do and perform the work in a skillful manner and plaintiff guaranteed the work; that said plaintiff so

represented that it was so skilled and did so guarantee the work to defendant; that there were no false or fraudulent representations of any kind made by defendant to plaintiff; that plaintiff had all means of knowledge as to underground conditions that were available to defendant and assumed all risk under said agreement, and expressly agreed to do and perform the work required to be done under the contract for defendant and to overcome any difficulties which might be required in the performance thereof for the compensation specified in said contract.

XLVII.

Finds it is not a fact that by reason of any ground conditions encountered in the construction of the tunnel the doing or performance or construction of the work specified in the contract, plans and specifications ever became or was in fact impossible of performance. Finds that all work was done under conditions which the parties assumed to exist or had a right to assume to exist by reason of the statements of the contract, plans and specifications; finds that the work done was not radically or otherwise different in character to the work required to be performed by plaintiff under the contract, nor was there any different work required as the result of ground conditions or otherwise; finds plaintiff was not called upon to do any work nor did plaintiff do any work of such character different to that contemplated that either in truth or in fact no contract ever existed for the work done by the plaintiff, but

on the contrary the court finds that any work done by plaintiff was entirely within that contemplated by the contract. [178]

XLVIII.

Finds it is not a fact that the failure of the District Engineer to give to plaintiff points, lines and grades was and is a breach of said contract or entitled said plaintiff to rescind said agreement, and in this connection the court finds that said defendant District did furnish to the plaintiff all the engineering data which it was required to do under the agreement. The court also refers to and incorporates as part of this finding the language of subparagraph (7) of Finding XIV hereof.

XLIX.

(1) Finds plaintiff requested defendant and the District Engineer for extensions of time to complete the work, which extensions of time were denied by defendant; finds that defendant in denying said requests did not act arbitrarily or capriciously, nor was any action of the District Engineer in connection with requests for extensions of time arbitrary or capricious or otherwise than in the exercise of his honest judgment.

(2) Finds that the plaintiff was not unavoidably delayed in the performance of said work for any time or for any reason at all.

(3) Finds that any delays which occurred in the performance of said work were caused by the acts of the plaintiff over which it had control.

(4) Finds that neither the District Engineer nor the defendant knew of any causes which unavoidably delayed the plaintiff in the performance of its work under the contract.

(5) Finds it is not a fact that when any requests for an extension of time were made by plaintiff that either the defendant or the District's Engineer failed to grant or refused to grant plaintiff a hearing thereon or to afford plaintiff the opportunity of properly or otherwise presenting the same, but on the [179] contrary finds that plaintiff never requested any such hearing and never submitted the said matter to said Engineer for decision. That at all times the said Engineer fairly and honestly gave plaintiff full opportunity to present any matter to him for decision, and at no time did said Engineer or said defendant act arbitrarily or capriciously or fraudently and at no time did either the defendant or its said Engineer know that plaintiff was entitled to an extension of time or deny the same for any arbitrary or capricious or fraudulent reason or for any other reason except their sincere, fair and honest belief that plaintiff was not so entitled.

(6) Finds it is not a fact that said Engineer failed in any way in his duty to plaintiff or to consider whether plaintiff was entitled to an extension of time or failed to exercise his judgment as to whether the work was unavoidably delayed or failed to perform any of his duties or obligations under said contract, but on the contrary the court finds the Engineer fulfilled all of his duties and obliga-

tions under the contract, especially any toward plaintiff, and that his action was with full knowledge of the facts and his discretion was fairly and honestly exercised.

(7) Finds it is not a fact that the District Engineer did not act upon any of said requests of plaintiff for an extension of time or that the same were denied by defendant without reference to the opinion or judgment of said Engineer.

(8) Finds that the said Engineer did on or about the 1st day of June, 1936 estimate the work performed by plaintiff during the preceding month at the contract price at the sum of $152,086.98, and that there was tendered to plaintiff the sum of $148,586.98 and no more, the difference in said sum being the retained liquidated damages of $500 a day for seven days amounting to $3500. Previous estimates of the Engineer stated the total [180] value of the work done by plaintiff since the commencement of the contract exceeded the sum of $2,000,000.00. In this connection the court finds that said plaintiff did work on said project each and every day for the seven days for which the said penalty was retained from and after May 24, 1936. Finds further that said plaintiff never made any demand for the payment of said amount withheld but quit and abandoned the contract without submitting the matter in dispute to the Engineer for decision. Finds that by the withhold of said payment said defendant did not breach the agreement but was acting under and honestly attempting to act under

the said agreement and in accordance with its rights thereunder. Finds no further sum was tendered plaintiff by defendant on account of said progress payment due and payable on June 10, 1936.

(9) Finds it is not a fact that defendant intended to and would have withheld not less than $120,000 from the plaintiff at the rate of $500 a day until the completion of the contract, but on the contrary finds that by the abandonment of the contract said plaintiff did not give said defendant any opportunity to adjust the dispute between the parties.

(10) Finds it is not a fact that said defendant in any way breached its said contract with plaintiff in any substantial or material respect or otherwise or at all.

(11) Finds it is not a fact that the consideration for plaintiff's obligation under the contract failed in part or at all because defendant withheld the said sum of $3500, and finds the withhold of said sum did not justify plaintiff in abandoning the contract.

(12) Finds the failure of defendant to grant an extension of time under the circumstances and the withhold of said sum of $3500 was strictly in accordance with defendant's rights under the agreement, and did not justify the abandonment of said agree- [181] ment without notice and without an opportunity to adjust the dispute, or to justify said abandonment of said agreement at all, and the

consideration of said contract did not fail because of said acts in any respect at all.

L.

Finds it is not a fact that plaintiff was ignorant of ground conditions to be encountered in the construction of the tunnels at the time it entered into said contract; or that plaintiff could not have determined or ascertained the true conditions of the ground to be encountered prior to the submission of its bid or prior to the execution of the contract between plaintiff and defendant.

Finds that plaintiff was not forced to and did not in fact rely upon representations obtained from the specifications and geological report, or either of them; finds plaintiff was not misled thereby; finds that plaintiff was not mistaken as to the true condition of the ground.

Finds it is not a fact that defendant had knowledge of facts and circumstances from which defendant knew or should have known or could have known or suspected at any time that the ground conditions through which the tunnels would be driven would not be self-supporting either for ninety per cent of the length of said tunnels or for any part thereof.

Finds that defendant did not falsely or fraudulently fail or neglect to inform and acquaint plaintiff with any facts or circumstances with reference to such ground conditions.

Finds it is not a fact that plaintiff entered into the contract with defendant solely or otherwise by reason of the mistaken belief of plaintiff as to ground conditions or by reason of any fraud of defendant.

Finds it is not a fact that plaintiff for any reason [182] was relieved of any obligation to perform said contract or was entitled to rescind the same, but on the contrary finds that there were no misrepresentations of any conditions by defendant to plaintiff and that plaintiff was not entitled to rescind the said contract but its action in refusing to perform the same was a breach thereof. [183]

And from the foregoing findings of fact the Court makes the following

CONCLUSIONS OF LAW

1. That plaintiff take nothing by its said complaint on file herein or by either count thereof.

2. That defendant and cross-complainant Joint Highway District No. 13 of the State of California, a public corporation, is entitled to judgment against plaintiff and cross-defendant Six Companies of California, a corporation, as follows: For the sum of $69,001.85, the reasonable cost of protecting and measuring the work as hereinbefore found, after the abandonment of said contract by plaintiff; for the further sum of $98,066.31, the increased reasonable cost for completing the work after the abandonment thereof by plaintiff in excess of all credits

due plaintiff for work performed by plaintiff for defendant under said contract; and for the further sum of $142,000.00 as agreed and liquidated damages at the rate of $500 per day for 284 days' delay, consisting of 20 days' delay in performance of said contract after the expiration date of said agreement and before the abandonment of the same by plaintiff, and for an additional 264 days' delay, the reasonable time for the completion of said work after the letting of new contracts by said defendant upon the default of plaintiff; said sums aggregate $309,068.16, to all of which defendant and cross-complainant is entitled to judgment against plaintiff.

3. That defendant and cross-complainant is not entitled to any agreed or liquidated damages for the period of 149 days' delay ensuing between the date of June 13, 1936 when plaintiff ceased work on said project of defendant and the date of the letting of new contracts to complete said work by defendant with other contractors. [184]

4. Said defendant and cross-complainant Joint Highway District No. 13 of the State of California, a public corporation, is entitled to judgment jointly and severally against the said plaintiff and against each of the respective Surety Company cross-defendants hereinafter named in the following percentages of said sum of $309,068.16;

Against plaintiff and the cross-defendant Hartford Accident and Indemnity Company, a Connecti-

cut corporation, in the amount of ten (10) per centum of said sum, to-wit $30,906.81;

Against plaintiff and the cross-defendant Fidelity and Deposit Company of Maryland, a Maryland corporation, in the amount of ten (10) per centum of said sum, to wit $30,906.81;

Against plaintiff and the cross-defendant The Aetna Casualty and Surety Company, a Connecticut corporation, in the amount of ten (10) per centum of said sum, to wit $30,906.81;

Against plaintiff and the cross-defendant Indemnity Insurance Company of North America, a Pennsylvania corporation, in the amount of ten (10) per centum of said sum, to wit $30,906.81;

Against plaintiff and the cross-defendant American Surety Company of New York, a New York corporation, in the amount of ten (10) per centum of said sum, to wit $30,906.81;

Against plaintiff and the cross-defendant Maryland Casualty Company, a Maryland corporation, in the amount of six and one-half (6½) per centum of said sum, to wit $20,089.43;

Against plaintiff and the cross-defendant United States Fidelity and Guaranty Company, a Maryland corporation, in the amount of six and one-half (6½) per centum of said sum, to wit $20,089.43;

Against plaintiff and the cross-defendant The Fidelity and Casualty Company of New York, a New York corporation, in the amount of five (5) per centum of said sum, to wit $15,453.40; [185]

Against plaintiff and the cross-defendant Glens Falls Indemnity Company, a New York corpora-

tion, in the amount of four and one-half (4½) per centum of said sum, to wit $13,908.06;

Against plaintiff and the cross-defendant Standard Surety and Casualty Company of New York, a New York corporation, in the amount of four (4) per centum of said sum, to wit $12,362.72;

Against plaintiff and the cross-defendant Standard Accident and Insurance Company, a Michigan corporation, in the amount of four (4) per centum of said sum, to wit $12,362.72.

Against plaintiff and the cross-defendant Massachusetts Bonding and Insurance Company, a Massachusetts corporation, in the amount of four (4) per centum of said sum, to wit $12,362.72;

Against plaintiff and the cross-defendant Continental Casualty Company, an Indiana corporation, in the amount of two and one-half (2½) per centum of said sum; to wit $7,726.70;

Against plaintiff and the cross-defendant New Amsterdam Casualty Company, a New York corporation, in the amount of two (2) per centum of said sum, to wit $6,181.36.

5. The defendant and cross-complainant is entitled to judgment against plaintiff and each of the cross-defendants hereinabove named for its costs of suit incurred herein.

Let judgment be entered accordingly.

Dated: 22nd September, 1938.

MICHAEL J. ROCHE,
Judge. [186]

Due service and receipt of a copy of the foregoing Proposed Findings and Conclusions of Law as prepared by Defendant is hereby admitted this 12th day of August, 1938.

ORDER

Upon reading and filing the foregoing stipulation, and good cause appearing, it is hereby ordered that the time within which plaintiff and cross-defendants may prepare, lodge with [189] the Clerk and serve upon defendant and cross-complainant their proposed findings of fact and conclusions of law and their proposed amendments and additions to the proposed findings of facts and conclusions of law

served and filed by defendant and cross-complainant herein, be and the same is hereby extended to and including the 31st day of August, 1938.

Dated: August 15th, 1938.

MICHAEL J. ROCHE,
District Judge.

[Endorsed]: Filed Aug. 15, 1938. [190]

[Title of District Court and Cause.]

PLAINTIFF'S AND CROSS-DEFENDANTS' OBJECTIONS AND PROPOSED AMENDMENTS AND ADDITIONS TO THE FINDINGS OF FACT AND CONCLUSIONS OF LAW REQUESTED BY DEFENDANT AND CROSS-COMPLAINANT JOINT HIGHWAY DISTRICT No. 13

Plaintiff and cross-defendants hereby propose the amendments and additions hereinafter set forth to the proposed findings of fact and conclusions of law heretofore served and [193] filed by defendant and cross-complainant Joint Highway District No. 13, in the above entitled action.

Plaintiff and cross-defendants also file herewith their request for findings of fact and conclusions of law which are additional to these objections and proposed amendments and additions to the proposed findings of fact and conclusions of law proposed by defendant, which objections and proposed amendments and additions are as follows:

1.

Strike out all of the said defendant's proposed findings of fact and conclusions of law and substitute in lieu thereof the findings of fact and conclusions of law proposed by plaintiff and cross-defendants and filed herewith.

In the event that the request in paragraph number 1 is not granted, plaintiff and cross-defendants request that the following amendments and additions be made to defendant's proposed findings of fact and conclusions of law:

1.

Strike out lines 1 to 28, inclusive, on page 2 of defendant's proposed findings and substitute lines 1 to 29, inclusive, on page 2 of plaintiff's and cross-defendants' proposed findings.

2.

Strike out all of paragraph V of the proposed findings of fact and substitute in lieu thereof the following:

"Within two years prior to the filing of the complaint in this action defendant became indebted to plaintiff in the sum of $4,499,073.64 for work done, labor performed and materials furnished by plaintiff to defendant at the special instance and request of defendant. Defendant has paid to plaintiff $2,021,047.11 on account of said indebtedness and no more and there is now due, owing and unpaid from defendant to plaintiff [194] on account thereof the

sum of $2,478,026.53, plus interest thereon at the rate of 7% per annum from June 13, 1936 to date of judgment."

3.

Strike out "4th" in paragraph VII, page 4, line 18, and substitute "14th" in lieu thereof.

4.

Insert in paragraph VIII, page 5, line 18, between the word "month" and the word "from", the words "except the months of May and June 1936."

5.

Strike out the words "abandoned said work and" in the third line of paragraph IX on page 5.

Strike out the words "abandonment and attempted" in the fifth line of paragraph IX on page 5.

Insert the words "of said contract" after the word "rescission" in line 1 on page 6.

6.

Strike out the words "and that on said date said defendant wrongfully abandoned the said work and contract between plaintiff and defendant" appearing in the fourth, fifth and sixth lines of paragraph XI and substitute in lieu thereof the following: "and plaintiff was justified in so refusing to proceed."

7.

Insert after the word "contract" in paragraph XII, line 23, page 9, the following: "unless ex-

tended in accordance with the provisions of the contract".

Strike out the word and figures "May 24, 1936" in paragraph XII, subparagraph (1), line 27, page 9, and substitute in lieu thereof the word and figures "June 3, 1936." [195]

8.

Strike out all of paragraph XIII, commencing on page 23, and substitute in lieu thereof plaintiff's and cross-defendants' proposed findings of fact numbers 69 to 73, inclusive.

Add to said paragraph XIII the following:

"When the district engineer of defendant signed said estimate for May, 1936, he made his determination and decision that said amount of $3,500.00 should be deducted from the progress payment due plaintiff for work done in May, 1936, and the delivery of said estimate to plaintiff was notice to it of such determination and decision. Said engineer already having determined and decided the matter, plaintiff was under no duty or obligation, under said contract, or otherwise, to make any further request or demand of said engineer for its determination."

9.

Strike out all of paragraph XIV, commencing on page 25.

In lieu of subparagraph (1) of paragraph XIV substitute the following:

"Defendant withheld said sum of $3,500.00 from the progress payment due plaintiff for work done

in May, 1936, after the determination of the district engineer that it should be withheld. Said determination of said engineer was capricious, arbitrary and wrongful and the action of defendant in making said deduction was a material breach of said contract entitling plaintiff to rescind the same."

In lieu of subparagraphs (2), (3), (4) and (5) of paragraph XIV substitute plaintiff's and cross-defendants' proposed findings of fact numbers 29 to 68, inclusive, filed herewith.

In lieu of subparagraph (6) of paragraph XIV substitute the following:

"With reference to the right of rescission by plaintiff [196] because the ground conditions encountered in driving the tunnels differed from those represented by defendant to plaintiff before said contract was executed, the Court finds that said ground conditions actually encountered did differ materially and radically from those represented by defendant to plaintiff and that because of such difference in ground conditions the cost, difficulty and time required for constructing said tunnels was greatly increased over what it would have been if said ground conditions had been as represented. While plaintiff knew, as early as January 1, 1935, that the ground encountered in driving the first 92 feet of the south tunnel and 110 feet of the north tunnel had been much worse than represented by defendant, it had no knowledge, or means of knowing, that the remainder of the ground through which the tunnels would be driven would be different from

that represented by defendant and plaintiff did not have, and could not have acquired, such knowledge until the ground was actually excavated. In April of 1935, plaintiff complained to said district engineer of said ground conditions and thereafter on several occasions plaintiff complained both orally and in writing to said district engineer and to the Board of Directors of defendant of the difference in said ground conditions."

In lieu of subparagraph (7) of paragraph XIV substitute paragraph number 74 of plaintiff's and cross-defendants' proposed findings of fact filed herewith.

In lieu of subparagraph (8) of paragraph XIV substitute the following:

"On frequent occasions plaintiff discussed with the district engineer of defendant all of the matters set forth in said notice of rescission, excepting said deduction of $3,500.00 from the progress payment due plaintiff for work performed in May, 1936, and said Engineer was at all times thoroughly [197] familiar with them and the controversy between the parties respecting them. The matter of the deduction by defendant of said amount of $3,500.00 from the progress payment due plaintiff for work performed in May, 1936, was submitted to and decided, arbitrarily, capriciously and fraudulently by said engineer against plaintiff when said engineer signed and certified said estimate for the value of the work done during that month. The right of plaintiff to an extension of time was submitted to and decided

arbitrarily, capriciously and fraudulently by said engineer against plaintiff and plaintiff was notified in writing by defendant of the decision of said engineer.

"The obligation of defendant to furnish points to line and grade was not a matter requiring submission to said engineer but was imposed by the plain and unambiguous terms of the contract which could not be changed by any construction by said engineer. Nevertheless, said engineer considered and purported to decide, that defendant did not have such obligation and attempted to change and modify the terms of the contract so as to relieve defendant of such obligation.

"The controversies over misrepresentation by defendant of ground conditions amounting to fraud and over mutual mistake as to ground conditions and mutual mistake of facts in entering into said contract were matters which said engineer had no right, under said contract, or otherwise, to decide and over which he had no jurisdiction and plaintiff had no obligation or duty to submit said matters to said engineer."

In lieu of subparagraph (9) of paragraph XIV substitute the following:

"Plaintiff did not, by laches, delay or otherwise, waive its rights to rescind said contract.

"Immediately on the failure of defendant to make the [198] progress payment due plaintiff for work done in May, 1936, plaintiff, with promptness and due diligence, rescinded said contract.

"The furnishing by plaintiff of lines and grades for the construction of a part of said tunnels did not constitute a waiver by plaintiff of the obligation of defendant to furnish lines and grades for the remaining work to be done in constructing said tunnels, or of plaintiff's right to rescind said contract for the failure and refusal of defendant to perform said obligation and agreement on its part.

"Plaintiff had the right to rescind said contract on all of the grounds stated in its notice of rescission and rescinded the same with promptness and diligence after the right to rescind arose."

10.

Strike out paragraph XV, page 29, and substitute in lieu thereof the following:

"The additional work done by plaintiff in constructing said tunnels over that described in the contract was not of a kind or character which said contract required the district engineer to authorize in writing before plaintiff proceeded therewith. All of the work of constructing said tunnels was so radically different from and so much more costly and difficult to perform than that described in the contract that plaintiff was not obligated to perform the same for the compensation stated in the contract.

"Plaintiff notified said defendant in August, 1935, in writing, of the radically different nature and character of said work, of its objection to performing same and that it would hold defendant re-

sponsible for the additional cost incurred in constructing the tunnels." [199]

11.

Strike out the date "4th" in paragraph XVIII, page 30, line 15, and substitute "14th" in lieu thereof.

12.

Strike out the words "included all work which was to be done in connection with said project, and no other contract with plaintiff was ever let therefor nor for any part thereof" in paragraph XIX, commencing in line 31, page 30, and ending in line 2, page 31, and substitute in lieu thereof the following: "was the only contract in writing let by defendant to plaintiff."

Strike out the words "work was abandoned" in paragraph XIX, page 31, line 3, and substitute "contract was rescinded" in lieu thereof.

13.

Strike out paragraph XX, page 31, and substitute in lieu thereof the following:

"Pursuant to said contract defendant from time to time, until the progress payment became due and payable for work done under said contract in May, 1936, paid plaintiff the monthly progress payments which became due and payable under said contract. On June 10, 1936, defendant delivered to plaintiff a progress payment for work done during May, 1936, from which defendant had wrongfully deducted the

amount of $3,500.00. Plaintiff thereupon rescinded said contract and has not, since June 13, 1936, performed any work thereunder. Said deduction of $3,500.00 from said progress payment was a material breach of said contract by defendant which entitled plaintiff to rescind the same."

14.

Strike out paragraph XXI, page 31, and substitute in lieu thereof the following:

"Upon rescission of said contract by plaintiff, [200] defendant became liable to pay to plaintiff the reasonable value of the work and labor done and materials furnished by plaintiff to defendant while engaged in performing work under said contract plus a reasonable profit equal to 17½% thereof, less the amounts theretofore paid by defendant to plaintiff."

15.

In paragraph XXII, page 31, line 29, strike out the word "purported."

16.

Add after the word "cross-complaint" in paragraph XXV, page 33, line 19, the words "except Fireman's Fund Indemnity Company and Pacific Indemnity Company."

Add after the word "States" in paragraph XXV, page 33, line 21, the words "that at all times and dates mentioned herein both the Firemen's Fund Indemnity Company and the Pacific Indemnity Company were corporations organized and existing

under the laws of the State of California and citizens of that State. that at all times subsequent to the filing of said cross-complaint and until June 1, 1938, said Fireman's Fund Indemnity Company and said Pacific Indemnity Company were parties defendant to said cross-complaint; that on June 1, 1938, on motion of defendant and over the objection of plaintiff and cross-defendants the said cross-complaint was dismissed as to said corporations."

17.

Strike out the date "4th" in paragraph XXVI, page 33, line 26, and substitute therefor "14th".

18.

Strike out the word "abandoned" in paragraph XXVIII, page 35, line 5, and substitute therefor the word "rescinded." [201]

19.

Strike out the words "abandonment of said work" in paragraph XXIX, page 35, line 10, and substitute therefor the words "rescission of said contract."

20.

Add to paragraph XXX, page 35, the following: "Plaintiff and cross-defendants were justified in so refusing."

21.

Strike out all of paragraph XXXI, commencing on page 35.

22.

Strike out the words "said default of plaintiff," in paragraph XXXII, page 37, line 13, and substitute in lieu thereof the word and figures "June 13, 1936."

Strike out the words "less liquidated damages of $10,000.00 retained by defendant, the net amount being $483,259.16" in paragraph XXXII, page 37, lines 25 and 26.

Strike out all of the last two sentences of paragraph XXXII, commencing with the word "Said" on page 37, line 29, and ending with the word "plaintiff" on page 38, line 8.

23.

Strike out all of paragraph XXXIII, commencing on page 38, and paragraph XXXIV, page 39, and substitute in lieu thereof the following:

"Under the provisions of said contract plaintiff was entitled to 720 calendar days from and after June 14, 1934, plus the number of days it was unavoidably delayed in performing said work, which amounted to an additional 498 days, within which to perform said work. Plaintiff was not required to complete said work under said contract until a date after January 3, 1937, at which time plaintiff would have completed all of the work under said contract." [202]

24.

Strike out all of paragraph XXXV, commencing on page 39, and all of paragraph XXXVI, com-

mencing on page 41, and substitute in lieu thereof the following:

"Defendant is not entitled to recover from cross-defendants any damages for delay in completing the work under said contract because defendant breached the same in a material respect entitling plaintiff to, and plaintiff did, rescind the same."

"Furthermore, even had defendant not breached said contract and even if plaintiff had abandoned same, defendant would not be entitled to recover liquidated damages for delay at the rate of $500.00 per day under said contract because any damage which defendant might have suffered from delay in performing said work is easily capable of exact ascertainment as to kind and amount. Defendant has suffered no actual damages resulting from any delay in the completion of said work."

25.

Strike out the last sentence of paragraph XXXVII, page 42, lines 7 to 12, inclusive, and substitute in lieu thereof the following:

"At the time of filing the cross-complaint said defendant and cross-complainant did not have a cause of action against the plaintiff and cross-defendants, or any of them, and said cross-complaint was prematurely filed.

"Said contract provides, in paragraph 5 thereof, as follows:

> '5. That the second party further agrees that if the work to be done under this contract and agreement shall be abandoned, or if this con-

tract shall be assigned by the second party, or if at any time the District Engineer shall be of the opinion, and shall so certify in writing to the said first party that the said work or any part thereof is unnecessarily or unreasonably delayed, or that the said second party is wilfully violating any of the conditions or covenants of this contract, or is executing this [203] contract in bad faith, the said first party shall have the power to notify the said second party to discontinue all work or any part thereof under this contract, and thereupon the said second party shall cease to continue said work or such part thereof as said first party may designate, and the said first party shall thereupon have the power to place such and so many persons, and to obtain by contract, purchase or hire, such animals, carts, wagons, implements, tools, material or materials, by contract or otherwise, as said first party may deem advisable, to work at and be used to complete the work herein described, or such part thereof as the agent authorized to superintend the same may deem necessary, and to use such material as they may find upon the line of said work and to charge the expense of such labor and material, animals, carts, wagons, implements and tools to the second party, and the expense so charged shall be deducted and paid by the first party out of such moneys as may be either due or may at any time thereafter become due to

the said second party under and by virtue of this contract or any part thereof.

'In case such expense is less than the sum which would have been payable under this contract, if the same had been completed by the said second party, the said second party shall be entitled to receive the difference, and in case such expense shall exceed the last said amount, then the said second party or its bondsmen shall pay the amount of such excess to the first party on notice from the said first party of the excess so due.'

"Even if plaintiff had abandoned said contract, (which the Court finds it did not do) defendant has never complied with said provision of said contract, or notified cross-defendants, or any of them, of the excess cost, if any, of completing said project, over the contract price therefor. Compliance with said provision of said contract is a condition precedent to the commencement of any action by cross-complainant against cross-defendants and as such condition has never been performed by cross-complainant, the cross-complaint should be dismissed."

26.

Strike out paragraph XXXVIII, page 42, and substitute in lieu thereof the following:

"After rescission of said contract by plaintiff, defendant did not complete the work in the manner in which said contract provided that it should be completed in case of abandonment by plaintiff,

which was to complete it by its [204] own forces, but defendant completed the work by entering into contracts with others to perform the same, which was a breach of the terms of said contract and released cross-defendants and all of them of all liability and obligation to cross-complainant, if any they ever had (and the Court finds that they had none) to pay any excess in the cost of completing said work over the prices stated in said contract for completing same."

27.

Strike out all of paragraphs XXXIX and XL, page 43, paragraphs XLI, XLII, XLIII, XLIV, page 44, paragraph XLV, page 45, paragraph XLVI, commencing on page 45, and paragraph XLVII, page 46, and substitute in lieu thereof paragraphs numbers 5 to 28, inclusive, of plaintiff's and cross-defendants' proposed findings of fact filed herewith.

28.

Strike out all of paragraph XLVIII, page 47, and substitute in lieu thereof paragraph number 74 of plaintiff's and cross-defendants' proposed findings of fact filed herewith.

29.

Strike out all of paragraph XLIX, commencing on page 47, and paragraph L, commencing on page 50.

30.

Add to defendants' proposed findings of fact paragraphs numbers 75 to 78, inclusive, of plain-

tiff's and cross-defendants' proposed findings of fact.

31.

Strike out all of defendant's proposed conclusions of law and substitute in lieu thereof the conclusions of law proposed by plaintiff and cross-defendants and filed herewith. [205]

It is respectfully requested that the foregoing amendments to defendant and cross-complainant's requested findings of fact and conclusions of law on file herein be made and allowed by the Court.

Dated: September 14, 1938.

IN THE UNITED STATES DISTRICT COURT OF THE NORTHERN DISTRICT OF CALIFORNIA, SOUTHERN DIVISION

SIX COMPANIES OF CALIFORNIA, a corporation,

Plaintiff and Cross-Defendant,

vs.

JOINT HIGHWAY DISTRICT NO. 13 OF THE STATE OF CALIFORNIA, a public corporation,

Defendant and Cross-Complainant,

and

HARTFORD ACCIDENT AND INDEMNITY COMPANY, a corporation, FIDELITY AND

DEPOSIT COMPANY OF MARYLAND, a corporation, THE AETNA CASUALTY AND SURETY COMPANY, a corporation, INDEMNITY INSURANCE COMPANY OF NORTH AMERICA, a corporation, AMERICAN SURETY COMPANY OF NEW YORK, a corporation, MARYLAND CASUALTY COMPANY, a corporation, UNITED STATES FIDELITY AND GUARANTY COMPANY, a corporation, THE FIDELITY AND CASUALTY COMPANY OF NEW YORK, a corporation, GLENS FALLS INDEMNITY COMPANY, a corporation, STANDARD SURETY AND CASUALTY COMPANY OF NEW YORK, a corporation, STANDARD ACCIDENT INSURANCE COMPANY, a corporation, MASSACHUSETTS BONDING AND INSURANCE COMPANY, a corporation, CONTINENTAL CASUALTY COMPANY, a corporation, and NEW AMSTERDAM CASUALTY COMPANY, a corporation,

Cross-Defendants.

FINDINGS OF FACT AND CONCLUSIONS OF LAW

[209]

The above-entitled cause came on regularly for trial before the above-entitled court, Honorable Michael J. Roche, Judge presiding, without a jury, a jury having been expressly waived by written stipulation of all the parties hereto heretofore filed in the above-entitled court and cause. Said trial

began on the 12th day of April, 1938; plaintiff and cross-defendant SIX COMPANIES OF CALIFORNIA appearing by its counsel, Messrs. Thelen & Marrin, DeLancey C. Smith, Eugene E. Trefethen and J. Paul St. Sure; defendant and cross-complainant, JOINT HIGHWAY DISTRICT No. 13 OF THE STATE OF CALIFORNIA, appearing by its counsel, Archibald B. Tinning, Esq., and T. P. Wittschen, Esq.; and the cross-defendant SURETY COMPANIES above named appearing by their counsel Messrs. Redman, Alexander & Bacon.

Upon motion of the defendant and cross-complainant, made after the beginning of the trial on the issues made by the cross-complaint and the answers thereto and on the 1st day of June, 1938, the cause of action stated in the cross-complaint of defendant and cross-complainant Joint Highway District No. 13 of the State of California was dismissed as to cross-defendants FIREMAN'S FUND INDEMNITY COMPANY, a California corporation, and PACIFIC INDEMNITY COMPANY, a California corporation.

The dismissal was made over the due and timely objection of plaintiff and cross-defendants.

The court proceeded with the trial of said cause from day to day until concluded, and testimony and exhibits were introduced on behalf of the parties to said action; and now the court being fully advised makes and adopts the following Findings of Fact and Conclusions of Law:

FINDINGS OF FACT

1.

Plaintiff is a corporation duly organized and existing [210] under and by virtue of the laws of the State of Nevada and is and at all times herein mentioned has been, a citizen and resident of the State of Nevada and at all times herein mentioned has been and now is, a duly licensed contractor under the laws of the State of California.

2.

Defendant is a public corporation duly organized and existing under and by virtue of the laws of the State of California and at all times herein mentioned has been and now is a citizen and resident of the State of California.

3.

Each of the cross-defendants, hereinafter mentioned, at all the dates and times herein mentioned and at the time of the filing of said cross-complaint, was and is now a corporation duly incorporated, organized and existing under and by virtue of the laws of one of the several States of the Union as hereinafter in this paragraph respectively designated for each of said respective cross-defendants:

(a) Hartford Accident and Indemnity Company, a Connecticut corporation;

(b) Fidelity and Deposit Company of Maryland, a Maryland corporation.

(c) The Aetna Casualty and Surety Company, a Connecticut corporation;

(d) Indemnity Insurance Company of North America, a Pennsylvania corporation;

(e) American Surety Company of New York, a New York corporation;

(f) Maryland Casualty Company, a Maryland corporation;

(g) United States Fidelity and Guaranty Company, a Maryland corporation; [211]

(h) The Fidelity and Casualty Company of New York, a New York corporation;

(i) Glens Falls Indemnity Company, a New York corporation.

(j) Standard Surety and Casualty Company of New York, a New York corporation;

(k) Standard Accident Insurance Company, a Michigan corporation;

(l) Massachusetts Bonding and Insurance Company, a Massachusetts corporation;

(m) Continental Casualty Company, an Indiana corporation;

(n) New Amsterdam Casualty Company, a New York corporation.

The Pacific Indemnity Company, a California corporation, and the Fireman's Fund Indemnity Company, a California corporation, were parties cross-defendant to the cross-complaint when the trial commenced and until June 1, 1938, when they were dismissed over the objection of plaintiff and cross-defendants.

4.

This action is one of a civil nature between citizens of different States and the amount in contro-

versy exceeds the sum of $3,000.00 exclusive of interest and costs.

5.

On June 14, 1934, defendant executed a contract in writing with plaintiff which was dated June 4, 1934, providing for the construction by plaintiff for defendant of a project consisting of a highway and two tunnels and appurtenant structures. The work provided for in the contract began at Keith Avenue and Broadway Street, in the City of Oakland, Alameda County, California, from which point highway work and structures, such as overhead crossings, culverts, and similar [212] structures were to be constructed for a distance of about two and one-half miles in a northeasterly direction, at which point the highway entered two tunnels, one for east bound traffic and one for west bound traffic, the work ending just beyond the easterly ends of the tunnels which were each approximately 2,910 feet in length. The easterly end of the work was in Contra Costa County, California, the boundary line between Alameda County and Contra Costa County intersecting the tunnels. The east bound tunnel is also known as the "up grade" or "south" tunnel; and the west bound tunnel is also known as the "down grade" or "north" tunnel. At each end of the tunnels large portal buildings to house ventilating machinery and other equipment were included in the work to be done under the contract. The tunnels were to be constructed on a grade of approximately 4%, rising from the westerly to the easterly ends.

6.

Prior to executing the contract defendant duly complied with all the provisions of the laws of the State of California relating to its formation and the execution by it of contracts for construction work and said contract was duly and regularly entered into in full compliance with the laws of that State.

7.

Said contract was entered into by plaintiff and defendant after defendant had published a call for bids on May 7, 1934, inviting bids to be submitted on May 22, 1934, for the contract for constructing said project. Plaintiff, in response to this invitation for bids, submitted its bid for said contract on May 22, 1934. The bid submitted by plaintiff was the lowest and best bid for said contract and plaintiff was thereafter awarded said contract by defendant.

The call for bids stated that bidders might secure [213] a complete copy of the plans and specifications for the work at the office of the district engineer of defendant.

Prior to submitting its bid plaintiff was furnished by defendant with a copy of the plans and specifications referred to in the call for bids. Said specifications stated, among other things, that a report on the geological structure of the ground through which the tunnels would pass was on file in the office of the district engineer and was available for inspection by prospective bidders.

Prior to advertising for bids for the contract for constructing its project defendant had caused to be

prepared and filed in its office a geological report stating the character, nature and condition of the ground through which the tunnels to be constructed under said contract would be driven. Said report was the one referred to in said specifications and prior to the submission of its bid plaintiff was furnished by defendant with a copy of that portion of said report stating the character, nature and condition of the ground through which said tunnels would be driven.

8.

Said plans, specifications and geological report referred to in paragraph 7 were so furnished by defendant to plaintiff prior to the submission by plaintiff to defendant of said bid and prior to the parties entering into said contract, for the purpose of inducing plaintiff to submit to defendant a bid for said contract and of inducing plaintiff to enter into said contract and for the further purpose of informing plaintiff as to the character and nature of the ground through which said tunnels would be constructed and for the purpose of causing plaintiff to believe that, for most of the length of both of said tunnels, the ground through which they would be constructed would be self-supporting and for the [214] purpose of inducing plaintiff to submit a lower bid than it would have submitted if it had known the actual condition of said ground.

9.

Plaintiff computed its costs, the amount of its bid and the time which would be required to perform

the work under said contract upon the information contained in said plans, specifications and geological report and the same were furnished by defendant to plaintiff for the purpose of causing plaintiff to do so.

10.

Said geological report stated that the ground through which the tunnels would be driven would be self-supporting for most of the length of the tunnels. It concluded with the following statement:

"In a general way the rocks and rock structures that would be encountered in the proposed tunnel are favorable from the engineering standpoint. The strata mostly dip at high angles and are intersected by the tunnel at a high angle to their trend. Such a condition restricts the width of belts that may show local weakness or much water, and presents the strongest arrangement of the type of strata involved, and the easiest to deal with in tunneling.

"Throughout the main belt of cherts, the rocks may be expected to be entirely self-supporting indefinitely; in the fault belt of cherts and in the Orindan, with proper care in driving and handling, the rocks should stand well and be self-supporting except possibly along certain shear zones which may require local reenforcement to withstand local pressure (not general weight). These statements do not refer to any measures that may appropriately be taken to prevent the detachment or falling of

fragments or blocks from the surfaces exposed by the tunnel, but to general support of the mass of rock in the sides and roof of the tunnel.

"Near the portals the rocks will probably be found weak and will require positive support to prevent movement or caving."

The term "self-supporting" as used in said geological report is a technical term and as customarily used in connection with the construction of tunnels, and as used in said geological [215] report, means that said tunnels could be excavated and lined without the necessity of artificially supporting the ground through which they were to be driven and that said ground would not require support between the time of the excavation of said tunnels and the time of the installation therein of the permanent concrete lining provided for in the specifications.

11.

Said specifications so furnished by defendant to plaintiff contained the following provisions, among others, to-wit:

"(e) Timbering.—The term 'Timbering' as used herein shall include all wooden pieces or structures used to support the earth or rock adjacent to any excavation. . . .

"It is the general intent of these specifications that all timbering shall be removed from the excavation before concrete is placed. Should conditions arise where, in the opinion of the District Engineer, it is impracticable to remove

certain timbers or structures, such timbering, upon the written consent of the District Engineer, may be permitted to remain, subject, however, to the provisions herein contained in respect to clearances outside of the concrete lining. Timbers allowed to remain in place shall in no case project into the neat lines of the concrete structure, and, in the event that it is apparent, during the process of excavation and timbering, that the safety of the excavation will require timbering to remain in place, the Contractor shall enlarge the excavated section to the extent necessary to set the timbers outside of future concrete lines; timbers found to project within the concrete lines shall be removed and reset before concreting. Permission to allow timbers to remain will not be granted for any other reason than to secure the safety of the structure.

"Where timber is allowed to remain it shall be keyed or wedged firmly against the adjacent rock or earth, and shall be securely fastened, spiked or bolted so that no movement, shifting or settlement shall occur. . . .

"Timbering shall be placed in such a manner as to be readily removed, without endangering the safety of the excavation or causing weakness or excessive stresses in adjacent timber sets or concrete structures, and any damage which may occur shall be remedied by the Contractor at his own expense, including the removal and replacement of any concrete which

has, in the judgment of [216] the District Engineer, been damaged or subjected to excessive loads on account of such operations.

"Lagging behind timber sets shall be restricted to the least extent consistent with safety, and, if, in any case, permitted by the District Engineer to remain permanently in place, shall be so spaced as to permit the unrestricted flow of concrete through the lagging to fill any spaces between the lagging and the excavated surfaces."

(Section 32, subdivision 5 (e).)

"Types of Tunnel Section.—Two typical tunnel sections are shown on the plans. The District Engineer shall determine which section shall be used in any specific location in order to meet varying conditions which may be encountered. In general, it is expected that the Type "A" section will be used throughout the major length of the tunnels, but if conditions arise which, in the judgment of the District Engineer, require the use of Type "B" section, the Contractor shall make such modifications in construction as may be necessary."

(Section 32, subdivision 5 (g).)

". . . Where timber is employed for tunnel timbering it shall be removed before any concrete is placed, and any spaces outside the neat lines of the concrete structure caused by such removal shall be filled with concrete as above

provided. In the event that it is found impracticable, in the opinion of the District Engineer, to remove timbering or portions thereof, such timbering may be allowed to remain permanently in place, but in no case shall such timber so remaining be allowed to project into the neat lines of the concrete structure. Where timber is permitted to remain, all spaces outside of the neat lines of the concrete structure shall be filled with concrete mixed in the same proportions and placed at the same time as the concrete in the neat structure. . . ."

(Section 32, subdivision 5 (b).)

The portions of the specifications last hereinabove quoted placed the obligation upon the contractor to remove, prior to installing the concrete lining in the tunnels, any timber theretofore placed therein. These clauses in the specifications implied that the tunnels would be constructed through self-supporting ground, and were improper clauses to place in specifications for the construction of tunnels in ground of the kind actually encountered in the construction of the tunnels here [217] involved. Said clauses were likewise a representation to the bidder and the contractor that the ground through which the tunnels would pass was, and would be found to be, self-supporting, and ground which would stand without artificial support until the installation of the permanent concrete lining therein.

12.

When tunnels are constructed through ground that is not self-supporting, timber cannot practicably be removed before the concrete lining is placed and said provisions of said specifications constituted representations by defendant to plaintiff that the ground through which said tunnels would be constructed would be for the most part self-supporting and confirmed the statements in said geological report as to the self-supporting character of the gruond through which said tunnels would be driven.

13.

The specifications contained no provision describing or requiring any permanent timbering nor did the plans contain any drawing or description of the manner of, or lay-out for, installing any timbering. It is customary to include a plan, or lay-out, for timbering in the plans for a tunnel when installation of permanent timber supports is expected to be necessary or proper.

14.

The absence of any such plan, or lay-out, in these plans and specifications justified plaintiff in believing that defendant believed that no permanent timber supports for the ground would be necessary and further confirmed the statements in the geological report that the ground through which the tunnels were to be constructed would be, for the most part, self-supporting. [218]

15.

Defendant also directed the attention of plaintiff, prior to the submission of its bid, to a test bore or drift at the site of the proposed tunnels and immediately to the west thereof and on the line of one of the tunnels, which drift was approximately 125 feet long. This test drift ended in firm self-supporting rock. Defendant also directed the attention of plaintiff to certain test pits which defendant had caused to be dug over and along the line of the tunnels and to ground exposures in the neighborhood of the tunnels to be constructed.

16.

Plaintiff's attention was directed to said test bore or drift for the purpose of informing plaintiff as to the character of the ground to be encountered in excavating said tunnels. Plaintiff relied upon the information it derived from its inspection of the test drift in formulating and submitting its bid and in making its estimate of the cost of construction of the tunnels and in planning its methods of doing the work in the tunnels.

None of the ground encountered by plaintiff in excavating the tunnels was of a self-supporting kind or character as was the rock at the end of the test drift.

17.

Plaintiff was furnished by defendant, prior to submitting its bid, with an estimate, made by defendant's engineer and adopted by the defendant,

of the cost of constructing said tunnels, which estimated cost was $2,010,800.00 and which was approximately the cost estimated by plaintiff for constructing said tunnels in determining the amount of its bid for said contract.

18.

Defendant's engineer, in making said estimate of the [219] cost of constructing said tunnels, did so in the belief that the ground through which they would be constructed would be self-supporting and of the character described in the geological report and specifications. Had said engineer, at the time he made said estimate, known the actual condition of said ground, his estimate of the cost of constructing said tunnels would have been much greater.

19.

Plaintiff, prior to submitting its bid, employed engineers and men with long experience in constructing tunnels, to make an investigation of the proposed project of defendant and to prepare an estimate of the cost of constructing said project as a basis for a bid to be submitted by plaintiff to defendant. Said persons so employed by plaintiff made such investigation, read and examined said specifications and geological report, and examined said plans and estimate of costs furnished to plaintiff by defendant. Said persons, in making said estimate of costs, believed, in good faith, said statements in said geological report that the ground through which said tunnels were to be driven would be self-sup-

porting and the statements in said specifications confirmatory thereof that the timber, if any was required, could be removed before the concrete lining was placed in said tunnels and relied upon the truth and accuracy of said statements in making an estimate of the cost of doing said work and of the time which would be required to do the same. Said persons also, in making said estimate, relied upon the design of said tunnels, as disclosed by said plans, which also confirmed the statement in the geological report that said ground would be self-supporting.

20.

Because of said statements in said geological report and said specifications with respect to timbering and the [220] removal thereof, the design of said tunnels as disclosed by said plans, the estimate of costs of constructing said tunnels prepared by defendant's engineer and the character of ground disclosed by the test drift and test pits shown to plaintiff by defendant, plaintiff was led to and did in fact believe, at and prior to the time of the submission by it to defendant of its bid for the contract and at and prior to entering into the contract, that the ground to be encountered in driving and excavating said tunnels would be of the character described in the geological report and would be self-supporting and plaintiff's bid for the contract was prepared and delivered by it to defendant and the contract was entered into by plaintiff, in said belief and in full reliance on said information furnished

to it by defendant. Plaintiff would not have submitted said bid nor entered into said contract except for its belief that said statements and information were true.

21.

Prior to the submission of its bid said persons employed by plaintiff visited the site of the proposed tunnels on several occasions and made a careful inspection of the test drift and test pits exhibited to them by defendant and also made a careful examination in the vicinity of the site of the tunnels of rock exposures of the character described in the geological report furnished by defendant. Nothing was disclosed by such examinations which indicated that said statements in said geological report and said specifications were not true and correct. Insufficient time was provided between the publication of notice to bidders and the date of receiving bids, for plaintiff, or any bidder, to make test borings along the line of the tunnels or to have a geological study made of the ground conditions through which same would be driven in order to verify the statements made in the geological report and [221] specifications as to the self-supporting character of the ground and the examination and investigation made by plaintiff's representatives of conditions at the site of the work was as complete and full an examination as reasonably could have been made within the time available. It is not customary for bidders on tunnel projects to make borings or geological investigations of ground

through which the tunnels are to be constructed. Plaintiff and its employees and representatives were entitled to, and did, rely on said information furnished to them by defendant in making their estimate of the cost of constructing said tunnels and the time which would be required to construct the same. Plaintiff did not know, at or prior to the time it entered into said contract, the actual nature, character and condition of the ground through which said tunnels were to be constructed, or that it was not self-supporting.

22.

In making its estimate of the cost of constructing said tunnels and the time which would be required to construct the same, plaintiff planned and developed a definite method of procedure which it proposed to follow, which plan of procedure was based on the statements in the geological report as to the character of ground which would be encountered, the provisions of the plans and specifications confirmatory thereof and its examination of ground conditions at the site which also confirmed the conclusions stated in said geological report.

23.

Because of the representations and statements so contained in said geological report, plans and specifications concerning the ground conditions which would be encountered in constructing said tunnels, plaintiff, in making its bid and entering into said contract planned to do and perform the work in the manner hereinafter set forth. [222]

24.

Plaintiff planned to excavate the west portals for a distance of forty feet by the circumferential drift method, that is by constructing a series of small drifts around the perimeter of the tunnel, placing the timber and thereafter removing the core. This is the slowest and most expensive method of excavating tunnels and is used only when the ground is not self-supporting. Plaintiff adopted this plan for this section because the geological report stated that it would require support.

In driving through the sandstone formation, immediately east of the west portal section, which said geological report stated would be the first bedrock formation encountered and which would continue for about 700 feet, plaintiff planned to use the wall plate system. This system consists of excavating drifts on each side of the tunnel at about the bottom of the arch of the roof and placing horizontal timbers therein, called wall plates, which are supported by the bottom of the drifts at one end and, where they protrude from the drifts, by vertical timbers inserted under them which rest on blocks on the floor of the tunnel. After the wall plates are in position a ring of material is excavated along the perimeter of the tunnel across the roof from one wall plate to another and timbers are placed which rest on the wall plates and support the roof of the tunnel. The core is then removed.

This system is customarily used where the ground requires some support although not sufficiently un-

stable to require the use of the circumferential drift method and was adopted by plaintiff because plaintiff believed, from the information and data furnished to it by defendant, that the sandstone formation, while not entirely self-supporting, would be ground permitting use of this method. [223]

Plaintiff planned, in driving through the chert and orindan, which, according to the geological report, began at the easterly end of the sandstone formation and extended for about 2,000 feet in each tunnel to the easterly end of each of the tunnels, to use what is known as the "full face" method. Under this method no drifts are driven in advance, but the full face of the tunnel is blasted loose and the material is then removed by power shovels and electrically operated cars. This is the fastest and most economical method of excavating tunnels and is customarily employed where practicable. It can only be employed, however, when the ground through which the tunnels are being driven is self-supporting. Plaintiff planned, after excavating a section of the tunnel by this method, to timber lightly, principally to protect workmen from falling rocks, but did not plan to install timbers in those sections for the support of general weight. Plaintiff planned to use this method of excavation in these sections because of the statement in said geological report that the ground would be self-supporting.

Plaintiff planned to leave the timber in place for a distance of 40 feet easterly from the west portal and in the sandstone section and place the concrete lining against it.

Plaintiff planned to remove the timber from the chert and orindan sections before placing the concrete lining.

Plaintiff planned to excavate the tunnels at an average rate of 10 feet per day each and to complete their construction by December 1, 1935.

This plan of excavating and lining the tunnels was adopted by plaintiff prior to submission of its bid and formed the basis upon which it estimated the cost of doing that part of the work under the contract and the time which would be required to do it. [224]

25.

The progress per day which can be made in excavating a tunnel has a very material bearing on the cost. The more feet per day that are excavated the cheaper the work is done.

26.

If the ground through which the tunnels were excavated had been of the kind and character described in the geological report, which was confirmed by the provisions of the plans and specifications, particularly those concerning timbering and the planned design, and by the test drift and pits shown to plaintiff by defendant, the plan of driving and excavating the tunnels so adopted by plaintiff would have been practicable and feasible and plaintiff could have excavated said tunnels and completed their construction, in the manner it expected to and within the time estimated by it. Plaintiff's plans

were in accordance with good practice in the construction industry in driving tunnels through ground of the character so described. In formulating said plans plaintiff relied upon and was entitled to rely upon, the statements in said geological report, plans and specifications and the information derived from the test drift and test pits exhibited to it by defendant.

27.

Said contract, plans and specifications had been prepared by defendant and the tunnels had been designed by it.

28.

The work to be done in the tunnels consisted of excavating the material through which same were to be driven, and constructing a concrete lining around the outer perimeter of the excavation, which was 2 feet in thickness at the top of the tunnels, increasing in width as same reached the foundation thereof on each side. The concrete lining was to be of the neat thickness shown on the plans without intrusion into the [225] same of any temporary supports erected for construction purposes. There was also provision for building ventilating flues within the lining. The design of the tunnels provided for a clear area between the side walls of approximately 24 feet, and a height from the level of the paved road at the bottom of the same to the top of the arch of approximately 35 feet. At about the spring line of the arch of the tunnels, or about 18 feet above the ground level, a ceiling across the same

without important structural features was designed to be built so as to leave the remaining upper space of the tunnel for a ventilation chamber, so that the traveled section of the tunnel would be about 24 feet in width by 18 feet in height. The ventilating chamber was for the purpose of receiving and discharging air for ventilation through the flues provided in the walls. The work to be done included the necessary excavation and installation of the lining, the ventilating flues, the ceiling, and a pavement slab for a roadway at the bottom of the tunnels, and all work necessary to complete the tunnels under the plans.

The contract also provided for the construction of a heavy invert section for an estimated distance of 200 feet in both tunnels at a price $75.00 higher per linear foot than for the portion constructed without such invert. The invert was intended to be used at points in the tunnels where the ground conditions were represented to be bad; and the construction of same would have added great strength to the design.

The design of the tunnels was for a long, flat arch side reaching an apex under conditions which indicated the tunnels were expected by the designer to be driven through self-supporting ground, as the design called for slight resistance at and immediately above the spring line of the tunnels to side pressures from the surrounding ground. The portion of the [226] tunnels to be built with the invert section were described in the contract as "Type B"

section, and the remainder of the tunnels were described as "Type A" section. The plaintiff was justified in concluding that only about 200 feet of ground to be encountered in constructing the tunnels would be of difficult character. The flat arch type design of the tunnels was not a design which would be adopted for difficult ground conditions, or which would be safe to construct in ground conditions which were not unusually favorable to tunnel construction.

29.

Said contract, although dated June 4, 1934, was not executed by defendant until June 14, 1934.

30.

The specifications forming a part of said contract contained the following provision:

"Section 4. Time

"(a) Commencement of Work.—The Contractor shall commence work within ten (10) days after the execution of the contract for the work by the Board of Directors and shall continue without interruption unless otherwise directed by the District. At least three (3) days before starting, the Contractor shall notify the District Engineer in writing of the date that work is to commence.

"(b) Completion of Work.—The time of completion of the entire work specified herein shall be within a period of seven hundred and twenty (720) calendar days from the date of

the execution of the contract by the Board of Directors.

"(c) Extension of Time.—The time during which the Contractor is delayed in said work by Acts of God, or by stormy or inclement weather, or by any reason which, in the judgment of the District Engineer, unavoidably delays the work, shall be added to the aforesaid time for completion, provided that the Board of Directors approve in advance the written application therefor, which must be made by the Contractor for such an extension, before the expiration of the time limit fixed herein, or a duly granted extension thereof.

"(d) Damages for Delay. — The parties hereto expressly stipulate and agree that time is the essence of this contract. In case the work is not completed within the time specified in the contract or within such extensions of the contract time as may be allowed [227] as herein provided, it is distinctly understood and agreed that the Contractor shall pay the District as agreed and liquidated damages and not as a penalty five hundred dollars ($500.00) for each and every working day which may elapse between the limiting date as herein provided and the date of actual completion of the work, said sum being specifically agreed upon as a measure of damage to the District by reason of delay in the completion of the work; it being expressly stipulated and agreed that it would be imprac-

ticable to estimate and ascertain the actual damages sustained by the District under such circumstances; and the Contractor agrees and consents that the amount of such liquidated damages so fixed, shall be deducted and retained by the District from any money then due, or thereafter to become due, the Contractor."

Subdivision (d) of the foregoing section was contained in the specifications but was not in the contract or bond. There is no provision in the contract or bond providing for liquidated damages for delay.

31.

The date upon which the work was required to be completed, if plaintiff was entitled to no extensions of time, was June 3, 1936.

32.

Plaintiff commenced work under said contract on or before June 14, 1934, and after assembling the necessary plant and equipment started to excavate the cut which formed the approach to the west portals of the tunnels. Excavation of said cut commenced in June of 1934 and was completed about July 28, 1934.

During the excavation of this cut slides occurred, without fault of plaintiff, which increased the required excavation about 20,000 yards over the estimated amount and delayed the work for at least 7 days.

33.

Excavation at the west portal of the tunnels proper was commenced by plaintiff on August 1, 1934, and continued until August 10, 1934, when it became necessary to stop further [228] excavation in the tunnels until the portal building at the west portal could be constructed to such a point that the two operations would not interfere with each other.

Excavation was resumed in the tunnels on August 23, 1934, and carried on continuously thereafter until the drifts had been excavated for a distance of 92 feet in the south tunnel and 110 feet in the north tunnel, the excavation for this distance having been carried on by the circumferential drift system, differing, however, from that which plaintiff planned to use in that, because of the heavy, unstable ground encountered, plaintiff was required to increase the number of drifts, decrease their size and leave the core in until the concrete lining was placed. Excavation was stopped at these points in the tunnels because it was necessary that they be lined with concrete before the winter rains set in and the ground encountered thus far was so unstable that the core could not be removed so as to permit excavation to proceed while the lining was being done.

Excavation of the south tunnel drifts for a distance of 92 feet was completed October 13, 1934, and the concrete lining was completed in that portion of the south tunnel on November 5, 1934. The work was then stopped by order of defendant's engineer for

21 days, after which the core was removed which operation required 13 days.

Excavation of the north tunnel drifts commenced September 1, 1934, and they were excavated and the tunnel lined a distance of 110 feet by October 27, 1934. The work on this tunnel was then stopped by an order of defendant's engineer for 21 days, after which the core was removed which required 8 days.

The ground encountered in excavating these sections of both of these tunnels was heavy, unstable and exerted heavy [229] pressures at all times. It was partly mud, partly badly broken and shattered rock, and was nowhere self-supporting. Plaintiff excavated and lined these portions of the tunnels as expeditiously as possible. The delay beyond the estimated time for excavating and lining these portions of the tunnels was caused by the ground conditions encountered, was unavoidable and was not due to any fault of plaintiff. Said conditions caused a minimum delay of 30 days to plaintiff in the performance of the work.

34.

After plaintiff had completed excavating and lining the portions of the tunnels at the west portals described in paragraph 33 hereof, it resumed their excavation on or about December 5, 1934. It completed excavation of the core in the concrete lined portions of the tunnels and commenced further excavation on the core of the north tunnel on January 5, 1935 and on the core of the south tunnel on January 21, 1935, and thereafter proceeded with the excavation of the tunnels without cessation until

August 21, 1935. Resumption of excavation on the core beyond the concrete lining was necessarily delayed until drifts could be advanced far enough to permit of its removal. From January 21, 1935, to August 21, 1935, the core of the south tunnel was excavated a distance of 1,212 feet, having passed through the sandstone and penetrated the chert for a distance of approximately 450 feet. The core of the north tunnel had been excavated during the period from January 5, 1935, to August 20, 1935, for a distance of 958 feet likewise having passed through the sandstone and penetrated the chert for a distance of approximately 200 feet.

During this period of time plaintiff excavated on the average 4.20 feet of tunnel per day in the north tunnel and 5.69 feet per day in the south tunnel, said averages being based on excavation of full tunnel, including core.

35.

During this entire period as well as during all times [230] while engaged in the construction of these tunnels, plaintiff prosecuted the work diligently and made all progress possible under the ground conditions encountered.

36.

Plaintiff at all times had adequate and sufficient excavating equipment and tools on the work. It prosecuted the work 24 hours a day, except for one shift of six hours Sunday afternoons and except when the work was stopped by defendant's engineer or by other conditions over which plaintiff had no

control. The cessation of work for one shift on Sunday afternoons was necessary to comply with provisions of the contract concerning hours of labor. Plaintiff at all times pursued proper methods of excavation. The failure to make more progress was due solely to the character of the ground.

37.

At no place encountered in said further excavation of said tunnels, with the possible exception of one or two places extending for not more than 10 or 12 feet of the length of the tunnels, was the ground self-supporting. It was broken, treacherous, unstable and developed heavy pressures. The rock was badly shattered and the same and all of the ground required heavy timbering to support it. At no place could it be excavated by the full face method or in accordance with the plan of excavation which formed the basis of the bid of plaintiff.

Because of the character of the ground, as herein found, the timber could not be removed before the concrete lining was placed. Therefore, plaintiff, of necessity, set the timber supports outside the area where the specifications provided that the concrete lining should be placed. This made it necessary for plaintiff to excavate approximately fifteen per centum more material from the tunnels and furnish and install five times more board feet of timber than would have been required had it been able to remove the timbers before the concrete was placed, resulting in increased cost and a longer time for performing the excavation work. [231]

38.

Plaintiff planned on placing the concrete in the lining of the tunnels by the use of a pneumatic concrete gun. This was the customary and only practical method of placing such concrete at the time plaintiff and defendant entered into said contract. The method consists of forcing the concrete by compressed air into the forms.

Plaintiff used this method in placing the concrete in that portion of the tunnels described in paragraph 33.

Because of the requirements of the specifications and the interpretation placed upon them by the engineer of defendant a great amount of difficulty and delay was encountered in attempting to place the concrete lining with the pneumatic gun. Furthermore, when the forms were stripped the concrete so placed was not entirely satisfactory to defendant's engineer and plaintiff was told by defendant's engineer that it would have to devise and use some other method for placing the remainder of the concrete lining in the tunnels.

Subsequent to the execution of said contract there had been developed a machine for placing concrete known as the pumpcrete, which pumped the concrete into the forms instead of forcing it in by compressed air. This machine had been used successfully for a year or two on certain structures but was still in the experimental stage so far as placing the lining in large tunnels similar to the ones herein involved was concerned.

When the trouble developed in placing the concrete lining with the pneumatic gun, plaintiff communicated with the manufacturers of the pumpcrete with the object of securing one of these machines to place the concrete lining. Many difficulties were encountered in working out a satisfactory design and plaintiff and the manufacturers were not able to accomplish this and get the pumpcrete delivered to the work until June, 1935. In the meantime the excavation proceeded, but no concrete lining [232] was placed because plaintiff had not been able to secure delivery of this machine earlier and placing the lining by pneumatic gun method was not satisfactory to the defendant's engineer. Plaintiff used every reasonable effort to secure delivery, and did secure delivery, at the site of the work at as early a date as possible of equipment which would place said concrete lining in a manner satisfactory to defendant's engineer.

39.

During June, July and early August of 1935, the ground encountered in each tunnel developed increasingly heavy pressure and plaintiff experienced extreme difficulty in placing timbering heavy enough to hold it in place at all. The timber in that part of the tunnels which first had been excavated, which was through the sandstone, in some places had moved in shortly after the excavation at those points because of pressure of the ground at such points. No movement, however, took place at those

points except such as occurred within a few days after the timber supports were placed. On the other hand, the timber supports placed in the chert which was excavated in June, July and August, 1935, were showing movement and heavy pressure and had to be constantly repaired and replaced.

For this reason plaintiff, on August 21, 1935, stopped further excavation in the tunnels until the concrete lining could be installed in the excavated portions of the tunnels to a point approximately 200 feet from the easterly end of such excavated portions.

Plaintiff started to pour and install the concrete lining in the tunnels the first week in July of 1935, with the use of the pumpcrete and continued said pouring and installation thereafter until June 13, 1936. [233]

40.

On August 21, 1935, in certain parts of the tunnels which had been excavated at that time, the timber had been forced by the pressure of the ground into the area where the concrete lining was required by the specifications to be placed. Defendant's engineer insisted that such timber be trimmed or moved back before the lining was placed and in order to comply with his directions and the specifications, plaintiff proceeded to trim the timber in places where the intrusion was slight and to set it back in places where the intrusion was so great that it could not be trimmed sufficiently without weaken-

ing it to the point where it would faii as a support for the ground.

One of the points at which the timber had intruded so far that it had to be reset was at station 114 in the north tunnel, which was a point about 150 feet easterly from the end of the concrete lining which had been installed prior to August 21, 1935. The tunnel at this point had been excavated during February, 1935. Within a very few days after it was excavated at this point the timbers had intruded into the area in which the concrete lining was to be placed. They were braced at the time they intruded into the area of the concrete lining and in August of 1935 had shown no movement for a period of six months.

On August 28, 1935, while timbers were being reset at said station 114 in said tunnel, a cave-in occurred which completely filled the tunnel for a distance of approximately 100 feet. The resetting and retimbering operations were being carried on in a careful and workmanlike manner and in accordance with approved practice and the cave-in was not caused by any fault of plaintiff.

41.

Immediately following the cave-in the Superintendent [234] of Safety of the Industrial Accident Commission of the State of California ordered plaintiff not to do any further work without his approval and ordered that no timbers be reset or trimmed. This limited plaintiff's operations to con-

creting in those portions of the south tunnel where no trimming or resetting of timbers was required to be done.

Plaintiff proposed to defendant on September 1, 1935, that the design of the concrete lining be slightly altered so as to avoid the necessity of removing or trimming timbers. The proposed alteration was approved and authorized by said Commission, but defendant refused, on September 5, 1935, to permit it. On September 14, 1935, plaintiff notified defendant and said Commission that it would proceed to install the lining in accordance with the specifications. On September 19, 1935, the Commission ordered both plaintiff and defendant to stop all operations which involved removing or resetting timbers before concreting, and stated that some plan whereby the timbering would not be disturbed might be submitted to the Commission for approval.

42.

At a hearing held by said Commission on September 24, 1935, a plan for the modification of the concrete lining was submitted by defendant which would eliminate the necessity of trimming and removing timbers. This plan was satisfactory to the Commission.

Immediately following said hearing plaintiff proceeded as rapidly as possible to line with concrete the portions of said tunnels which had been excavated, although formal permission to alter the de-

sign of the concrete lining in accordance with said plan was not given by defendant until November 8, 1935. [235]

43.

The lining of the north tunnel was not completed to such an extent that it was possible, under conditions existing, for plaintiff to resume excavation in that tunnel until December 22, 1935, and in the south tunnel until November 26, 1935.

44.

If the ground through which the tunnels were being excavated had been of the character described in the geological report furnished by defendant to plaintiff it would not have been necessary for plaintiff to have stopped the excavation of the tunnels on August 21, 1935, until the concrete lining had been installed in the excavated portions thereof, but plaintiff could have continued with the excavation of the tunnels at the same time that it was installing the concrete lining in the portions already excavated.

Furthermore, if the ground had been as represented in said report the timbers would not have intruded into the area where the concrete lining was to be placed and it would have been unnecessary to reset or trim any timbers.

45.

The delay in proceeding with the excavation of the north tunnel from August 21, 1935, to Decem-

ber 22, 1935, a period of 123 days, and in proceeding with the excavation of the south tunnel from August 21, 1935, to November 26, 1935, a period of 97 days, was caused by reasons which unavoidably delayed plaintiff in performing the work, namely,

(a) Bad ground conditions differing from those described in the geological report and specifications;

(b) A cave-in which was not the fault of plaintiff;

(c) Delay on the part of defendant and defendant's engineer in failing and refusing to cooperate on a practical plan of proceeding with the work after the emergency resulting from the cave-in; and [236]

(d) Orders of the Industrial Accident Commission of California restricting plaintiff's operations.

Plaintiff commenced removal of the caved-in material in the north tunnel on September 15, 1935, and completed its removal on December 6, 1935. Said caved-in material was removed from said tunnel as speedily as possible.

46.

After excavation was resumed by plaintiff on said tunnels, as stated in paragraph 43 hereof, plaintiff continued to excavate each of said tunnels and line them with concrete until February 22, 1936. The ground continued to be heavy and broken and none of same was self-supporting. It required heavy permanent timbering at all places. At many

points a soft material, known as altered diabase dike, which was not mentioned in the geological report, was encountered.

47.

On February 22, 1936, at the location of one of these dikes, the north tunnel again caved in. The cave-in occurred without warning and unexpectedly at approximately station 126+50 which was a point approximately 1500 feet easterly from the westerly portal of the tunnel. Excavation of this tunnel at this point had been completed 4 or 5 days before February 22, 1936, and the tunnel had been heavily timbered at that same time.

48.

The cave-in was caused by the heavy pressure exerted by the unstable ground and the diabase dike and did not result from any fault of plaintiff.

49.

On February 22, 1936, following the cave-in, the Industrial Accident Commission of California ordered all excavation work on both tunnels stopped until plans for future [237] excavation and driving were approved by the Commission.

50.

On March 16, 1936, the Commission issued and served on the parties an order permitting resumption of excavation in the south tunnel under certain conditions which it imposed and which condi-

tions made the future excavation slower, more difficult and more expensive than would have been the case if plaintiff could have proceeded with the work as it had been proceeding prior to said cave-in. The conditions imposed also made it necessary to obtain new and additional equipment. Plaintiff obtained such equipment as soon as possible, but was unable to obtain it until March 23, 1936, on which date excavation was resumed in the south tunnel.

Removal of the caved-in material from the north tunnel and concreting of that portion of said tunnel was also permitted by said order. However, the same order prohibited further excavation in that tunnel until plans for future excavation and driving were approved by the Commission.

51.

On April 16, 1936, the Commission issued and served on the parties its order permitting resumption of excavation in the north tunnel under conditions similar to those imposed and herein found in connection with the resumption of excavation in the south tunnel and which likewise made the future excavation in the north tunnel slower, more difficult and more expensive than would have been the case if plaintiff could have proceeded with the work as it had been proceeding before the cave-in.

On April 16, 1936, plaintiff had not completed removal of the caved-in material from the north tunnel. The removal of said caved-in material was

accomplished as speedily as possible and was not completed until May 9, 1936. [238]

52.

The delay resulting from stopping the excavation in the south tunnel from February 22, 1936, to March 23, 1936, a period of 31 days, and in the north tunnel from February 22, 1936, to May 9, 1936, a period of 71 days, was caused by reasons which unavoidably delayed plaintiff in performing the work, namely,

(a) Bad ground conditions differing from those described in the geological report and specifications;

(b) The said cave-in of February 22, 1936, which was not the fault of plaintiff; and

(c) Orders of the Industrial Accident Commission of the State of California.

53.

If the ground through which the tunnels were excavated had been self-supporting, plaintiff would have excavated these tunnels a minimum average distance of 9 feet per day each with the forces and equipment which it had and used. The average progress made by plaintiff on the days it was actually engaged in excavation operations was 4-½ feet per day which was a normal and fair rate of progress in the ground actually encountered and as great a rate of progress as could have been made. The difference between a rate of progress in exca-

vating said tunnels of 4-½ feet per day and 9 feet per day was due solely to the fact that the ground was not self-supporting, which cause was entirely beyond the control of plaintiff.

54.

At the time plaintiff stopped work on June 13, 1936, it had excavated 1,843.5 feet of full tunnel in the north tunnel and 2,425.75 feet of full tunnel in the south tunnel. Because of the ground conditions which existed plaintiff necessarily consumed 237 more days in excavating that part of the tunnels excavated by it than it would have taken if the ground had been [239] self-supporting. This is in addition to the time lost as a result of cave-ins and other causes herein found.

55.

The work to be done under the contract to the west of the tunnels included construction of a modern highway which required the making of an embankment for same as well as making certain cuts and construction of certain structures. Plaintiff planned the doing of its work to construct the embankment in the early spring of 1935 and complete the highway work during the dry summer season of the same year. Stormy and inclement weather, including heavy rains greatly in excess of normal, retarded the work in the spring of 1935, and prevented plaintiff from finishing same so as to complete the paving work during the summer of 1935.

Because of this delay it became and was impossible for plaintiff to complete the embankment and paving work until the spring and summer dry season of 1936; and as a result of the stormy and inclement weather above mentioned, and of the rainfall in excess of normal expectations, plaintiff was necessarily delayed not less than 30 days in the completion of performance of the contract beyond the date fixed in same for such performance.

56.

During the progress of the work the following reasons unavoidably delayed the work for the following number of days:

1. Slides during the excavation of the approach cut to the west portal and additional excavation required in excavating that cut over the estimated amount, a minimum of 7 days.

2. Extremely difficult and unstable ground encountered in excavating the west portal sections of the tunnels, together with the difficulty of placing the concrete lining therein and orders of defendant's engineer requiring that operations be stopped for 21 days until the concrete lining set, a minimum of 30 days. [240]

3. Heavy, unstable ground making it necessary to stop excavation on August 21, 1935, the cave-in of August 28, 1935, and orders of the Industrial Accident Commission resulting therefrom, a minimum of 123 days.

4. The cave-in of February 22, 1936, and the orders of the Industrial Accident Commission resulting therefrom, a minimum of 71 days.

5. Heavy, unstable and difficult ground encountered, which was not self-supporting and which retarded the progress of the excavation while actually being performed, a minimum of 237 days.

6. Stormy and inclement weather, a minimum of 30 days.

The total of said unavoidable delays caused to plaintiff and said work is 498 days. None of said delays, except those stated in subparagraphs 1 and 6, would have occurred if the ground conditions encountered in constructing said tunnels had been as described in said geological report, as they were represented to be from the plans and specifications and as they were indicated to be in the test drift and test pits shown to plaintiff by defendant and as they appeared to be from surface indications at the site of the work. All of said reasons for delay were unavoidable and beyond the control of plaintiff and none of them was due to any fault of plaintiff.

57.

Plaintiff had scheduled the performance of all of its work under the contract, including the tunnel portions thereof, and had advised the defendant of its proposed schedule, furnishing a copy of same to defendant. Plaintiff filed its first construction schedule with the defendant in August, 1934, which showed that all tunnel work would be completed on

December 1, 1935. At the time this schedule was submitted to defendant, plaintiff was not in possession of any information, nor had it discovered any conditions, to cause it to know that it could not conform to the plans on which it estimated the work, as herein found. No comment or objection was made by defendant [241] to the schedule so submitted. In February, 1935, and after plaintiff had encountered the difficulties and troubles herein found at the west portal and in the west portal approach, it had become apparent that the schedule filed in August, 1934, could not be fulfilled, and plaintiff thereupon submitted and delivered to defendant a revised construction schedule to replace the one previously filed. This schedule showed that the contract work would be completed on May 24, 1936. This schedule also showed that concrete lining of any portion of the tunnels east of the west portal area would not begin until six months after excavation began therein. No objection or comment on this schedule was made by defendant to plaintiff; and plaintiff was justified in assuming that the schedule had been approved.

58.

After the cave-in of August, 1935, and about the first of the year 1936, plaintiff submitted and exhibited to defendant a further revised construction schedule to reflect the delays encountered since the schedule filed in February, 1935. This schedule showed a completion of the tunnels and work would

be in the month of October, 1936, or approximately 150 days after the contract time had expired. No objection was made to this schedule by defendant, nor was any statement made by defendant to plaintiff that plaintiff would be held responsible for any failure to complete within the contract time. By reason of delays encountered after the schedule last found, and resulting from the cave-in above found of February 22, 1936, the date of the completion of the project was further postponed until January 3, 1937, or a total of 224 days after May 24, 1936. January 3, 1937, was the earliest date on which plaintiff could have completed the work under the contract. [242]

59.

Both plaintiff and defendant were misled by said geological report, test drift, test pits and surface indications as to the character of the ground which would be encountered in constructing said tunnels. Defendant designed the tunnels and prepared the plans and specifications therefor on the assumption and in the belief that the tunnels would be constructed through self-supporting ground for a distance of approximately 2,000 feet in each tunnel and that the timber could be removed from the portions where the ground was believed to be self-supporting before the concrete lining was placed. It based its estimate of the cost of constructing said tunnels and its stipulation in the contract for the time of performance thereof on said belief and assumption. Plaintiff was likewise misled into the be-

lief that most of the ground through which said tunnels would be constructed would be self-supporting. Plaintiff's belief was based on the statements made in said geological report, the surface indications at the site of the work, the test drift and test pits exhibited to it by defendant, the design of the tunnels as shown on the plans adopted by defendant, the provisions in said specifications requiring the removal of timber before concrete lining was placed and all other provisions of the specifications and contents of the plans, and defendant's estimate of cost of constructing said tunnels.

60.

Both parties to the contract entered into same under a mistake of fact, namely that both of said parties believed at the time said contract was entered into, that said tunnels would be constructed, for at least 2,000 feet of the length of each thereof, through self-supporting ground, whereas the ground through which said tunnels were constructed was not self-supporting at all, except for 10 or 12 feet thereof. Said [243] mistake was material and substantial.

61.

The excavation of tunnels through ground which is not self-supporting is much more expensive and requires much more time than through ground which is self-supporting.

62.

The contract and specifications provided in the main that the excavated material, or muck, from the tunnels would be used to make fills on the highway work between the westerly end of the tunnels and the westerly end of the project; and gave the engineer of defendant power to select such material from the tunnel excavation as he felt proper for such use, and reject the balance. It was not possible for the plaintiff to determine until the highway fills were approximately completed how much material out of the total tunnel excavation would be necessary to complete the fills. No other material than tunnel excavation was provided to be used in these fills under the plans and specifications, except some cut material in making the embankment for same which would be insufficient to complete more than a small portion of such fills. There was no provision in the plans and specifications for disposition of any material from the tunnel excavation at the east end of the tunnels, and it was proper for the plaintiff to plan its procedure in construction to excavate the tunnels entirely from the west end if that could be done within the time limits of the contract.

The time limits as fixed in the contract, when taken together with the representations as to the ground conditions to be encountered in the tunnel as hereinbefore found, confirmed the representation of the geological report and the specifications that

the tunnels would be driven through self-supporting ground; and taken with the provisions providing for the disposition of material at the west end thereof, justified the [244] plaintiff in planning to excavate the tunnels entirely from the west end to the easterly end. There was no provision for disposition of material from the tunnels at the east end, and it is customary for the owner of construction work to indicate where the material is to be placed which is taken from tunnel excavation. It is also customary to excavate tunnels from the lower grade end thereof because of the advantage to be gained in the drainage of water and removal of material. This is particularly the fact when the plans show the material to be taken from the tunnel excavation is to be used at the lower grade end thereof, as was shown on the plans and stated in the specifications for these tunnels.

63.

The contract provided that the highway work which was located west of the tunnels should include a finished pavement on the completed highway grade, and that same should be completed during good weather conditions which would give a dry condition for placing same. The highway was to be placed upon fills or embankments made in large part from material excavated from the tunnels; and plaintiff planned its work to complete same during the dry season of the summer of 1935, and would have completed this work during that period

and season if the tunnels had been excavated in self-supporting ground. Due to the delays in excavating the tunnels arising from the nature of the ground encountered, which slowed up the progress of excavation, the highway grade could not be finished and paved prior to the dry season in the spring and summer of 1936; and it would have been impossible for the plaintiff to complete the paving of the highway portions of the work until after June 4, 1936.

64.

On June 10, 1935, plaintiff filed with defendant a written application for an extension of time of 180 days within [245] which to perform the work under the contract.

On July 12, 1935, defendant, in writing, denied said application.

On July 26, 1935, plaintiff, in writing, renewed its said application to defendant.

Defendant took no action on said renewed application.

On August 28, 1935, plaintiff again made an application, in writing, to defendant, reaffirming its application of June 10, 1935, and requesting such additional time as might be necessary to perform the work.

Defendant took no action on said application.

On May 11, 1936, plaintiff again applied to defendant, in writing, for an extension of time within which to complete the work under the contract.

On May 14, 1936, defendant, in writing, denied said application.

65.

Neither said engineer of defendant nor the Board of Directors of defendant, at any time after the filing of any such applications by plaintiff and prior to the denial thereof, granted to plaintiff any hearing thereon or requested any evidence or further reasons in support thereof, or gave to plaintiff any opportunity to present any evidence or reasons in support of same.

66.

Wallace B. Boggs was the duly appointed and acting district engineer of defendant during all of the time that plaintiff was engaged in the performance of work under said contract. Prior to the filing of said applications for extensions of time and on several occasions during 1935 and 1936, representatives of plaintiff told said engineer that plaintiff was going to file such applications. Said representatives of [246] plaintiff further told said engineer that plaintiff had been delayed by bad weather, bad ground conditions, cave-ins and difficulty in procuring an adequate supply of competent labor.

Said engineer stated to said representatives of plaintiff that plaintiff was entitled to an extension of time because of the bad ground conditions, the cave-in of August 28, 1935, stormy and inclement weather and other causes, but stated further that

any application filed prior to just before the expiration of the contract time was premature and suggested the filing of such an application in April, 1936, and further stated that upon said application being then made, defendant would grant plaintiff a sufficient extension of time within which to complete the work under the contract without any enforcement of penalties. Plaintiff relied upon said statements of said engineer and believed, and thereafter acted upon said belief, that defendant would grant to it a sufficient extension of time within which to complete said work.

Said engineer and the members of the Board of Directors of defendant, at all times had full knowledge of the bad ground conditions encountered by plaintiff in excavating said tunnels, of said cave-ins and orders of said Industrial Accident Commission of the State of California, of the unavoidable delays to the work caused thereby and of all of the facts herein found in connection with the doing by plaintiff of the work of constructing said tunnels. Said engineer and the members of defendant's Board of Directors knew, at the time said applications for extensions of time were filed by plaintiff, that plaintiff had been unavoidably delayed in performing the work and was entitled, under said contract, to an extension of time within which to complete the work.

The decision of said engineer that plaintiff was not delayed in said work by Acts of God, or by

stormy or inclement weather, or by any reason which, in his judgment, unavoidably delayed the work was arbitrary, capricious and so grossly mistaken as to amount to fraud and is not binding on plaintiff and [247] the action of defendant in denying to plaintiff an extension of time within which to perform the work was arbitrary, capricious and so grossly mistaken as to amount to fraud.

67.

Plaintiff was entitled, as of right, under said contract, to an extension of time within which to perform the work thereunder equal to the number of days it had been unavoidably delayed in the performance of the work as herein found.

68.

Plaintiff in no way waived its right to said extension of time.

69.

On June 10, 1936, defendant delivered to plaintiff an estimate signed by defendant's said engineer which certified that plaintiff had performed work during the month of May, 1936, of the value of $168,985.53. Defendant deducted from said amount 10% thereof to be retained until the completion of said contract in accordance with the terms thereof. Defendant deducted the further amount of $3,500.00 making the following statement on said estimate in explanation of said deduction: "Deduc-

tions, Damages, Failure to complete within contract time 7 days at $500.00—$3500.00". At the time defendant delivered said estimate to plaintiff it delivered to plaintiff a check for $148,586.98, which was the balance remaining of the value of said work done by plaintiff in May, 1936, as shown by said estimate less said deductions.

70.

On June 13, 1936, plaintiff mailed to defendant said check with a notice of rescission of said contract as follows:

"June 13, 1936

"Joint Highway District No. 13
of The State of California,
1448 Webster Street,
Oakland, California. [248]

"Gentlemen:

"You are hereby notified that the undersigned, Six Companies of California, has elected to and does hereby terminate and rescind the contract dated June 4, 1934, between the undersigned and your District for the construction, erection and completion of the project of said Joint Highway District No. 13 of the State of California, which includes a highway, highway tunnels, and approaches with the appurtenant structures located partly in the City of Oakland, County of Alameda, State of California, and partly in the County of

Contra Costa, State of California, commonly known as the Broadway Tunnel Project.

"Said rescission is made upon the following grounds and each and all of them:

"First: Through your fault the consideration for our obligations under said contract has failed in part in that you have failed and refused to pay us the amount estimated by you to be due us under the monthly estimate for work done during the month of May, 1936. Said failure consists in the deduction by you from the amount estimated by you to be due us for such work of the sum of $3,500 for claimed damages for failure to complete the work under said contract, said deduction being computed at the rate of $500 per day for each day in May 1936 following May 24th, and to and including the 31st day of May, and including such a deduction for a legal holiday, May 30, and a non-working day, Sunday, May 31st. Said deduction was and is contrary to and in violation of the terms of the contract in that we were and are entitled as a matter of right and of law to an extension of time thereunder for performance of same to a date after May 31, 1936; and was and is further in violation of the provisions of the said contract in that any damages for delay in completion of the contract can only be asserted or claimed against the contractor for working days after the contract date for completion.

"Second: That the consideration for said contract has failed in a material respect in that you

have breached said contract by refusing to pay us the amount due us under your monthly estimate for work done during the month of May, 1936. Said failure consists in the deduction by you from the amount due us for such work of the sum of $3,500 for claimed damages for failure to complete the work under said contract within contract time, said deduction being computed at the rate of $500 per day for each day in May, 1936 following May 24th, and to and including the 31st day of May, and including such a deduction for a legal holiday, May 30th, and a non-working day, Sunday, May 31st. Said deduction was and is contrary to and in violation of the terms of the contract in that we were and are entitled as a matter of right and of law to an extension of time thereunder for performance of same to a date after May 31, 1936; and was and is further in violation of the provisions of the said contract in that any damages for delay in completion of the contract can only be asserted or claimed against the contractor for working days after the contract date for completion.

"Third: That in failing to pay said sum mentioned in numbered paragraphs First and Second above and by your refusal to grant said extension of time you have breached [249] said contract, and ground for rescission has arisen in our favor.

"Fourth: That your failure and refusal to grant us the extensions of time to which we are entitled as a matter of right and of law for completion of

said contract after May 24, 1936, although we have repeatedly requested the grant of such extensions is a breach of the contract.

"Fifth: Because the ground encountered in the excavation for the tunnels provided for in the contract has been and is entirely and radically different from the character of ground represented to the contractor as that which would be encountered, and which was contemplated and predicted by the contract, geological report, specifications, plans and any and all other documents forming a portion or part thereof.

"Sixth: For your failure and refusal to furnish points, lines and grades for us to work to and other engineering work in the construction of the tunnels as is required to be done or furnished by you by the terms and provisions of the contract and specifications forming a part thereof.

"Seventh: Because the work which is necessarily required to be done to construct the tunnels under the ground conditions actually encountered at their site is not provided for in the contract and was not contemplated by the parties at the time the contract was made.

"Eighth: For any and all other grounds of rescission of said contract of June 4, 1934 which may have heretofore existed or which do now exist in favor of the undersigned.

"We are returning herewith to you your check #1934 dated June 10, 1936 in purported payment

of the estimate for the work done by us during the month of May, 1936.

Very truly yours,
SIX COMPANIES OF
CALIFORNIA
By HENRY J. KAISER
President."

Said check and notice of rescission were received by defendant on June 15, 1936.

Thereafter and on June 13, 1936, plaintiff stopped all work under said contract and did not thereafter perform any work thereunder except that for a few days it operated pumps and kept watchmen at the site to protect the work.

On June 15, 1936, plaintiff notified defendant that it would cease to operate the pumps and maintain the watchmen at midnight of June 16, 1936. [250]

On June 16, 1936, defendant sent to plaintiff a letter, which was received by plaintiff on or about said date, as follows:

"June 16, 1936

"Six Companies of California
1522 Latham Square Building
Oakland, California

Gentlemen:

"Your letter of June 13, 1936 in which you notified this District of a purported termination and rescission of your contract with this District dated

June 4, 1934, has been received and considered by the Board of Directors of the District, and this reply thereto is made at the direction of the Directors of the District.

"You are hereby advised that Joint Highway District No. 13 of the State of California considers all of the grounds stated by you as a basis for your attempted rescission and termination of the contract are without basis in fact or law; that this District has fully paid all sums required to be paid, performed and done all things required to be performed and done by it under the said contract, and that you, as such contractor, have no valid grounds or reason whatsoever for your attempted rescission and termination of the contract.

"You are advised that your cessation of the work upon the project and your withdrawal of workmen from the construction of the project constitutes an abandonment by you of the work to be done under the contract; that your said acts which unnecessarily and unreasonably delay and continue to delay the work you contracted to perform, and your attempted rescission and termination of the contract, and each and all of them, constitute wilfull breaches of the contract by you.

"You are further advised that unless you as said contractor resume work on the project and perform the same in accordance with all of the terms thereof within three (3) days of the date of your receipt of this letter, that this District will consider your acts and conduct as aforesaid a final abandonment

of the contract and the work to be done thereunder, and the District will proceed to complete the same in accordance with the provisions of the contract, and that the District will hold you and your bondsmen liable for any and all costs thereof in excess of the contract price and any and all damages to this District by reason of your wilfull abandonment of the work in violation of the terms of your contract with this District dated June 4, 1934.

Yours very truly,
JOINT HIGHWAY DISTRICT NO. 13 OF THE STATE OF CALIFORNIA,
By L. V. EATON
Assistant Secretary." [251]

Under date of July 9, 1936, defendant's said engineer made and signed an estimate which stated that the value of the work performed by plaintiff from June 1 to June 13, 1936, both days inclusive, was $96,906.29. Defendant deducted therefrom 10% thereof to be retained until the contract was completed, in accordance with the terms thereof and deducted the further sum of $6,500.00 which was explained on said estimate by the following statement: "Deductions, Damages, Failure to complete within contract time this estimate 13 days at $500= $6500.00."

Said estimate together with a check for $80,715.66, being said amount of $96,906.29 less said deductions was delivered by defendant to plaintiff on

or about July 9, 1936. At the same time defendant again delivered to plaintiff said check in the amount of $148,586.98, referred to in paragraph 69 hereof.

On July 15, 1936, plaintiff returned both of said checks to defendant and delivered to it at the same time the following letter:

"July 15, 1936

"Joint Highway District #13
of the State of California
1448 Webster Street
Oakland, Calif.

"Gentlemen:

"We hereby acknowledge receipt of your check No. 1934 in the amount of $148,586.98 and also your check No. 2201 in the amount of $80,715.66 dated June 10, 1936 and July 9, 1936 respectively.

"By notice dated June 13, 1936, and heretofore delivered to you, the undersigned rescinded said contract for the reasons and upon the grounds stated in said notice. Said checks are hereby returned to you.

Very truly yours.
SIX COMPANIES OF
CALIFORNIA
By HENRY J. KAISER,
Pres.
By T. M. PRICE." [252]

71.

Defendant never tendered to plaintiff or offered to pay to it the amount of $3,500.00 which it deducted from the amount of the payment due for work done in May, 1936, or the amount of $6,500.00 which it deducted from the amount of the payment due for work done in June, 1936, or any part of either of said amounts, but at all times refused to pay the same.

72.

The refusal of defendant to grant to plaintiff any extension of time within which to complete the work under said contract and its action in making said deduction from the payment due for work performed by plaintiff in May, 1936, was a declaration by defendant that it would continue to make deductions at the rate of $500.00 per day from the payments due plaintiff for work done under said contract from and after May 24, 1936, until all of the work under said contract was completed.

Plaintiff would have reasonably required 224 days after May 24, 1936, within which to have completed the work remaining to be done under said contract and the total amount of the deductions which would have been made by defendant, if plaintiff had not rescinded said contract and stopped work, from payments due and to become due for work done thereunder, would have been $112,000.00.

The time for performance of the work under the contract did not expire until June 3, 1936. The de-

duction of $3,500.00 from the amount due for work done in May, 1936, was wrongful and a violation of the rights of plaintiff under the contract and was a breach of the contract by defendant.

73.

Plaintiff was entitled, under the contract, to an extension of time within which to perform the work more than [253] sufficient to enable it to complete the same and the denial by defendant of such extension and its assertion of the right to deduct $500.00 per day from and after May 24, 1936, until the work under the contract was completed was a material breach of said contract by defendant which entitled plaintiff to rescind said contract and recover from defendant the reasonable value of the work done and labor and materials furnished in the performance thereof.

74.

Said contract obligated defendant and its engineer to set for plaintiff sufficient points to line and grade to work to in constructing said tunnels. Plaintiff, on many occasions, demanded that said engineer set said points, but defendant and said engineer repeatedly refused to do so and never at any time during the construction of said tunnels set any points to line and grade to which plaintiff could work. In order to construct said tunnels plaintiff was at all times required to set the necessary points to line and grade to which to work. The

setting of said points to line and grade was necessary and essential to the construction of said tunnels and must necessarily be done before the excavation thereof could proceed. It was work which must be done before plaintiff could proceed with the excavation of said tunnels.

The promise and agreement of defendant to cause its engineer to set said lines and grades was a condition precedent to the performance by plaintiff of the work of excavating said tunnels and the failure and refusal of defendant to perform said promise and agreement was a continuing material breach of said contract which justified plaintiff in stopping work thereunder and in rescinding the same. The fact that plaintiff set said points to line and grade for constructing a [254] part of said tunnels did not relieve defendant of its obligation to set said points for the work remaining to be done when plaintiff rescinded said contract or waive the right of plaintiff to rescind said contract and refuse to proceed with the work on account of the refusal of defendant to set said points for the work then remaining to be done. At no time, either before or after receiving said notice of rescission, did defendant or its said engineering set, or offer to set, said points.

75.

Plaintiff, from the time of the execution of said contract until it rescinded same and stopped work thereunder, fully carried out and performed all the promises and obligations contained therein on its part to be performed.

76.

Plaintiff, at all times prosecuted the construction work under the contract with diligence and furnished and supplied for the performance of the work all necessary men, equipment, machinery and materials. Plaintiff adopted and used usual, approved and proper construction methods. It made as much progress in performing the construction work as was possible under the conditions encountered and performed the work which it did perform in constructing said tunnels in as short a time as was possible under such conditions. The failure to complete the construction work under said contract before June 4, 1936, was in no way due to any fault or negligence of plaintiff, but was due solely to causes over which it had no control and which unavoidably delayed the work, which causes have hereinbefore been specifically found as facts.

77.

The amount of money expended by plaintiff in perform- [255] ing work under the contract was $3,828,998.84, which sum was the reasonable cost of the work done by plaintiff prior to rescission by it of the contract. Defendant has paid to plaintiff $2,021,047.11 and no more.

Plaintiff is entitled to recover from defendant the difference between said reasonable cost of $3,-828,998.84 so expended by it and $2,021,047.11 paid to it by defendant, which difference is $1,807,951.73 plus a reasonable profit on the amount so expended

by plaintiff in the performance of the work which plaintiff did under said contract which the Court finds is 17-½ per centum of the amount so expended by plaintiff, or $670,074.80.

78.

The reasonable value of the work done by plaintiff was and is the amount of $4,499,073.64. [256]

Plaintiff and cross-defendants further move the Court to make the following conclusions of law.

Based upon the foregoing findings of fact the Court makes the following

CONCLUSIONS OF LAW

1.

That plaintiff was entitled under said contract to an extension of time of 498 days within which to complete the construction work thereunder.

2.

That defendant breached its contract with plaintiff in failing and refusing, prior to the expiration of the time stipulated in said contract for the performance of the construction work thereunder, to extend the time of plaintiff for the performance of said work.

3.

That defendant breached its said contract with the plaintiff in failing and refusing to pay the full amount of the installment payments due thereunder and in deducting from the installment payment due plaintiff on June 10, 1936, the amount of $3,500.00

being the amount of $500.00 per day as claimed damages for failure to complete the work in the stipulated time. That the total amount of said deductions, which were intended to be, and which would have been, deducted by defendant from installment payments thereafter to become due from defendant to plaintiff under said contract, if plaintiff had continued the work and completed said project would have been $112,000.00. Said breach was material and entitled plaintiff to rescind said contract.

4.

That immediately after the breach of said contract by defendant arising from said deduction of said amount from [257] the installment payment due plaintiff on June 10, 1936, plaintiff promptly and with due diligence rescinded said contract. That plaintiff did not waive its right to rescind said contract by laches, delay, or otherwise.

5.

That upon the rescission of said contract by plaintiff it became entitled to recover from defendant the reasonable value of the work done by plaintiff while performing said contract.

6.

That plaintiff made timely and proper applications for extensions of time as causes of delay entitling it to same arose, but same were denied by arbitrary and capricious conduct and decisions of

defendant and its engineer which amounted to fraud.

7.

That the work required to be done in constructing said tunnels was so radically different from the work described in said contract and was such a transformation therefrom and was so radically different from the work contemplated by the parties at the time said contract was entered into, that the minds of the parties never met on a contract for performing said work.

8.

That plaintiff and defendant both believed, at the time said contract was entered into that the tunnels described in same would be constructed through ground which, for nearly all of the length of said tunnels, would be self-supporting, and the work was designed in this belief and bid for by plaintiff in this belief and said contract was entered into under a mutual mistake of fact on the part of both parties which entitled plaintiff to rescind said contract. [258]

9.

That the representations and statements contained in the geological report and the plans and specifications furnished by defendant to plaintiff constituted a warranty as to the ground conditions to be encountered in constructing said tunnels and a warranty that for over 2,000 feet in each of said tunnels the ground would be self-supporting. That

plaintiff relied upon said warranty in entering into said contract. That said representations and statements were not true and the actual ground conditions encountered by plaintiff in constructing said tunnels were so materially different from those so represented by defendant that there was a breach of said warranty and the said warranty and the breach thereof constituted a fraud upon plaintiff which entitled it to rescind said contract.

10.

That defendant breached its said contract in failing and refusing to set sufficient points to line and grade to which plaintiff could work in constructing said tunnels. That the setting of said points was an obligation of defendant which was a condition precedent to the continuance by plaintiff of the work under said contract and the performance thereof. That said obligation was a continuing promise by defendant which it had a continual obligation to perform as the work was done. That the breach by defendant of said contract in refusing to set said points was material and entitled plaintiff to rescind said contract and that plaintiff did not waive its right to rescind said contract for said breach by delay, laches, or otherwise.

11.

That plaintiff is entitled to recover from defendant the reasonable value of the work and labor done and materials furnished by plaintiff to defendant in the performance of said [259] contract to June 13,

1936, less the amount defendant has paid to plaintiff, with interest on the amount unpaid from June 13, 1936, to the date of judgment, at the rate of 7% per annum.

The reasonable value of the work so performed and labor and materials so furnished was and is the amount of $4,499,073.64. Defendant has paid plaintiff the amount of $2,021,047.11 and no more, leaving a balance owing from defendant to plaintiff of $2,478,026.53.

12.

Plaintiff is entitled to judgment against defendant for said amount of $2,478,026.53 with interest thereon at the rate of 7% per annum from June 13, 1936, to the date of judgment, and its costs and disbursements herein incurred.

13.

Defendant is not entitled to recover any amount on its cross-complaint against plaintiff or against any of the cross-defendants.

14.

All of the cross-defendants are entitled to judgment that defendant take nothing by its cross-complaint and for their costs of suit incurred herein.

Let judgment be entered accordingly.

Dated: ....., 1938.

.....

Judge of the United States District Court.

[Endorsed]: Lodged Sept. 15, 1938. [260]

Cross-Defendants.

JUDGMENT

The above-entitled cause came on regularly for trial before the above-entitled Court, Honorable Michael J. Roche, Judge presiding, without a jury, the jury having been expressly waived by a written stipulation of all parties hereto heretofore filed in the above-entitled Court and Cause; said trial [261] began on the 12th day of April, 1938; plaintiff and cross defendant, Six Companies of California, appearing by its counsel, Messrs. Thelen & Marrin, DeLancey C. Smith, Eugene E. Trefethen and J. Paul St. Sure; and defendant and cross-complainant, Joint Highway District No. 13 of the State of California, appearing by its counsel, Archibald B. Tinning, Esq., and T. P. Wittschen, Esq., and cross-defendants Hartford Accident and Indemnity Company, a corporation, Fidelity and Deposit Company of Maryland, a corporation, The Aetna Casualty and Surety Company, a corporation, Indemnity Insurance Company of North America, a

corporation, American Surety Company of New York, a corporation, Maryland Casualty Company, a corporation, United States Fidelity and Guaranty Company, a corporation, The Fidelity and Casualty Company of New York, a corporation, Glens Falls Indemnity Company, a corporation, Standard Surety and Casualty Company of New York, a corporation, Standard Accident Insurance Company, a corporation, Massachusetts Bonding and Insurance Company, a corporation, Continental Casualty Company, a corporation, and New Amsterdam Casualty Company, a corporation, appearing by their counsel Messrs. Redman, Alexander & Bacon; upon motion of the defendant and cross-complainant, duly and regularly granted by order of the Court, the cause of action stated in the cross-complaint of defendant and cross-complainant, Joint Highway District No. 13 of the State of California, was dismissed as to cross-defendants, Fireman's Fund Indemnity Company, a California corporation, and Pacific Indemnity Company, a California corporation; and the court proceeded with the trial of said cause from day to day until concluded and testimony and exhibits were introduced on behalf of the parties to said action, and [262] at the conclusion of taking said testimony and offering of documents, the case was duly argued and submitted to the court for consideration and decision, and after due deliberation thereon, the court made its findings of fact and conclusions of law in writing thereon, which were duly filed herein, and directed the entry of judgment in accordance therewith.

Wherefore, by reason of the law and the findings aforesaid, It Is Hereby Ordered and Adjudged

1. That plaintiff take nothing by its said complaint on file herein, or by either count thereof;

2. That defendant and cross-complainant, Joint Highway District No. 13 of the State of California, a public corporation, do have and recover of and from plaintiff and cross-defendant Six Companies of California, a corporation, the sum of Three Hundred Nine Thousand Sixty-eight and 16/100 Dollars ($309,068.16).

3. That said defendant and cross-complainant Joint Highway District No. 13 of The State of California, a public corporation, do have and recover, jointly and severally, against said plaintiff Six Companies of California and against each of the respective Surety Company cross-defendants hereinafter named, the following percentages of said sum of Three Hundred Nine Thousand Sixty-eight and 16/100 Dollars ($309,068.16) as follows:

(a) Said defendant do have and recover, jointly and severally, against said plaintiff Six Companies of California, a corporation, and against cross-defendant Hartford Accident and Indemnity Company, a Connecticut corporation, ten (10) per centum of said sum, to wit, the sum of Thirty Thousand Nine Hundred Six and 81/100 Dollars ($30,906.81);

(b) Said defendant do have and recover, jointly and severally, against said plaintiff Six Companies of California, a corporation, and against cross-

defendant Fidelity and Deposit Company of Maryland, a Maryland corporation, ten (10) per centum [263] of said sum, to wit, the sum of Thirty Thousand Nine Hundred Six and 81/100 Dollars ($30,906.81);

(c) Said defendant do have and recover, jointly and severally, against said plaintiff Six Companies of California, a corporation, and against cross-defendant The Aetna Casualty and Surety Company, a Connecticut corporation, ten (10) per centum of said sum, to wit, the sum of Thirty Thousand Nine Hundred Six and 81/100 Dollars ($30,906.81);

(d) Said defendant do have and recover, jointly and severally, against said plaintiff Six Companies of California, a corporation, and against cross-defendant Indemnity Insurance Company of North America, a Pennsylvania corporation, ten (10 per centum of said sum, to wit, the sum of Thirty Thousand Nine Hundred Six and 81/100 Dollars ($30,906.81);

(e) Said defendant do have and recover, jointly and severally, against said plaintiff Six Companies of California, a corporation, and against cross-defendant American Surety Company of New York, a New York corporation, ten (10) per centum of said sum, to wit, the sum of Thirty Thousand Nine Hundred Six and 81/100 Dollars ($30,906.81);

(f) Said defendant do have and recover, jointly and severally, against said plaintiff Six Companies of California, a corporation, and against cross-

defendant Maryland Casulty Company, a Maryland corporation, six and one-half (6½) per centum of said sum, to wit, the sum of Twenty Thousand Eighty-nine and 43/100 Dollars ($20,089.43);

(g) Said defendant do have and recover, jointly and severally, against said plaintiff Six Companies of California, a corporation, and against cross-defendant United States Fidelity and Guaranty Company, a Maryland corporation six and one-half (6½) per centum of said sum, to wit, the sum of Twenty Thousand Eighty-nine and 43/100 Dollars ($20,089.43); [264]

(h) Said defendant do have and recover, jointly and severally, against said plaintiff Six Companies of California, a corporation, and against cross-defendant The Fidelity and Casualty Company of New York, a New York corporation, five (5) per centum of said sum, to wit, the sum of Fifteen Thousand Four Hundred and Fifty-three and 40/100 Dollars ($15,453.40);

(i) Said defendant do have and recover, jointly and severally, against said plaintiff Six Companies of California, a corporation, and against cross-defendant Glens Falls Indemnity Company, a New York corporation, four and one-half (4½) per centum of said sum, to wit, the sum of Thirteen Thousand Nine Hundred Eight and 06/100 Dollars ($13,908.06);

(j) Said defendant do have and recover, jointly and severally, against said plaintiff Six Companies of California, a corporation, and against cross-

defendant Standard Surety and Casualty Company of New York, a New York corporation, four (4) per centum of said sum, to wit, the sum of Twelve Thousand Three Hundred Sixty-two and 72/100 Dollars ($12,362.72);

(k) Said defendant do have and recover, jointly and severally, against said plaintiff Six Companies of California, a corporation, and against cross-defendant Standard Accident and Insurance Company, a Michigan corporation, four (4) per centum of said sum, to wit, the sum of Twelve Thousand Three Hundred Sixty-two and 72/100 Dollars ($12,362.72);

(l) Said defendant do have and recover, jointly and severally, against said plaintiff Six Companies of California, a corporation, and against cross-defendant Massachusetts Bonding and Insurance Company, a Massachusetts corporation, four (4) per centum of said sum, to wit, the sum of Twelve Thousand Three Hundred Sixty-two and 72/100 Dollars ($12,362.72);

(m) Said defendant do have and recover, jointly and severally, against said plaintiff Six Companies of California, [265] a corporation, and against cross-defendant Continental Casualty Company, an Indiana corporation, two and one-half (2½) per centum of said sum, to wit, the sum of Seven Thousand Seven Hundred Twenty-six and 70/100 Dollars ($7,726.70);

(n) Said defendant do have and recover, jointly and severally against said plaintiff Six Companies

of California, a corporation, and against cross-defendant New Amsterdam Casualty Company, a New York corporation, two (2) per centum of said sum, to wit, the sum of Six Thousand One Hundred Eighty-one and 36/100 Dollars ($6,181.36);

4. That defendant and cross-complainant Joint Highway District No. 13 of the State of California, do have and recover from plaintiff and each of the cross-defendants hereinbefore named its costs of suit incurred herein taxed at the sum of Eight Hundred Seventy-two and 70/100 Dollars ($872.70).

Judgment entered September 27, 1938.

[Title of District Court and Cause.]

SUPERSEDEAS BOND ON APPEAL.

[277]

Know All Men By These Presents:

That we, Six Companies of California, a Nevada corporation, as principal, and Henry J. Kaiser Company, a Nevada corporation, The Utah Construction Company, a Utah corporation, MacDonald & Kahn Co., Ltd., a Delaware corporation, J. F. Shea Co., Inc., a Delaware corporation, Morrison-Knudsen Company, Inc., a Delaware corporation, S. D. Bechtel, an individual, K. K. Bechtel, an individual, and W. A. Bechtel, Jr., an individual, as sureties, acknowledge ourselves to be indebted to Joint Highway District No. 13 of the State of

California, a public corporation of the State of California, in the sum of Three Hundred and Sixty Thousand and no/100 Dollars ($360,000.00), lawful money of the United States of America, for the payment whereof well and truly to be made, we hereby bind ourselves, our heirs, administrators, successors and assigns, firmly by these presents as follows:

The principal and Henry J. Kaiser Company, a Nevada corporation, as surety, jointly and severally in a sum equal to one-sixth of the total amount of this bond, but in no event shall the aggregate liability of Henry J. Kaiser Company hereunder exceed the amount of Sixty Thousand and no/100 Dollars ($60,000.00);

The principal and The Utah Construction Company, a Utah corporation, as surety, jointly and severally in a sum equal to one-sixth of the total amount of this bond, but in no event shall the aggregate liability of The Utah Construction Company hereunder exceed the amount of Sixty Thousand and no/100 Dollars ($60,0000.00);

The principal and MacDonald & Kahn Co., Ltd., a Delaware corporation, as surety, jointly and severally in a sum equal to one-sixth of the total amount of this bond, but in no event shall the aggregate liability of MacDonald & [278] Kahn Co., Ltd., hereunder exceed the amount of Sixty Thousand and no/100 Dollars ($60,000.00);

The principal and J. F. Shea Co., Inc., a Delaware corporation, as surety, jointly and severally

in a sum equal to one-sixth of the total amount of this bond, but in no event shall the aggregate liability of J. F. Shea Co., Inc., hereunder exceed the amount of Sixty Thousand and no/100 Dollars ($60,000.00);

The principal and Morrison-Knudsen Company, Inc., a Delaware corporation, as surety, jointly and severally in a sum equal to one-sixth of the total amount of this bond, but in no event shall the aggregate liability of Morrison-Knudsen Company, Inc., hereunder exceed the amount of Sixty Thousand and no/100 Dollars ($60,000.00);

The principal and S. D. Bechtel, K. K. Bechtel and W. A. Bechtel, Jr., as sureties, jointly and severally in a sum equal to one-sixth of the total amount of this bond, but in no event shall the aggregate liability of S. D. Bechtel, K. K. Bechtel and W. A. Bechtel, Jr., hereunder exceed the amount of Sixty Thousand and no/100 Dollars ($60,000.00).

The condition of the foregoing obligation is such that:

Whereas, on the 27th day of September, 1938, in the District Court of the United States of the Northern District of California, Southern Division, in a suit depending in that court wherein Six Companies of California was plaintiff and cross-defendant and Joint Highway District No. 13 of the State of California was defendant and cross-complainant and Six Companies of California and Hartford Accident and Indemnity Company, a Connecticut

corporation; Fidelity and Deposit Company of Maryland, a Maryland corporation; The Aetna Casualty and Surety Company, a Connecticut corporation; Indemnity Insurance [279] Company of North America, a Pennsylvania corporation; American Surety Company of New York, a New York corporation; Maryland Casualty Company, a Maryland corporation; United States Fidelity and Guaranty Company, a Maryland corporation; The Fidelity and Casualty Company of New York, a New York corporation; Glens Falls Indemnity Company, a New York corporation; Standard Surety and Casualty Company of New York, a New York corporation; Standard Accident Insurance Company, a Michigan corporation; Massachusetts Bonding and Insurance Company, a Massachusetts corporation; Continental Casualty Company, an Indiana corporation; and New Amsterdam Casualty Company, a New York corporation, were cross-defendants, numbered on the Civil Docket as 20101-R, a judgment was rendered in favor of said defendant and against said plaintiff on the complaint and in favor of said defendant and cross-complainant and against said plaintiff and cross-defendants on the cross-complaint, and the said plaintiff and cross-defendants having filed or being about to file in the office of the Clerk of said District Court a Notice of Appeal to the United States Circuit Court of Appeals for the Ninth Circuit to be holden in the City and County of San Francisco, State of California.

Now, the condition of the above obligation is such that if the said plaintiff and cross-defendants shall prosecute their appeals to effect and satisfy the said judgment in full, together with costs, interest and damages for delay if for any reason said appeals are dismissed, or if the judgments are affirmed, and satisfy in full such modification of the judgments and such costs, interest and damages as the Appellate [280] Court may adjudge and award, then the above obligation is void else to remain in full force and effect.

In Witness Whereof, the undersigned have executed this bond this 7th day of November, 1938.

STIPULATION DESIGNATING THE PARTS OF THE RECORD, PROCEEDINGS AND EVIDENCE TO BE INCLUDED IN THE RECORD ON APPEAL

It is hereby stipulated by and between the parties to the above entitled action that there shall be included in the record on the appeal by appellants to the United States Circuit Court of Appeals for the Ninth Circuit from the judgment of the United States District Court in said action the following:

1. Complaint.
2. Answer and cross-complaint.
3. Answer of plaintiff and cross-defendants to cross-complaint. [338]

4. Answer of all cross-defendants other than plaintiff to cross-complaint.

5. Stipulation waiving trial by jury.

6. Amendment to complaint.

7. Amendment to plaintiff's answer to cross-complaint.

8. Amendment to cross-defendants' answer, other than plaintiff, to cross-complainant.

9. Reporter's transcript of evidence and proceedings at the trial.

10. All of the exhibits introduced by plaintiff in evidence at the trial, being exhibits Nos. 1 to 100, both inclusive.

11. All of the exhibits introduced by defendant in evidence at the trial, being exhibits lettered and numbered A to X-116, both inclusive.

12. Motion of defendant for judgment on the complaint and for special findings of fact and conclusions of law as same appears in the reporter's transcript of proceedings at the trial.

13. Motion of plaintiff for judgment on the complaint and for special findings of fact and conclusions of law as the same appears in the reporter's transcript of the proceedings at the trial.

14. Clerk's minute order of May 27, 1938, made in this case (Minute Book 51, p. 565).

15. Order granting motion for judgment on complaint in favor of defendant.

16. Clerk's minute order of May 31, 1938, made in this case (Minute Book 51, p. 568, et seq.).

17. Motion by cross-defendants to dismiss cross-complaint as same appears in the reporter's transcript of proceedings at the trial.

18. Order denying motion to dismiss cross-complaint.

19. Order granting motion to dismiss cross-complaint as to cross-defendants Fireman's Fund Indemnity Company and Pacific Indemnity Company.

20. Clerk's minute order of June 1, 1938, made in this case (Minute Book 51, p. 570).

21. Order granting motion to amend cross-complaint on face.

22. Dismissal of cross-complaint as to Fireman's Fund Indemnity Company and Pacific Indemnity Company. [339]

23. Motion of plaintiff for judgment and special findings of fact and conclusions of law on cross-complaint as same appears in the reporter's transcript of proceedings at the trial.

24. Motion of plaintiff for judgment and special findings of fact and conclusions of law on counter claims as same appears in the reporter's transcript of proceedings at the trial.

25. Motion of cross-defendants other than plaintiff for judgment and special findings of fact and conclusions of law on cross-complaint as same appears in the reporter's transcript of proceedings at the trial.

26. Motion of defendant for judgment and special findings of fact and conclusions of law on cross-

complaint as same appears in the reporter's transcript of proceedings at the trial.

27. Clerk's minute order of June 2, 1938, made in this case (Minute Book 51, p. 571, et. seq.).

28. Stipulation and order for amending answer and cross-complaint.

29. Clerk's minute order of August 8, 1938, made in this case (Minute Book 51, p. 655).

30. Opinion of the Judge of the District Court.

31. Defendant's requested findings of fact and conclusions of law.

32. Stipulation and order extending time of plaintiff and cross-defendants to submit findings of fact and conclusions of law and proposed amendments to defendant's requested findings of fact and conclusions of law.

33. Plaintiff's and cross-defendant's objections and amendments to defendant's requested findings of fact and conclusions of law and plaintiff's and cross-defendant's requested findings of fact and conclusions of law.

34. Findings of fact and conclusions of law. This is the same document described under 31 hereinabove.

35. Judgment.

36. Notice of entry of judgment prepared and served by the Clerk on September 27, 1938, and proof of service. [340]

37. Defendant and cross-complainant's notice of entry of judgment and proof of service, filed on or about September 30, 1938.

38. Notice of appeal dated November 25, 1938, and filed November 25, 1938.

39. Clerk's notice that notice of appeal was filed by plaintiff and cross-defendants on November 25, 1938, dated same date.

40. Supersedeas bond.

41. Appellant's designation of contents of record on appeal.

42. Stipulation that District Court may order all original papers and exhibits sent to the United States Circuit Court of Appeals for the Ninth Circuit.

43. Order of District Court that all original papers and exhibits be sent to the United States Circuit Court of Appeals for the Ninth Circuit.

44. Stipulation that District Court may extend time for filing and docketing record on appeal with the United States Circuit Court of Appeals for the Ninth Circuit to and including February 21, 1939.

45. Order of District Court extending time for filing and docketing record on appeal with the United States Circuit Court of Appeals for the Ninth Circuit to and including February 21, 1939.

46. Stipulation for correction of errors in reporter's transcript and order of Court directing such correction of errors.

47. This stipulation as to contents of record on appeal.

48. Clerk's certificate.

It is hereby stipulated that the record on appeal prepared in accordance with this stipulation will be

a full and complete record of all of the proceedings and evidence in the above entitled action and that such record shall constitute full and complete compliance with the law and the rules of Civil Procedure of the District Courts of the United States, and the Clerk of this Court is hereby requested to prepare, certify and transmit to and file in the United States Circuit Court of Appeals for the Ninth [341] Circuit a transcript of record in this cause in accordance with this stipulation.

CERTIFICATE OF CLERK TO TRANSCRIPT OF RECORD ON APPEAL.

I, Walter B. Maling, Clerk of the United States District Court, for the Northern District of California, do hereby certify that the foregoing 342 pages, numbered from 1 to 342, inclusive, and Volume II, with pages numbered from 1 to 1879, inclusive, contain a full, true, and correct transcript of the records and proceedings in the case of Six Companies of California, a corporation, et al., vs. Joint Highway District No. 13 of the State of California, a public corporation, No. 20101-R, as the same now remain on file and of record in my office.

I further certify that the cost of preparing and certifying the foregoing transcript of record on appeal is the sum of $47.75, and that the said amount has been paid to me by the Attorneys for the appellants herein.

In Witness Whereof, I have hereunto set my hand and affixed the seal of said District Court, this 7th day of February A. D. 1939.

[Seal] WALTER B. MANNING,
Clerk.

B. E. O'HARA,
Deputy Clerk. [343]

In the United States Circuit Court of Appeals for the Ninth Circuit

Civil Action,

File Number 9113

SIX COMPANIES OF CALIFORNIA, a corporation, et al.,

Appellants,

vs.

JOINT HIGHWAY DISTRICT NO. 13 OF THE STATE OF CALIFORNIA, a public corporation,

Appellee.

APPELLANTS' CONCISE STATEMENT OF POINTS ON WHICH THEY INTEND TO RELY ON APPEAL AND DESIGNATION OF PARTS OF RECORD APPELLANTS THINK NECESSARY FOR THE CONSIDERATION OF SUCH POINTS.

Pursuant to the provisions of paragraph 6 of Rule 19 of the Rules of this court, appellants above named file this as a concise statement of the points on which they and each of them intend to rely on this appeal, and designate the following mentioned parts of the record which appellants think are necessary for the consideration of such points.

1. The District Court erred in ruling that plaintiff was not entitled to rescind the contract between plaintiff and defendant upon the ground

that plaintiff was entitled to an extension of time within which to perform the contract, and the denial of such extension by defendant, and the deduction of a penalty of Five Hundred Dollars ($500) per day commencing with the 25th day of May, 1936, deprived plaintiff of money which it was entitled to receive under the contract, and failure to pay same constituted a breach of said contract, giving plaintiff a right to rescind same.

2. The District Court erred in ruling that plaintiff was not entitled to an extension of time within which to complete the work under the contract for the reason that unavoidable delay was caused in the performance of the contract over which the plaintiff had no control. This unavoidable delay entitled plaintiff to an extension of time beyond the 720 days provided in the contract for performance of same for not less than 300 days additional within which to complete the work; and was caused by

(a) Slides in the excavation outside of the West Portal;

(b) Unstable ground conditions and other difficulties in excavating the West Portal section of the tunnels;

(c) Difficulty in placing concrete lining under instructions of the Engineer of defendant in the West Portal sections;

(d) Treacherous and unstable ground conditions requiring stoppage of excavation in August, 1935;

(e) Falling in of portion of excavated section of tunnel on August 28, 1935, and stoppage of work under orders of the Industrial Accident Commission of the State of California as a result of same;

(f) Falling in of portion of excavated section of tunnels on February 22, 1936, and orders of the Industrial Accident Commission of the State of California resulting therefrom which stopped work;

(g) Ground conditions encountered throughout progress of the excavation which required artificial support of same, and increased work over amount necessary to be done in the event ground had been self-supporting;

(h) Stormy and inclement weather.

3. The District Court erred in ruling that plaintiff was not entitled as a matter of right to an extension of time under the provisions of the contract for delays caused in the performance of the work by stormy or inclement weather.

4. The District Court erred in ruling that plaintiff was not entitled to an extension of time for unavoidable delays, as set forth above in paragraph 2 of these points, in performance of the contract which obligated the defendant to grant plaintiff an extension of time for same.

5. The District Court erred in refusing to rule that the action of the Board of Directors of defendant in refusing to extend the time of plaintiff

within which to perform the work under said contract between plaintiff and defendant was arbitrary, capricious, fraudulent and void and that notwithstanding said refusal plaintiff was entitled to an extension of time for the reasons set forth under point 2 hereof sufficient to enable it to complete all the work under said contract.

6. The District Court erred in refusing to rule that the action of the District Engineer of defendant in failing to certify to the Board of Directors of defendant that, in his judgment, there were reasons which had unavoidably delayed the work of plaintiff under said contract between plaintiff and defendant and in stating to said Board that there were no such reasons, and his said actions were known by the Board of Directors of defendant to be so arbitrary, capricious and grossly mistaken as to amount to fraud and amounted to a complete failure of said Engineer to carry out and perform his duties under said contract to exercise a fair and impartial judgment in said matter.

7. The District Court erred in ruling that plaintiff did not have the right to rescind the contract between plaintiff and defendant because of the misrepresentation by defendant to plaintiff, prior to the execution of the contract between plaintiff and defendant, of the ground conditions through which the tunnels to be constructed under said contract were to be driven and by which misrepresentations defendant represented to plaintiff that said ground

conditions would be much more favorable for the construction of said tunnels than they actually were. The District Court erred in ruling that said misrepresentations did not amount to fraud on the part of defendant which induced plaintiff to enter into said contract and in ruling that plaintiff did not have the right to rescind said contract because of said misrepresentations.

8. The District Court erred in ruling that said contract between plaintiff and defendant was not entered into under a mutual mistake of fact as to the condition of the ground through which the tunnels to be constructed under said contract were to be driven which was so material that plaintiff had the right to rescind said contract.

9. The District Court erred in ruling that plaintiff waived its right to rescind said contract because of the failure of defendant to make the progress payments provided therein to be made.

10. The District Court erred in ruling that plaintiff waived its right to rescind said contract because of the misrepresentations by defendant as to the ground conditions through which the tunnels provided in said contract to be constructed were to be driven.

11. The District Court erred in ruling that plaintiff waived its right to rescind said contract because the same was entered into under a mutual mistake of fact as to the ground conditions through which the tunnels to be constructed under said

contract were to be driven.

12. The District Court erred in ruling that, under said contract between plaintiff and defendant, plaintiff was not entitled as of right to an extension of time within which to complete the work under said contract.

13. The District Court erred in refusing to rule that defendant breached its said contract with plaintiff by failing to cause its engineer to set sufficient points to line and grade for plaintiff to work to in performing the work under said contract and in refusing to rule that because of said breach plaintiff was entitled to rescind said contract.

14. The District Court erred in ruling that plaintiff did not have a right to rescind the contract for the failure and refusal of defendant to make the progress payments to plaintiff under said contract when and as due and because defendant asserted and exercised the alleged right to deduct agreed or liquidated damages from such payments for the following reasons:

Defendant, by the geological report, contract, plans and specifications and by exhibiting to plaintiff test drifts and test pits, represented to plaintiff and warranted to plaintiff, that the ground through which the tunnels were to be constructed would, for the most part, be self-supporting, that only temporary removable timber, if any, would be required and that methods of construction could be employed suitable to self-supporting ground and

which would enable plaintiff to complete the work within 720 days after the execution of the contract.

Said representations were false and untrue. They misled plaintiff as to the methods and procedure which could be employed in performing the work of excavating the tunnels and resulted in serious delay to the work.

Defendant further delayed the work by ordering parts of it to be stopped or delayed and by the refusal of defendant and its Engineer to cooperate on a practical plan for proceeding with the work after the cave-in of August 28, 1935.

Defendant, by its own fault and through its own actions, having delayed the work, waived the provisions of the contract stipulating the time for completion thereof and all right to recover any agreed or liquidated damages for delay or to deduct the same from any progress payments due plaintiff and the deduction by defendant of any amounts from progress payments due plaintiff was wrongful and gave plaintiff the right to rescind the contract.

15. The District Court erred in striking out as evidence the geological report offered in evidence by plaintiff (Plaintiff's Exhibit 22). The defendant published notice inviting bids for the construction of its project, and invited and required the attention of prospective bidders to the specifications and plans on file with the District. These specifications in Section 32 under the heading of Tunnel Construction, by subsection 4 thereof, di-

rected attention of bidders to a geological report on the geological structures through which the tunnels would pass on file in the office of the District Engineer. Pursuant to this clause in the specifications, plaintiff examined this report and took a copy of same for use in connection with planning its bid on the work to be done in performance thereof if its bid was accepted. The undisputed testimony is that the plaintiff relied on the contents of this report in making its bid, and in forming its plans for the doing of the work, and in carrying out the work, until it was found that said report was erroneous.

The report was clearly admissible for the purpose of showing the proper reliance of plaintiff on the contents of same, and to establish that delay caused by the difference in the ground conditions met with from those predicted in the report was unavoidable to plaintiff and was competent, relevant and material evidence on the issues of fraud, mistake and the right of plaintiff to an extension of time.

16. The District Court erred in striking out as evidence the tracing made by the witness Calhoun of a profile map contained in Exhibit 22 offered by plaintiff and stricken out by the court (Plaintiff's Exhibit 23). This exhibit was offered by plaintiff through the witness Calhoun to show that when the witness examined the geological report at the office of the District Engineer he made a tracing, or exact copy, of a map contained in the report showing the

section of the work included in the tunnels, and that this tracing was later used by the plaintiff in connection with the geology report in making its bid and planning the doing of the work. It was admissible on the same ground as Exhibit 22 was admissible, and for the same reasons.

17. The District Court erred in granting the motion made by defendant to strike from the record exhibits 22 and 23 and certain evidence in connection therewith.

18. The District Court erred in the admission in evidence of defendant's Exhibit "F", which was a letter dated April 19, 1935, from C. H. Fry, Superintendent of Safety of the Industrial Accident Commission of the State of California to T. M. Price, Project Manager of the plaintiff, to which was attached a memorandum dated April 15, 1935, from F. L. Lowell to C. H. Fry. The letter purports to recite certain conversations said to have occurred before the plaintiff bid on the doing of the work involved in this case between C. H. Fry and Mr. Larson and Mr. Fontaine, and was not admissible because it was clearly hearsay and in no way binding upon the plaintiff, and because the parties to the alleged conversation mentioned in the letter were not called as witnesses to establish same.

19. The District Court erred in admitting as evidence defendant's Exhibit "WWW", being a letter dated March 4, 1936, from C. H. Sweetser, District Engineer of the United States Department

of Agriculture, to the District Engineer of defendant, with which letter was inclosed a memorandum dated February 4, 1936, from Thomas H. MacDonald, Chief of the Bureau of Public Roads of the United States Department of Agriculture to district engineers of the same department, which in turn transmitted and inclosed a copy of Administrative Order No. 54 (Supplement 1) of Federal Emergency Administration of Public Works, dated August 29, 1935, signed by Horatio B. Hackett, Assistant Administrator. The letter and the inclosures were clearly inadmissible. Same were offered through plaintiff's witness S. D. Bechtel on cross-examination and were inadmissible as not proper cross-examination, and as not binding on the plaintiff in any manner, and hearsay, and for other objections urged at the time.

20. The District Court erred in admitting into evidence as defendant's Exhibit "O-4" a copy of a grant agreement dated March 9, 1934, between defendant and the United States of America by which certain money was provided to be granted to the defendant district, but to which agreement the only parties were the defendant and the United States. This agreement was inadmissible because plaintiff was not a party to it, and had never seen it, and same was not binding on it, and it was incompetent, irrelevant, and immaterial, and was inadmissible for all the reasons given at the trial.

21. The District Court erred in the admission of

Exhibits "X-1 to X-116", inclusive, which were offered by the defendant as cross-complainant in support of the allegations of its cross-complaint. Each of same was inadmissible for the reason that the cross-complaint did not state a cause of action against the cross-defendants, and was prematurely filed, and all of the offered exhibits were inadmissible for these reasons.

22. The District Court erred in admitting in evidence, over the objection of plaintiff and cross-defendants, any evidence on the cross-complaint for the following reasons:

(1) The Court had no jurisdiction of the cross-complaint because at the time it was filed two of the cross-defendants were citizens of the same State as the cross-complainant.

(2) The cross-complaint does not state a cause of action because it is based on an alleged right to recover damages for abandonment of the work and such alleged right is based on, and governed by, the provisions of paragraph 5 of the contract and Section 6 (q) of the specifications and the cross-complaint shows on its face that the cross-complainant did not perform the conditions in said provisions of said contract which it was required to perform in order to maintain said action.

(3) The cross-complaint was prematurely filed and should have been dismissed on the motion of cross-defendants because it shows on its face that cross-complainant did not, prior to filing the same,

perform the conditions which it was required to perform under paragraph 5 of the contract and Section 6 (q) of the specifications prior to the commencement of any action based on an alleged abandonment by plaintiff of the work under the contract.

23. The District Court erred in admitting in evidence, over the objection of plaintiff and cross-defendants any evidence on the cross-complaint relating to agreed or liquidated damages for the further reason that the cross-complaint was based on an alleged cause of action for abandonment by plaintiff of the work and the contract properly construed, and particularly paragraph 5 thereof and Section 6 (q) of the specifications, defines and limits the damages in such case to the excess, if any, of the cost of completing the work over the contract price for completion thereof and does not provide for the payment, or recovery of any agreed or liquidated damages for delay.

24. The District Court erred in denying the motion of plaintiff and cross-defendants (Tr. pp. 1707 to 1709) to strike from the record the evidence referred to in said motion upon the grounds and for the reasons stated therein.

25. The District Court erred in making its findings of fact and conclusions of law in that it failed to find the facts specially and failed to discharge its duty to appropriately and specifically determine all of the issues of fact in the case, and the findings

of fact as drawn and signed by the court did not formulate and state the underlying facts in the case; further, the findings of fact as filed by the court were not made by the court, but were adopted by the court from findings prepared by counsel for the defendant; and the same are a partisan and unfair statement of conclusions, and not a finding of the underlying facts. Further, the court was obligated to make the findings itself and not through counsel.

26. The District Court erred in ruling that the plaintiff abandoned the contract between plaintiff and defendant, and the work to be done under the contract. This ruling is contained throughout the findings made by the court and contrary to the rulings requested of the court in the findings of fact requested by the plaintiff. It is erroneous in that the facts correctly found show that defendant improperly, and unjustly, and without legal right or authority deducted a penalty from money due plaintiff under the terms of the contract in a payment tendered to plaintiff by defendant on June 10, 1936, for work done during the month of May, 1936, by which tendered payment a penalty of $500 per day for May 25th to May 31st, inclusive, was deducted from the amount admittedly otherwise due plaintiff under the contract; and this payment having been tendered under a certificate by the District Engineer of defendant, same amounted to an irrevocable declaration by defendant that it would

continue to deduct $500 per day from the payments due plaintiff under the contract until the date when plaintiff actually completed the work, as defendant at the time well knew plaintiff would not actually complete the work until approximately the 3rd day of January, 1937, so that the deduction of $500 per day would result in a total deduction from money due plaintiff under the contract of $112,000. This constituted a breach of contract by the defendant, giving plaintiff the right to rescind the contract and stop work thereunder, and bring an action for the recovery of the reasonable value of the work done by plaintiff up to the time of such breach. The penalty was improperly deducted because plaintiff was entitled to an extension of time until a date well past the date when it was anticipated plaintiff would complete its work under the contract; and the ruling of the District Court was contrary to the facts and the law.

27. The District Court erred in ruling that the contract between plaintiff and defendant was executed on June 4, 1934, and the uncontradicted evidence shows that it was not executed by defendant until June 14, 1934.

28. The District Court erred in ruling that the contract provided that the work thereunder should be completed within 720 days after its execution. The contract provided that there should be added to the period of 720 days from the date of the execution of the contract by the Board of Directors of defendant the time during which the plaintiff was

delayed in the work by acts of God, or by stormy and inclement weather or by any reason which in the judgment of the District Engineer, unavoidably delayed the work. The work was unavoidably delayed for the times and on account of the causes set forth in point 2 hereinabove and under the terms of the contract such additional time was required to be added to said period of 720 days.

29. The District Court erred in ruling that defendant was ready, able, and willing to submit the right of the defendant to deduct $3,500.00 penalty for the month of May, 1936, from the amount delivered plaintiff on June 10, 1936, for work done during that month to the District Engineer for determination after that date. This ruling is found in subparagraph (1) of finding of fact XIV and elsewhere in the findings made by the court, and is erroneous in that the District Engineer had already deducted the penalty, made his decision and certified the amount due plaintiff to defendant, and no longer had any power to act in connection with the matter, as the contract by its terms provided that no extension of time could be given to the plaintiff to perform same after the expiration of the time originally fixed in the contract for its completion, but such extension must be given prior to that date.

30. The District Court erred in ruling that plaintiff was requested by the District Engineer to specify reasons for its request, dated June 10, 1935, for extension of time to complete the contract.

This ruling is contrary to the uncontradicted evidence and is found in sub-paragraph 2 of finding of fact XIV, and is erroneous as there is no evidence whatever in the record to support it and because the overwhelming weight of the evidence is that the District Engineer advised plaintiff, prior to the 10th day of June, 1935, that it was entitled to an extension of time and the request for such extension made on that date was based upon such advice.

31. The District Court erred in ruling that plaintiff knew on May 14th, 1936, its request for extension of time, dated May 8, 1936, would be denied. This ruling is made in sub-paragraph 2 and 3 of finding of fact XIV and elsewhere in the findings made and adopted by the court, and is erroneous in that it is absolutely contrary to the uncontradicted evidence, which was that if defendant denied such request it would be without intention on the part of defendant to deduct any penalty from the amount of money due plaintiff under the contract.

32. The District Court erred in ruling that plaintiff did not comply with any request made by the District Engineer for itemization of its claims for unavoidable delays. This ruling was made in sub-paragraph 4 of finding of fact XIV and elsewhere in the findings made and adopted by the court. It was erroneous in that the uncontradicted evidence showed that plaintiff was requested by

the Engineer in January, 1936, and later in April, 1936, to refrain from presenting a detailed request for an extension of time, which request was followed upon the further representation and statement by the District Engineer that a sufficient time to enable the plaintiff to complete the work without a deduction of penalty from payments due it would be granted.

It is further erroneous in that the evidence is conclusive that plaintiff submitted to defendant in writing detailed statements of the causes which delayed the work and that these were discussed orally with the District Engineer many times and that he was thoroughly familiar with them. The evidence is also conclusive that at no time between the date of filing by plaintiff of a request for an extension of time and the denial thereof did defendant or the District Engineer request plaintiff to specify or itemize the reasons for the request.

It was further erroneous in that there is no evidence to support the finding that the defendant acted in good faith in denying an extension of time to plaintiff. On the other hand, the evidence shows conclusively that defendant denied such requested extension without a hearing, without any request to plaintiff to submit reasons for the requested extension, and with knowledge on the part of defendant and its Engineer that the work had been unavoidably delayed and the reasons therefor. Furthermore, the evidence is uncontradicted that plaintiff was

advised by defendant before the last application for an extension was made, and before it could possibly have been considered by the District Engineer, that it would be denied, if made.

33. The District Court erred in ruling that the contractor was not delayed in the work, and that any delays that occurred were because of the methods of work adpted by plaintiff. This ruling is contained in sub-paragraph 5 of finding of fact XIV and elsewhere in the findings made and adopted by the court, and is erroneous in that it is contrary to the overwhelming weight of the evidence.

34. The District Court erred in ruling that the defendant and its Engineer acted fairly and honestly in passing upon the question of whether the contractor had been delayed in the performance of same by act of God, by stormy or inclement weather, or by any reason which in the judgment of the District Engineer unavoidably delayed the work. This ruling was made in sub-paragraph 5 of finding of fact XIV and elsewhere in the findings made and adopted by the court, and was erroneous in that the overwhelming weight of the evidence showed that the District and its Engineer acted arbitrarily, capriciously, fraudulently, unfairly and contrary to the facts and express statements made by them in connection with the subject.

35. The District Court erred in ruling that the contract provided that plaintiff was obligated to perform the work covered by same within the time

and price fixed in the contract regardless of conditions which might be encountered; and that plaintiff knew the underground conditions which were encountered before the 1st of January, 1935. This ruling was made by the court in sub-paragraph 6 of finding of fact XIV, and elsewhere in the findings made and adopted by the court, and was erroneous in that same was absolutely contrary to the uncontradicted evidence presented at the trial; and is contrary to the predictions contained in the geological report and the contract, plans and specifications under which the work was bid upon and performed by plaintiff.

The statement in finding XIV, sub-paragraph (6), that the underground conditions were known to plaintiff prior to January 1, 1935, is not supported by any evidence in the record. The evidence is uncontradicted that on said date plaintiff had excavated only about 100 feet of tunnels, each of which was approximately 2900 feet long, and that the ground conditions in the unexcavated portions of the tunnels were absolutely unknown to plaintiff.

The statement that plaintiff, with full knowledge of ground conditions from almost the inception of the contract, continued with the work for more than one year without making any complaint that underground conditions were different from those anticipated is not supported by any evidence in the record. The uncontradicted evidence is that plaintiff did not acquire any true knowledge of ground con-

ditions except during the course of the excavation and that at the expiration of a year after the date of the contract only a few hundred feet had been excavated in each tunnel. The evidence is further uncontradicted that prior to the expiration of a year after the contract was made plaintiff complained of the difference in the ground conditions.

The statement in this finding that defendant at no time made any misrepresentations to plaintiff is contrary to the evidence, which is conclusive that, prior to the submission of the bid by plaintiff, defendant furnished plaintiff with a geological report which misstated the ground conditions through which the tunnels were to be driven. Furthermore, the provisions of the plans and specifications relating to the construction of the tunnels were deceptive and misleading.

36. The District Court erred in ruling that the defendant furnished to plaintiff all the engineering work provided to be furnished in the contract between the parties. This ruling is contained in sub-paragraph 7 of finding of fact XIV, and elsewhere in the findings made and adopted by the court, and is erroneous in that the contract provided and the evidence showed such provision intended defendant was required to furnish to plaintiff lines and grades to work to, and that this was not done by defendant.

37. The District Court erred in ruling that plaintiff did not request the District Engineer to

pass upon the questions or matters stated in the notice of rescission served by plaintiff upon defendant. This ruling was made in sub-paragraph 8 of finding of fact XIV, and elsewhere in the findings made and adopted by the court, and is erroneous in that the overwhelming weight of the evidence showed that plaintiff repeatedly requested the District Engineer to pass upon all of the matters involved, and as to many of same the Engineer stated he agreed with the demands and position of plaintiff in connection therewith, thereby waiving any requirement that plaintiff make further demand upon him regarding the same.

38. The District Court erred in ruling that plaintiff had waived any right it ever had to rescind the contract. This ruling is made in sub-paragraph 9 of finding of fact XIV, and elsewhere in the findings made and adopted by the court, and is erroneous in that same is contrary to the overwhelming weight of the evidence, which shows that plaintiff promptly rescinded the contract after it was first notified progress payments due to it would not be made in accordance with the terms of the contract, but on the contrary, same would be reduced by $500.00 per day, deducted for penalty for failure to complete the work under the contract prior to May 24, 1936.

39. The District Court erred in ruling that plaintiff was obligated to obtain the consent of the Engineer before doing any work which was done by it

and involved in its claims in this case, which was in excess of the amount or price for the work fixed in the contract. This ruling was made in finding of fact XV, and elsewhere in the findings made and adopted by the court, and is erroneous in that same is contrary to the proper interpretation of the contract, which did not require any such authority from the District Engineer.

Furthermore, finding of fact XV is directly contrary to the evidence in the record which is uncontradicted that on many occasions plaintiff objected, both orally and in writing, that the work it was being required to perform was different from that represented by defendant to plaintiff and described in the contract.

40. The District Court erred in ruling that the contract between the parties was entered into on the 4th day of June, 1934. This ruling was made in finding of fact XVIII, made and adopted by the court, and is erroneous in that under the applicable law the contract was not entered into until the 14th day of June, 1934.

41. The District Court erred in ruling that plaintiff did not perform any other work for defendant than the work specified in the contract between the parties. This ruling was made in finding of fact XXI, and elsewhere in the findings made and adopted by the court, and is erroneous because the overwhelming weight of the evidence shows that plaintiff performed approximately twice as much work for defendant in the construction in the tun-

nels as the amount specified for same in the contract.

42. The District Court erred in ruling that plaintiff was not entitled to judgment against defendant. This ruling is contained in paragraph 1 of conclusions of law made and adopted by the court, and is erroneous for the reasons set forth in this statement of points relied on by appellants next preceding the statement of this point, and for each and all of said reasons; and for the further reason that the uncontradicted evidence in the case, and the overwhelming weight of the evidence required that the court rule that plaintiff was entitled to judgment against defendant in accordance with the prayer of the complaint because of the breach of said contract made by defendant as set forth in the foregoing statement of points.

43. The District Court erred in ruling that defendant was entitled to judgment against plaintiff on the complaint and the answer thereto, as such ruling was without evidentiary support and each and all findings of fact made by the court and which are hereinabove mentioned in this statement of points on which appellants will rely are without evidentiary support or are contrary to the overwhelming weight of the evidence.

44. The District Court erred in failing to dismiss the cross-complaint for the reason that same did not state a cause of action against any of the cross-defendants.

45. The District Court erred in giving judgment for any amount whatever in favor of defendant on its cross-complaint. This ruling is found in conclusions of law 2, 4 and 5 made and adopted by the court; and is erroneous in that the cross-complaint was prematurely filed as the contract between plaintiff and defendant did not permit the doing of the work except by the forces of the defendant itself in the event that the defendant was required for any reason to complete same; and because no notification had been given by defendant to any of the cross-defendants of the amount of its claim after it completed the work and before commencing action, or of any balance due for same.

46. The District Court erred in ruling that cross-defendants were obligated to pay defendant and cross-complainant under the terms of the contract any sum whatever per day as liquidated damages. This ruling was made in findings of fact XXXIII, XXXIV, XXXV and XXXVI, and elsewhere in the findings made and adopted by the court, and is erroneous in that there is no authority in fact or in law in this case for assessment of liquidated damages against the cross-defendants because same cannot be assessed in this case as they are contrary to the provisions of the contract which contains a specific method to determine any loss occasioned by defendant and cross-complainant in the event it did any portion of the work.

Finding of fact XXXV is not supported by the evidence which is uncontradicted that, if defendant

were entitled to recover at all, any damages suffered from delay in completing the work can be readily and easily ascertained.

47. The District Court erred in ruling that plaintiff did not rely upon the representations contained in geological report in forming its bid, and that defendant made no representations to plaintiff by means of any geological report in making its bid. This ruling was made in finding of fact XXXIX, and elsewhere in the findings made and adopted by the court, and is erroneous in that same is unsupported by any evidence and is contrary to the uncontradicted testimony.

48. The District Court erred in ruling that defendant did not represent by the plans or the specifications or any geological report that the tunnels would be driven through self-supporting ground for any percent of their total length, or could be constructed with the use of temporary timber support for the excavation of same, and that defendant made no representations in this particular. This ruling was made in finding of fact XL, and elsewhere in the findings made and adopted by the court, and is erroneous in that same is not supported by any evidence and is contrary to the uncontradicted testimony in the case.

49. The District Court erred in ruling that plaintiff performed any of the work under the contract in the construction of the tunnels without belief in any representations made by defendant

except those in the notice to bidders, contract, plans and specifications. This ruling was made in finding of fact XLI, and elsewhere in the findings made and adopted by the court, and is erroneous in that same is without any support in the evidence and is contrary to the uncontradicted testimony in the case.

50. The District Court erred in ruling that all expenditures by plaintiff in performance of the work were pursuant to and required under the contract, and that plaintiff spent nothing by reason of false representations by defendant. This ruling was made in finding of fact XLII, and elsewhere in the findings made and adopted by the court, and is erroneous in that same is contrary to the evidence in the case, and is without support in the evidence, which affirmatively shows that plaintiff expended twice as much money as would have been required to have been expended if the conditions had been as represented by the defendant.

51. The District Court erred in finding that plaintiff was not required to do work different from that and in excess of that required under the contract in constructing the tunnels by reason of misrepresentations of underground conditions by the defendant. This ruling was made in findings of fact XLIV and XLV, and elsewhere in the findings made and adopted by the court, and was erroneous in that same is contrary to the evidence in the case, and the uncontradicted testimony to the effect

that plaintiff performed approximately twice as much work as would have been required if the tunnels had been through ground of the character represented and predicted in the contract, plans and specifications, and geological report.

52. The District Court erred in ruling that plaintiff was not called upon to do radically different work from that required under the contract under the conditions as represented to plaintiff by defendant. This ruling was made by the court in finding of fact XLVIII, and elsewhere in the findings and is erroneous in that same is contrary to the evidence, and without evidentiary support.

53. The District Court erred in making finding of fact XLIX because same is contrary to the evidence in the case, which evidence is uncontradicted and establishes that plaintiff was unavoidably delayed in the performance of the work, as hereinabove stated in this statement of points, and that none of said delays were caused by the acts of the plaintiff, and that the District Engineer and the defendant knew of the causes of the delay to plaintiff, but nevertheless said District Engineer and defendant fraudulently and capriciously and arbitrarily, and contrary to the contract provisions and the law, denied plaintiff any extension of time, although repeatedly requested to grant same, and although said District Engineer repeatedly promised he would recommend the grant of same.

54. The District Court erred in ruling that plaintiff was not mistaken as to the true condition

of the ground through which the tunnels were driven. This ruling was made in finding of fact L, and elsewhere in the findings made and adopted by the court, and is erroneous in that same is without evidentiary support and is contrary to the uncontradicted evidence in the case.

55. The District Court erred in rendering any judgment whatever on the cross-complaint against the cross-defendants based upon any delay in completion of the work. This ruling is found in paragraph 2 of conclusions of law made and adopted by the court, which are based upon findings of fact XXXIII, XXXIV, XXXV and XXXVI, made and adopted by the court, and is erroneous in that there was no proof whatever that cross-complainant sustained any damage by any delay in completion of the work.

56. The District Court erred in denying the request or motion of plaintiff and all the cross-defendants to make the amendments and alterations proposed by plaintiff and cross-defendants to defendant's proposed findings of fact and conclusions of law.

57. The District Court erred in denying the motion of plaintiff and all the cross-defendants to make the findings of fact and conclusions of law requested by plaintiff and cross-defendants. Said findings of fact which plaintiff and cross-defendants requested the Court to make are all supported by the uncontradicted evidence and were a correct, complete and accurate statement of the ultimate

facts proved by the uncontradicted evidence in the record and were and are material and necessary to a correct decision on the issues in the case.

The findings made by the court, in addition to being erroneous for the reasons hereinbefore stated in these points and being, in the main, mere conclusions, do not contain any finding at all on many of the ultimate facts necessary to a correct decision of the issues and are inadequate, incomplete and insufficient to comply with law and the rules governing the making of findings of fact.

The conclusions of law requested by plaintiff and cross-defendants are correct statements of the proper legal conclusions which the court should have made on proper and correct findings of the ultimate facts proved by the uncontradicted evidence in the record.

58. The District Court erred in denying the motion of the cross-defendants to dismiss the cross-complaint. Said cross-complaint did not state a cause of action against any of the cross-defendants because the cross-complaint is based on the claim that plaintiff abandoned the work under the contract and, under the terms of the contract and particularly under the provisions of paragraph numbered 5 thereof, on page 4, and the provisions of Section 6 (q) of the specifications, defendant was required, in case of abandonment of the work under the contract, to complete it with its own forces prior to any liability arising on the part of plaintiff or the other cross-defendants to pay the excess, if

any, of the cost of completing the work over the price stipulated in the contract between plaintiff and defendant for doing the uncompleted work. The undisputed evidence shows that defendant never completed the work with its own forces and that the event never occurred which gave rise to a cause of action in favor of defendant and against the cross-defendants, or any of them.

59. The District Court erred in denying the motion of cross-defendants to dismiss the cross-complaint on the ground that the Court did not have jurisdiction of the parties thereto. The pleadings show, and it is undisputed, that when the cross-complaint was filed defendant and cross-complainant was a resident and citizen of California and that two of the cross-defendants, namely, Fireman's Fund Indemnity Company and Pacific Indemnity Company, were residents and citizens of California. The Court, therefore, had no jurisdiction to entertain the cross-complaint and as jurisdiction did not exist when the cross-complaint was filed, it was not acquired by dismissing these two defendants during the course of the trial and in dismissing those two cross-defendants the District Court erred.

60. The District Court erred in denying the motion of cross-defendants to dismiss the cross-complaint on the ground that it was prematurely filed for the following reasons:

(1) The cross-complaint was based on the alleged right of cross-complainant to recover the excess cost of completing the work over the price

therefor stated in the contract between plaintiff and defendant because of an alleged abandonment of the work by plaintiff. The right of cross-complainant to recover in such case is based on the provisions of paragraph numbered 5 of the contract, on page 4, and the provisions of Section 6 (q) of the specifications and is limited thereby.

Under said provisions no right to recover any excess in cost arose until cross-defendant both completed the work and notified cross-defendants of such excess cost. The undisputed evidence shows that cross-complainant had not completed the work when it filed the cross-complaint and there is no evidence whatever that it ever notified any of the cross-defendants that the cost to cross-complainant of completing the work exceeded the contract price for completing it or that there was any such excess cost or that there was any demand for payment thereof.

(2) At the time the cross-complaint was filed the District Engineer had made no final estimate of the sum which would have been payable under the contract between plaintiff and defendant as required by Section 6 (q) of the specifications.

61. The District Court erred in including in the judgment on the cross-complaint any amount for liquidated damages, for the following reasons:

(1) The cross-complaint is based on the theory that plaintiff abandoned the contract. Section 4 (d) of the contract is not applicable as the measure of damages on such a cause of action. The contract

contains specific provisions for measuring and limiting the damages for abandonment. Those provisions are paragraph numbered 5 of the contract and Section 6 (q) of the specifications. Under those provisions the amount which cross-complainant is entitled to recover in case of abandonment is the excess of the cost of completing the work over the contract price and no more.

(2) Aside from the foregoing provisions of the contract specifically stating the measure of damages in case of abandonment the rule of law is well settled that provisions for liquidated damages for delay in performance such as those contained in Section 4 (d) of the contract do not constitute the measure of damages for delay in case of abandonment but that in such cases, no damages can be recovered for delay except such actual damages as are proved. Cross-complainant did not prove any actual damages from delay.

(3) Provisions in contracts stipulating liquidated or agreed damages for delay are void unless it would be impracticable or extremely difficult to fix the actual damages. Section 4 (d) of this contract is void because, if cross-complainant here suffered any actual damage from delay the amount thereof could have been easily fixed.

(4) The stipulated amount of damages in Section 4 (d) of the contract was so grossly disproportionate to any actual damages suffered by cross-complainant from delay that it constituted a penalty and said Section 4 (d) is void for that reason.

62. The District Court erred in denying the motions of plaintiff and cross-defendants for judgment on the complaint, cross-complaint and counterclaim of defendant.

63. The District Court erred in granting the motions of defendant for judgment on the complaint and cross-complaint.

64. Plaintiff and cross-defendants duly excepted to all of the rulings of the District Court hereinbefore mentioned and stated to have been erroneously made and appellants, in addition to all other points hereinbefore stated, will rely on appeal on each of such exceptions so made.

Appellants hereby designate as the parts of the record which they think are necessary for the consideration of such points, the following:

(1) All of the evidence and proceedings which the parties have stipulated and agreed, in a stipulation, dated February 21, 1939, and filed with the above entitled court, shall be printed or reproduced in the printed record.

(2) The agreed statements of fact included in, and attached to, said stipulation.

(3) All the exhibits which the parties hereto have, in said stipulation, stipulated and agreed need not be included in the printed record, because by their nature or character it is impossible or impracticable to include the same therein, but which have been sent to the above entitled court by the District Court for its inspection and use on the ap-

peal, and which the parties have stipulated and agreed in said stipulation may be so used.

Dated: February 21, 1939.

PAUL S. MARRIN,

Attorneys for Appellee.

[Endorsed]: Filed February 21, 1939. Paul P. O'Brien, Clerk.

[Title of Circuit Court of Appeals and Cause.]

STIPULATION DESIGNATING PARTS OF THE RECORD TO BE PRINTED.

It is hereby stipulated by and between the parties to the above entitled action that those parts of the record on appeal hereinafter designated be printed, or in case of photographs and drawings, reproduced and included in the printed record, and the Clerk of the above entitled court is requested to cause to be printed and reproduced in the printed record those parts of the record which the parties hereby designate as follows:

1. Complaint. R. P. 1.
2. Answer and cross-complaint. R. P. 5.
3. Answer of plaintiff and cross-defendant Six Companies of California to cross-complaint. R. P. 54. (Note: Exhibit A to the cross-complaint is a copy of Exhibit No. 18 which it is hereinafter stipulated shall be printed and for that reason said Exhibit A need not be printed.)
4. Answer of all cross-defendants other than plaintiff to cross-complaint. R. P. 76.
5. Stipulation waiving trial by jury. R. P. 98.
6. Amendment to complaint. R. P. 100.
7. Amendment to plaintiff's answer to cross-complaint. R. P. 104.
8. Amendment to cross-defendants', other than plaintiff, answer to cross-complaint. R. P. 108.
9. The following parts of the reporter's transcript of evidence and proceedings at the trial: Volume 2.

(1) Omit all of pages 1 to 100, both inclusive.

(2) Include all of the proceedings and evidence reported on pages 101 to 1543, line 18, both inclusive.

(3) Omit commencing with the words, "Now, if your Honor please," line 19, page 1543, to page 1556, lines 1 and 2, inclusive.

(4) Insert following line 18, page 1543, the following agreed statement:
"Here follows the argument of Mr. Alexander in support of his motion which has been omitted by stipulation."

(5) Include all of the proceedings and evidence reported on page 1556, commencing with line 3, the words "Mr. Smith," all the remainder of that page and all of page 1557.

(6) Omit page 1558, line 1, to page 1562, line 3, both inclusive.

(7) Include page 1562, beginning with line 4, and the words "Mr. Smith," to page 1568, line 25, both inclusive.

(8) Insert following line 25, page 1568, the following agreed statement:
"Here follows the argument of Mr. Smith in support of his motion and the argument of Mr. Wittschen for defendant and cross-complainant in reply to the arguments of Mr. Alexander and

Mr. Smith, which arguments have been omitted by stipulation."

(9) Omit page 1568, beginning with the words "Now, in supplementing" in line 26, to page 1617, line 5, both inclusive.

(10) Include commencing line 6, page 1617, with the words "The Court," all the balance of that page and all of pages 1618 and 1619.

(11) Include all of pages 1620 to 1729, line 2.

(12) Omit the balance of page 1729 commencing with the words "The Court," in line 3, to the end of line 10, page 1827, both inclusive.

(13) Insert following line 2, page 1729, the following agreed statement:

"Here follows the arguments of Mr. Wittschen for defendant and cross-complainant, the argument of Mr. Marrin for plaintiff, and the argument of Mr. Alexander for the cross-defendant surety companies, which arguments have been omitted by stipulation."

(14) Insert the following agreed statement and parts of the reporter's transcript: "During the course of Mr. Alexander's argument the following statements were made by the Court and respective counsel."

Insert beginning with the word "Why" page 1827, line 11, to the end of line 20, page 1837, both inclusive.

(15) Omit page 1837, commencing with the word "Continuing" in line 21, to the end of line 19, page 1876, both inclusive.

(16) Insert following line 20, page 1837, the following agreed statement:
"The remainder of Mr. Alexander's argument and Mr. Wittschen's argument in reply have been omitted by stipulation."

(17) Insert the following agreed statement and parts of the reporter's transcript:
"At the conclusion of Mr. Wittschen's argument (which has been omitted by stipulation) the following took place:
Then insert the reporter's transcript, commencing with the words "The Court" in line 20, page 1876, all the balance of that page and all of pages 1877, 1878 and 1879.

10. The following exhibits introduced in evidence by plaintiff:

(1) It is stipulated that an agreed statement of facts in the form hereto attached and marked Exhibit "A" shall be printed in the record in lieu of plaintiff's exhibits numbers 1, 5, 6, 8, 9, 11, 12, 13, 14, 15, 17, 19, 20 and 21.

(2) Those parts of Exhibit No. 3, (R. P.) being the specifications for the construction of the project of defendant, designated as follows:

(a) All of page 1, except that part of subparagraph (d) of Section 2, appearing thereon.

(b) Subparagraph (i) of Section 2, appearing on page 2.

(c) The title and all of Section 3, appearing on pages 2 and 3.

(d) The title and all of Section 4, appearing on page 3.

(e) All of Section 5 of Exhibit No. 10, which is an amendment to the specifications, commencing with the title "Section 5—Payments" and all the balance thereof shall be printed at this place in lieu of Section 5 of the original specifications which it superseded. R. P.

(f) The title and all of Section 6, appearing on pages 4 to 10, inclusive, and Section (z-6) of Exhibit No. 10.

(g) The title and all of Section 7, appearing on page 10.

(h) The title and all of Section 8, appearing on pages 11 to 13, inclusive.

(i) The title and all of Section 9, appearing on pages 13 and 14.

(j) The title and all of Section 10, appearing on pages 14 and 15.

(k) The title and all of Section 13, appearing on pages 17 to 21, inclusive.

(l) The title and all of Section 14, appearing on pages 21 and 22.

(m) The title and all of Section 15, appearing on pages 22 to 29, inclusive.

(n) The title and all of Section 17, appearing on pages 32 to 36, inclusive.

(o) The title and all of Section 32, appearing on pages 57 to 63, inclusive.

(p) The title and paragraphs 1, 2 and 3 of Section 33, appearing on pages 63 and 64.

(3) Exhibit No. 7, being an amendment to the specifications, dated January 9, 1934. R. P.

(4) Exhibit No. 4, engineer's estimate. R. P.

(5) Exhibit No. 16, the contract. R. P.

(6) Exhibit No. 18, bond for faithful performance. R. P.

(7) All of Exhibit No. 22, being the geological report. R. P.

(8) Exhibit No. 23, tracing of profile map. R. P.

(9) Exhibit No. 24, engineer's estimate of cost. R. P.

(10) Exhibit No. 25, drawing of location of drift. R. P.

(11) Exhibit No. 27, drawing of contemplated methods of construction of tunnels. R. P.

(12) Exhibit No. 34, sketch of proposed drilling and timbering jumbo. R. P.

(13) Exhibit No. 37, photograph of steel tunnel form and carrier. R. P.

(14) Exhibit No. 39, series of photographs showing conditions during excavation of west portal cut. R. P.

(15) Exhibit No. 40, photograph of footings for west portal buildings. R. P.

(16) Exhibit No. 41, drawing showing bracing at west portal. R. P.

(17) Exhibit No. 42, poster showing methods of excavation used. R. P.

(18) Exhibit No. 43, photograph inside tunnel May 1, 1935. R. P.___to___.

(19) Exhibits Nos. 45 to 57, both inclusive, all being letters. R. P.

(20) Exhibit No. 59, tabulation of north tunnel excavation progress. R. P.

(21) Exhibit No. 60, tabulation of south tunnel excavation progress. R. P.

(22) Exhibits Nos. 62 to 67, both inclusive, all being letters. Two drawings are attached to Exhibit No. 62 showing proposed concreting methods. R. P.

(23) Exhibit No. 68, series of six photographs of 1935 cave-in. R. P.

(24) Exhibits Nos. 69 to 72, inclusive, all being letters. R. P.

(25) Exhibit No. 73, summary of work completed by Six Companies of California. R. P.

(26) Exhibit No. 76, photograph. R. P.

(27) Exhibit No. 77, series of six photographs. R. P.

(28) Exhibit No. 78, photograph. R. P.

(29) Exhibit No. 81, drawing of typical square set. R. P.

(30) Exhibit No. 82, series of four photographs of square sets. R. P.

(31) Exhibit No. 83, drawing showing places in tunnels where square sets were placed. R. P.

(32) Exhibit No. 84, letter. R. P.

(33) Exhibit No. 85, series of three photographs. R. P.

(34) Exhibit No. 86, schematic photograph. R. P.

(35) Exhibit No. 87, series of four photographs of cave-in of February, 1936. R. P.

(36) Exhibit No. 88, order of Industrial Accident Commission. R. P.

(37) Exhibit No. 89, letter from Industrial Accident Commission. R. P.

(38) Exhibit No. 90, order of Industrial Accident Commission. R. P.

(39) Exhibit No. 91, order of Industrial Accident Commission. R. P.

(40) Exhibit No. 92, order of Industrial Accident Commission, with diagram attached. R. P.

(41) Exhibit No. 93, two photographs. R. P.

(42) Exhibit No. 94, revised construction schedule. R. P.

(43) Exhibit No. 95, letter. R. P.

11. Those exhibits introduced by plaintiff and which are not herein designated to be printed or reproduced in the printed record are omitted either because they are models, large drawings, charts, photographs and bulky tabulations which have, by order of the District Court, been sent to the United States Circuit Court of Appeals for the Ninth Circuit for its inspection and use upon this appeal and which it would be impossible or impracticable to reproduce in the printed record but which, subject to objections, if, any, made when introduced, it is stipulated may be considered by said Court of Appeals in deciding this appeal, or are exhibits which have been superseded by the agreed statement of facts attached hereto and marked Exhibit "A".

12. The following exhibits introduced in evidence by the defendant.

(1) Exhibit A, being page 22 from the application of defendant to the Public Works Administration. R. P.

(2) Exhibit B, being diagram map showing location of tunnels in vicinity of San Francisco Bay area. R. P.

(3) Exhibit C, being twelve photographs. R. P.

(4) Exhibit D, being the geological report of Hulin on the Claremont Tunnel. R. P.

(5) Exhibit E, being a letter from L. M. Larson to George D. Louderback. R. P.

(6) Exhibit F, being two leters. R. P.

(7) Exhibit G, a photograph. R. P.

(8) Exhibit H, a photograph. R. P.

(9) Exhibit I, a photograph. R. P.

(10) Exhibit L, a photograph. R. P.

(11) Exhibit M, a photograph. R. P.

(12) Exhibit N, letter and construction schedule. R. P.

(13) Exhibit O, letter and construction schedule. R. P.

(14) Exhibit P, perspective drawing of region of San Francisco Bay. R. P.

(15) Exhibit S, letter with statement of sequence of operations for first 100 feet and drawings. R. P.

(16) Exhibits T, U, V, W and X, all being letters. R. P. ..... to .....

(17) Exhibit Y, being an order of the Department of Industrial Relations of the State of California. R. P.

(18) Exhibits Z and AA, both being letters. R. P. ..... to .....

(19) Exhibit BB, letter and drawings. R. P.

(20) Exhibits CC to HH, both inclusive, all being letters. R. P. ..... to .....

(21) Exhibit II, letter with drawing attached. R. P.

(22) Exhibits JJ to ZZ, both inclusive, all being letters. R. P. ..... to .....

(23) Exhibit AAA, being a letter. R. P.

(24) Exhibit BBB, letter with drawing attached. R. P.

(25) Exhibits CCC and DDD, both being letters. R. P. ..... to .....

(26) Exhibit EEE, special safety order of Industrial Accident Commission. R. P.

(27) Exhibits FFF to JJJ, both inclusive, all being letters. R. P. ..... to .....

(28) Exhibit KKK, a letter with drawing attached. R. P.

(29) Exhibits LLL to TTT, both inclusive, all being letters. R. P. ..... to .....

(30) Exhibit UUU, being transcript of proceedings of a hearing before the Industrial Accident Commission held on September 24, 1935. R. P.

(31) Exhibit VVV, being a special safety order of the Industrial Accident Commission. R. P.

(32) Exhibit WWW, consisting of a letter, memorandum and copy of administrative order of the Federal Emergency Administration of Public Works. R. P.

(33) Exhibit XXX, being estimates numbers 1 to 23, inclusive. R. P.

(34) Exhibit YYY, being a letter and a copy of estimate No. 24 and check. R. P.

(35) Exhibit ZZZ, being a letter. R. P.

(36) Exhibits A-4 to C-4, both inclusive, all being letters. R. P.....to.....

(37) Exhibit D-4, being a letter and a copy of estimate No. 25 and check. R. P.

(38) Exhibit E-4, being a letter. R. P.

(39) Exhibit G-4, being two photographs. R. P.

(40) Exhibit H-4, being a photograph. R. P.

(41) Exhibit I-4, being a letter. R. P.

(42) Exhibits M-4-1 and M-4-2, being photographs. R. P. ..... to .....

(43) Exhibit N-4, being a photograph. R. P.

(44) Exhibit O-4, being a contract between defendant and the United States of America. R. P.

(45) Exhibit X-3, being a supplement to the specifications, dated August 17, 1936. R. P.

(46) Exhibit X-11, being a supplement to the specifications, dated September 23, 1936. R. P.

(47) Exhibits X-103 to X-108, both inclusive. R. P. ..... to .....

(48) It is stipulated that an agreed statement of facts in the form hereto attached and marked Exhibit "B" shall be printed in the record in lieu of defendant's exhibits

X-1, X-2, X-4 to X-10, both inclusive, and X-12 to X-102, both inclusive.

(49) Exhibit X-109, being a schedule of total amounts paid by defendant for completing project under contracts for schedules A, B, C, D, E, F, G and H. R. P.

(50) Exhibit X-110, being schedule showing amounts withheld from plaintiff and not appearing in any engineer's estimate. R. P.

(51) Exhibit X-111, being schedule showing computed total cost of construction of defendant's project based on unit prices set forth in contract dated June 4, 1934, between plaintiff and defendant and units of work performed. R. P.

(52) Exhibit X-112, being a schedule of computation of amount claimed by defendant from plaintiff for completion of the project. R. P.

(53) Exhibit X-113, being a tabulation by defendant of costs alleged to be attributable to cessation of work by plaintiff. R. P.

(54) Exhibit X-114, being a tabulation by defendant of costs of operations of defendant. R. P.

(55) Exhibit X-115, being a computation by defendant of interest calculations. R. P.

(56) Exhibit X-116, being affidavit and certificate of district engineer, dated November

29, 1937, respecting completion of defendant's project, filed with the Director of Public Works of the State of California on November 30, 1937, resolution of the Board of Directors of defendant, dated December 1, 1937, and certificate of County Clerk of Contra Costa County to filing of resolution with Board of Supervisors of Contra Costa County and certificate of County Clerk of Alameda County to filing of resolution with Board of Supervisors of Alameda County. R. P.

13. Clerk's minute order of May 27, 1938. R. P. 112.

14. Order granting motion for judgment on complaint in favor of defendant. R. P.

15. Clerk's minute order of May 31, 1938. R. P. 113.

16. Order denying motion to dismiss cross-complaint. R. P.

17. Order granting motion to dismiss cross-complaint as to cross-defendants Fireman's Fund Indemnity Company and Pacific Indemnity Company. R. P.

18. Clerk's minute order of June 1, 1938. R. P. 114.

19. Order granting motion to amend cross-complaint on face. R. P.

20. Dismissal of cross-complaint as to Fireman's Fund Indemnity Company and Pacific Indemnity Company. R. P. 115.

21. Clerk's minute order of June 2, 1938. R. P. 117.

22. Stipulation and order for amending answer and cross-complaint. R. P. 118.

23. Clerk's minute order of August 8, 1938. R. P. 131.

24. Opinion of the Judge of the District Court. R. P. 121.

25. Findings of fact and conclusions of law, being the same as those requested by defendant. R. P. 132.

26. Stipulation and order extending time of plaintiff and cross-defendants to submit findings of fact and conclusions of law and proposed amendments to defendant's requested findings of fact and conclusions of law. R. P. 188.

27. Plaintiff's and cross-defendants' objections and amendments to defendant's requested findings of fact and conclusions of law and plaintiff's and cross-defendants' requested findings of fact and conclusions of law. R. P. 193.

28. Judgment. R. P. 261.

29. Notice of entry of judgment prepared and served by the Clerk on September 27, 1938, and proof of service. R. P. 267.

30. Defendant and cross-complainant's notice of entry of judgment and proof of service, filed on September 30, 1938. R. P. 268.

31. Notice of appeal dated November 25, 1938, and filed November 25, 1938. R. P. 273.

32. Clerk's notice that notice of appeal was filed by plaintiff and cross-defendants on November 25, 1938. R. P. 276.

33. Supersedeas bond. R. P. 277.

34. Appellants' designation of contents of record on appeal. R. P. 300.

35. Stipulation that District Court may order all original papers and exhibits sent to the United States Circuit Court of Appeals for the Ninth Circuit. R. P. 302.

36. Order of District Court that all original papers and exhibits be sent to the United States Circuit Court of Appeals for the Ninth Circuit. R. P. 305.

37. Stipulation that District Court may extend time for filing and docketing record on appeal with the United States Circuit Court of Appeals for the Ninth Circuit to and including February 21, 1939. R. P. 307.

38. Order of District Court extending time for filing and docketing record on appeal with the United States Circuit Court of Appeals for the Ninth Circuit to and including February 21, 1939. On file with the Clerk of the Circuit Court of Appeals.

39. Stipulation as to contents of record on appeal. R. P. 338.

40. District Clerk's certificate to record on appeal. R. P. 343.

41. Those exhibits introduced by defendant and which are not herein designated to be printed or

reproduced in the printed record are omitted either because they are drawings, charts, photographs, catalogs and bulky tabulations which have, by order of the District Court, been sent to the United States Circuit Court of Appeals for the Ninth Circuit for its inspection and use upon this appeal and which it would be impossible or impracticable to reproduce in the printed record but which, subject to objections, if any, made when introduced, it is stipulated may be considered by said Court of Appeals in deciding this appeal, or are exhibits which have been superseded by the agreed statement of facts attached hereto and marked Exhibit "B".

This stipulation is made pursuant to subparagraph 6 of Rule 19 of the United States Circuit Court of Appeals for the Ninth Circuit and it is stipulated by all the parties hereto that the parts of the record which it is hereby stipulated shall be printed will contain all parts thereof which are necessary or material to a consideration of the points upon which appellants will rely on this appeal, except certain exhibits hereinbefore mentioned, consisting of models, large drawings, charts, photographs, catalogs and bulky tabulations which it is impossible or impracticable to print or reproduce in the printed record; provided, however, that should anything material to either party be omitted from the printed record by error or accident or should anything be misstated therein, the parties hereto stipulate and agree that such omission or

misstatement shall be corrected and, if necessary, that a supplemental record shall be printed.

[Endorsed]: Filed Feb. 21, 1939. Paul P. O'Brien, Clerk.

[Title of District Court and Cause.]

TESTIMONY

Wednesday, April 13, 1938.

The Court: You may proceed with the Six Companies Case.

Mr. Marrin: May it please the Court, we have a number of formal matters in connection with the execution of the contract which the defendant is ready to produce, and which we are going to put in by stipulation, thus saving as much time as possible. Mr. Tinning, you have the resolution of March 30, 1933?

Mr. Tinning: Yes.

Mr. Marrin: Will it be stipulated that is a certified and correct copy of a resolution adopted by the Board of Directors of the defendant Joint Highway District No. 13 on March 30, 1933, approving final surveys, plans, specifications, and detailed drawings and final estimate of cost of the project proposed to be constructed by the Defendant, Joint Highway District No. 13, and directing a certified copy thereof be transmitted by the Secretary of the District to the Director of the Department of Public Works of the State of California for his approval.

Mr. Tinning: So stipulated.

Mr. Marrin: We offer this in evidence.

The Court: It will be admitted and marked.

(The document was marked "Plaintiff's Exhibit 1.")

[Note: See Agreed Statement of Counsel set out in the Book of Exhibits at page 1.]

Mr. Marrin: In connection with all these matters, Mr. Tinning, will it be stipulated that inasmuch as these are copies they will be subject by both sides to comparison and check as to their correctness?

Mr. Tinning: Yes. Except as to the certified copy of the Resolution. I have not brought the original minutes, they are very voluminous, but they have all been double compared. Except as to those things I think in every instance I have an original here. I have the original plans here if you desire to inspect [486] them, of the project.

Mr. Wi' schen: May we have an understanding both ways, that when exhibits are going in and are copies that they are put in subject to correction?

Mr. Marrin: Surely. Will it be stipulated that these are the original plans?

Mr. Tinning: Those are a copy, and the original plans are here. They are in exactly the same form, and the filed plan has the endorsement of the secretary's file on this date. Those are originals taken from the same——

Mr. Marrin: We will stipulate, then, that this is a correct copy of the Plan for Construction of the Project of Joint Highway District No. 13 of the State of California, adopted by the resolution of the Board of Directors of Joint Highway District No. 31 by the Resolution which has been introduced as Plaintiff's Exhibit No. 1.

Mr. Tinning: March 30, 1933.

Mr. Marrin: I offer these in evidence as Plaintiff's Exhibit.

(The plans were marked "Plaintiff's Exhibit 2.")

Mr. Marrin: Will it be stipulated that this document entitled "Joint Highway District No. 13 of the State of California—Specifications for Construction of Project including Highway, Highway Tunnel and Approaches with Appurtenant Structures," is a true copy of the specifications for the construction of the project, with the exception of the Engineer's Estimate, which was filed on March 30, 1933, and was adopted by the Resolution of the Board of Directors of the District, which has been introduced in evidence as Plaintiff's Exhibit No. 1?

Mr. Tinning: The specifications are a true copy and I think under our act the estimates are a separate document, call for a [487] separate document. The copy of the estimate is a true copy of the copy of the specifications.

Mr. Marrin: We offer in evidence first the specifications for the construction of the project which I have described.

(The document was marked "Plaintiff's Exhibit 3.")

[Set forth in the Book of Exhibits at page 4.]

Mr. Marrin: We next offer in evidence the Engineer's Estimate.

(The document was marked "Plaintiff's Exhibit 4.")

PLAINTIFF'S EXHIBIT 4

FINAL ESTIMATE OF COST

A.	Tunnel with Ventilation and Portal Structures		$2,808,286.74
B.	Main Roadway:		
	West of Tunnel	$396,401.54	
	East of Tunnel	52,514.28	$ 448,915.82
C.	Landvale and Berkeley Connections		233,062.97
			$3,490,265.53
	Add Engineering, Supervision and Overhead, 7½%		$ 261,769.91
			$3,752,035.44

(Signed) WALLACE B. BOGGS.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Plff's Ex. No. 4. Filed April 13, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

Mr. Marrin: Will it be stipulated that this is a true copy of the certificate of Earl Lee Kelly dated April 5, 1933, approving the final surveys, plans and specifications and detailed drawings theretofore prepared by Joint Highway District No. 13 for the construction of its project, and adopted by the Board of Directors on March 30, 1933?

Mr. Tinning: So stipulated.

Mr. Wittschen: Give Mr. Kelly's official title.

Mr. Tinning: Director of the Department of Public Works of the State of California.

Mr. Marrin: We offer that in evidence.

(The document was marked "Plaintiff's Exhibit 5.")

[Note: See Agreed Statement of Counsel set out in the Book of Exhibits at page 1.]

Mr. Marrin: Will it be stipulated that this document entitled "Resolution of the Board of Directors of Joint Highway District No. 13 of the State of California approving amendments and supplements to specifications accompanying and forming a part of the final surveys, plans, specifications, detailed drawings, including a final estimate of cost, of the project proposed to be constructed by Joint Highway District No. 13 of the State of California, filed by Wallace B. Boggs, District Engineer, with the Board of Directors of said Joint Highway District on the 9th day of January, 1934, and directing a certified copy thereof to be transmitted by the [488] secretary of this District to the Director of the Department of Public Works of the State of California for his approval," is a true copy of a resolution adopted by the Board of Directors approving first amendment to the specifications, which resolution was adopted on January 9, 1934?

Mr. Tinning: So stipulated.

Mr. Marrin: We offer that in evidence.

(The document was marked "Plaintiff's Exhibit 6.")

[Note: See Agreed Statement of Counsel set out in the Book of Exhibits at page 1.]

Mr. Marrin: Will it be stipulated that this document entitled "Joint Highway District No. 13 of the State of California, Amendments and Supplements to Final Specifications for Construction of

Project, including Highway, Highway Tunnel and Approaches, with Appurtenant Structures" is a true copy of an amendment to the specifications prepared by the District which was adopted by Resolution of the Board of Directors on January 9, 1934?

Mr. Tinning: So stipulated. For the sake of the record, Mr. Marrin, I might say these are the amendments that were required under the P.W.A. grant to meet their requirements.

Mr. Marrin: We offer that in evidence.

(The document was marked "Plaintiff's Exhibit 7.")

[Set forth in the Book of Exhibits at page 140.]

Mr. Marrin: Will it be stipulated that this document is a true copy of the certificate signed by Earl Lee Kelly, Director of the Department of Public Works of the State of California, dated January 15, 1934, approving the amendments to plans and specifications for the project of the defendant as adopted by the Board of Directors of the defendant on January 9, 1934?

Mr. Tinning: So stipulated.

Mr. Marrin: I offer that in evidence.

(The document was marked "Plaintiff's Exhibit 8.")

[Note: See Agreed Statement of Counsel set out in the Book of Exhibits at page 1.]

Mr. Marrin: Will it be stipulated that this document entitled "Resolution of the Board of Directors of Joint Highway District [489] No. 13 of the State

of California approving second amendment and supplement to specifications accompanying and forming a part of the final surveys, plans, specifications, detailed drawings, including a final estimate of cost, of the project proposed to be constructed by Joint Highway District No. 13 of the State of California; filed by Wallace B. Boggs, District Engineer, with the Board of Directors of said Joint Highway District on the 3rd day of April, 1934, and directing a certified copy thereof to be transmitted by the Secretary of this District to the Director of the Department of Public Works of the State of California for his approval," is a true and correct copy of a resolution of the Board of Directors of Joint Highway District No. 13 adopted at a meeting of the Board of Directors held on April 3, 1934?

Mr. Tinning: So stipulated.

Mr. Marrin: I offer that in evidence.

(The document was marked "Plaintiff's Exhibit 9.")

[Note: See Agreed Statement of Counsel set out in the Book of Exhibits at page 1.]

Mr. Marrin: Will it be stipulated that this document entitled "Joint Highway District No. 13 of the State of California, Second Amendment and Supplement to Final Specifications for Construction of Project, Including Highway, Highway Tunnel and Approaches with Appurtenant Structures, Adopted April 3, 1934," is a true and correct copy of the Second Amendment to the Plans and Specifica-

tions for the construction of the project of the District which was adopted on April 3, 1934?

Mr. Tinning: So stipulated.

Mr. Marrin: We offer that in evidence.

(The document was marked "Plaintiff's Exhibit 10.")

Mr. Marrin: Will it be stipulated that this document is a true and correct copy of a certificate executed by Earl Lee Kelly, under date of April 6, 1934, approving the second amend- [490] ment to the plans and specifications for the project of Joint Highway District No. 13, approved by the Board of Directors by resolution dated April 3, 1934?

Mr. Tinning: So stipulated.

Mr. Marrin: I offer that in evidence.

(The document was marked "Plaintiff's Exhibit 11.")

[Note: See Agreed Statement of Counsel set out in the Book of Exhibits at page 1.]

Mr. Marrin: Will it be stipulated that this document entitled "Resolution of the Board of Directors of Joint Highway District No. 13 of the State of California giving notice to contractors that bids for the construction of the project of the district will be received and directing publication thereof" is a true and correct copy of a resolution adopted by the Board of Directors of defendant on May 4, 1934, and directing that notice shall be given to contractors for the submission of bids on the project of the District?

Mr. Tinning: So stipulated.

Mr. Marrin: I offer that in evidence.

(The document was marked "Plaintiff's Exhibit 12.")

[Note: See Agreed Statement of Counsel set out in the Book of Exhibits at page 1.]

Mr. Marrin: Will it be stipulated that the document entitled "Affidavit of Publication, In the Matter of Joint Highway District No. 13 State of California, Notice to Contractors," is a true and correct copy of an affidavit of publication in the Oakland "Tribune" of the Notice to Contractors, a copy of which is attached thereto?

Mr. Tinning: So stipulated.

Mr. Marrin: And it will be stipulated that that notice was published in the Oakland "Tribune" on the dates set forth in the affidavit?

Mr. Tinning: Yes.

Mr. Marrin: I offer that in evidence. [491]

(The document was marked Plaintiff's Exhibit 13.")

[Note: See Agreed Statement of Counsel set out in the Book of Exhibits at page 1.]

Mr. Marrin: Will it be stipulated that this document entitled "Joint Highway District No. 13 of the State of California. Bid Forms. 1. Bidder's Proposal Sheet; 2. Bidder's Certificate of Compliance with N.R.A.; 3. Bidder's Statement of Experience, Financial Responsibility and Technical Ability," is a true and correct copy of the bid submitted

by the plaintiff to the defendant on May 22, 1934, for the construction of the project of defendant?

Mr. Tinning: So stipulated.

Mr. Marrin: I offer that in evidence.

(The document was marked "Plaintiff's Exhibit 14.")

[Note: See Agreed Statement of Counsel set out in the Book of Exhibits at page 1.]

Mr. Marrin: Will it be stipulated that this document is a true and correct copy of the resolution adopted by the Board of Directors of the Defendant on May 29, 1934, awarding to plaintiff a contract for the construction of the project of defendant upon which plaintiff submitted a bid to the defendant on May 22, 1934.

Mr. Tinning: So stipulated.

Mr. Marrin: I will offer that in evidence.

(The document was marked "Plaintiff's Exhibit 15.")

[Note: See Agreed Statement of Counsel set out in the Book of Exhibits at page 1.]

Mr. Marrin: Will it be stipulated that this document entitled "Contract" between Joint Highway District No. 13 of the State of California and Six Companies of California, dated June 4, 1934, and signed by Joint Highway District No. 13 of the State of California by Thomas E. Caldecott, President and Harry M. Stow, Secretary, and by Six Companies of California, a corporation, by S. D. Bechtel, President and Edgar S. Kaiser, Secretary, is a true and correct copy of a contract entered into

between the plaintiff and the defendant for the construction of the project of the defendant?

Mr. Tinning: So stipulated. [492]

Mr. Marrin: I offer that in evidence, as "Plaintiff's Exhibit 16."

(The document was marked "Plaintiff's Exhibit 16.")

[Set forth in the Book of Exhibits at page 157.]

Mr. Marrin: Will it be stipulated that this document which is in my hand is a true and correct copy of a resolution adopted by the Board of Directors of Plaintiff on June 4, 1934, authorizing the officers of plaintiff to execute the contract and bonds between plaintiff and defendant for the construction of the project of defendant?

Mr. Tinning: So stipulated.

Mr. Marrin: I offer that in evidence.

(The document was marked "Plaintiff's Exhibit 17.")

[Note: See Agreed Statement of Counsel set out in the Book of Exhibits at page 1.]

Mr. Marrin: Will it be stipulated that this document entitled "Bond for Faithful Performance," dated June 12, 1934, and executed by plaintiff and the surety companies named therein, is a true and correct copy of the bond for faithful performance of the contract between plaintiff and defendant for the construction of the project of defendant?

Mr. Tinning: So stipulated.

Mr. Marrin: I offer that in evidence.

(The document was marked "Plaintiff's Exhibit 18.")

[Set forth in the Book of Exhibits at page 198.]

Mr. Marrin: Will it be stipulated that this document entitled "Bond for Materialmen and Laborers," dated June 12, 1934, and executed by plaintiff and the surety companies named therein, is a true and correct copy of the bond for materialmen and laborers which was filed with and approved by defendant in connection with the contract between plaintiff and defendant for the construction of defendant's project?

Mr. Tinning: So stipulated.

Mr. Marrin: I will offer that in evidence. [493]

(The document was marked "Plaintiff's Exhibit 19.")

[Note: See Agreed Statement of Counsel set out in the Book of Exhibits at page 1.]

Mr. Marrin: Will it be stipulated that this document is a true and correct copy of a resolution adopted by the Board of Directors of Defendant on June 14, 1934, approving the faithful performance bond filed by plaintiff with defendant?

Mr. Tinning: So stipulated.

Mr. Marrin: I offer that in evidence.

(The document was marked "Plaintiff's Exhibit 20.")

[Note: See Agreed Statement of Counsel set out in the Book of Exhibits at page 1.]

Mr. Marrin: Will it be stipulated that the document I have in my hand is a true and correct copy

of a resolution adopted by the Board of Directors of defendant on June 14, 1934, approving the bond for materialmen and laborers, filed by plaintiff with defendant?

Mr. Tinning: So stipulated.

Mr. Marrin: I will offer that in evidence.

(The document was marked "Plaintiff's Exhibit 21.")

[Note: See Agreed Statement of Counsel set out in the Book of Exhibits at page 1.]

Mr. Marrin: Will it be stipulated, Mr. Tinning, that the contract and specifications, plans and amendment thereto were prepared by defendant District?

Mr. Tinning: Yes.

Mr. Marrin: Have you the geological report referred to in the plans and specifications?

Mr. Tinning: Yes.

Mr. Marrin: Will it be stipulated, Mr. Tinning, that this document dated June 23, 1932, entitled "Geological Report" addressed to Mr. George A. Posey, District Engineer, Joint Highway District No. 13, 454 Fifth Street, Oakland, California, and signed by George D. Louderback, Consulting Geologist, is the original geological report referred to on page 58, Section 32, sub-section 4 of the specifications which have been introduced in evidence? [494]

Mr. Wittschen: Mr. Marrin, we will stipulate to the correctness of the identity and will not require you to prove the report, but will reserve all rights to object to the introduction of the reports in evi-

dence and the stipulation is not to be deemed to go further than merely save you the necessity of proof.

Mr. Marrin: I understand that. Your stipulation simply goes to the identity of this document, that it was the document referred to in the specifications?

Mr. Wittschen: Correct. You do not have to waste any time proving it, but we will object to its introduction.

Mr. Marrin: I offer this document entitled "Geological Report" in evidence.

Mr. Wittschen: We object to the introduction of that report in evidence, not only on the ground that it is incompetent, irrelevant, and immaterial, but on the further ground that it has no part in this case, and is an attempt to vary the contract between the parties. If your Honor will permit, I have some authorities I would like to present and argue that matter.

The Court: Well, I will offer this as a suggestion.

Mr. Wittschen: Certainly.

The Court: Probably in the interest of time, that it go in subject to your motion to strike and over your objection.

Mr. Wittschen: Yes.

The Court: And you may renew your motion at the end of the trial in relation to it. Make a note of it. Then I will be in a better position to rule after I get the picture.

Mr. Wittschen: Certainly.

Mr. Marrin: There is no objection, your Honor, to substituting a copy, which I understand Mr. Tinning desires to do.

Mr. Tinning: To save time later, the Geological Report, that [495] copy has certain maps and matter that were prepared under Dr. Louderback's direction, and were prepared by the District, and are not attached to this original document, and I am going to give you what you received from us, all those matters, to save time, later.

Mr. Marrin: Well, it will be stipulated, then, that the copy of the maps and profiles attached were true copies of what was submitted to bidders in connection with this contract?

Mr. Tinning: Yes.

Mr. Marrin: And, as you stated, it was received by us from you?

Mr. Tinning: Yes.

Mr. Marrin: I offer that in evidence.

Mr. Tinning: Subject to our objection.

(The document was marked "Plaintiff's Exhibit No. 22.")

[Set forth in the Book of Exhibits at page 212.]

Mr. Wittschen: Note an exception.

CHAD F. CALHOUN,

Called for the Plaintiff; sworn.

The Court: Q. What is your business or occupation?

(Testimony of Chad F. Calhoun.)

A. I am at present general manager of the Calhoun Company.

Q. What is the nature of their business?

A. It is oil well tubular supplies, oil well supplies.

Mr. Marrin: Q. Mr. Calhoun, I show you Plaintiff's Exhibit No. 16, which is a contract between Joint Highway District No. 13 and Six Companies of California, which is dated June 4, 1934. Prior to the date of that contract did you learn that the Joint Highway District No. 13 had advertised for bids for that contract? A. Yes, I did.

Q. When did you learn that?

A. In the forepart, the first part of February, 1934.

Q. How did you learn it?

A. First through the publication in the [496] Western Construction News Bureau Service and then by direct contact with the Chief Engineer of the Joint Highway District, Mr. Boggs.

Q. Did you take any action toward looking toward the preparing of the cost estimate for submitting a bid for that contract?

A. Yes, I did.

Q. Will you state what you did?

Mr. Wittschen: Was that for the Six Companies?

Mr. Marrin: It was not directly for the Six Companies. This was before the Six Companies was organized. We will connect it up later.

(Testimony of Chad F. Calhoun.)

Q. Will you state what you did?

A. I contacted the District Office through Mr. Boggs and secured the plans and specifications that were advertised in the official notice. I took those plans and specifications and made a complete study of all of the features that would relate particularly to the cost.

Q. What do you mean by "contacted"? Did you talk to him?

A. I talked to Mr. Boggs both over the phone and interviewed him in his office.

The Court: Who is Mr. Boggs?

Mr. Marrin: Who was Mr. Boggs?

A. The chief engineer for the Joint Highway District No. 13.

Q. You secured a copy of the plans and specifications?

A. I secured a copy of the plans and specifications as soon as they were made available to me by the District, which was around the forepart of February, as I now recall, February, 1934, and from those plans and specifications I made a thorough study of all of the construction features and some of the legal features, and the financial set-up of the district.

Q. Did you ever talk to Mr. Boggs about the Geological Report? [497]

Mr. Wittschen: I object to the question on the ground it is immaterial, irrelevant, and incompetent, and on the further ground the conversation with an

(Testimony of Chad F. Calhoun.)

employee is not binding on the District. You asked if he talked to him. I suppose my objection is premature.

Mr. Marrin: I want to bring out and offer to prove by this witness that this witness called at the office of the Joint Highway District No. 13 and asked the Chief Engineer for a copy of the Geological Report, which was mentioned in the specifications, and that he was told they did not have copies for distribution, but was shown a copy of the report and made a copy thereof, and a tracing from one of the profiles attached there, and also that Mr. Boggs gave to this witness an estimate of the cost of constructing the project. Mr. Boggs is the Chief Engineer. He will be rather prominent in this case because he was in charge of the defendant's office, and we think the proof is competent and binding on the District. Now, the specifications put out by the district refer the bidders to this Geological Report which is in the office of the District.

Mr. Wittschen: There is no question but what they had a right to look at the Geological report, but my objection is not directed to that, but the estimate of Mr. Boggs is his official estimate, which is on file, a copy of which you have, and the plans and specifications, but no conversation with Mr. Boggs can vary the written document. My objection is a little premature, because you have not asked him for the conversation yet.

(Testimony of Chad F. Calhoun.)

The Court: Did you talk to him? You may answer "Yes" or "No." A. Yes, I did.

Mr. Marrin: Q. What did you say and what did he say?

Mr. Wittschen: Objected to on all of the grounds previously [498] stated, it is immaterial, irrelevant, and incompetent, and that the District is not bound by conversations with Mr. Boggs or any other officer, and that the report speaks for itself, and that the defendant bid upon plans and specifications, and nothing else, not on a conversation.

The Court: Is your record complete?

Mr. Marrin: I simply want to show at this time by this witness that he asked for a copy of the Geological Report as I stated, and that Mr. Boggs showed him a copy, or at that time a copy was handed to him.

Mr. Wittschen: Exception.

The Court: Are you sure you copied it?

A. Yes, I did.

The Court: Proceed.

Mr. Marrin: Q. I show you Plaintiff's Exhibit No. 22 and ask you if that is a copy of the document which Mr. Boggs showed you?

A. As far as the written part is concerned, the text, that appears to be a copy of the report which I examined at that time, which was furnished me, but this report does not contain one profile-section that was in the report I examined at that time.

(Testimony of Chad F. Calhoun.)

Mr. Tinning: If you will give us the date I will try to check up and see what that is.

Mr. Marrin: About when did you examine that report?

A. As near as I can recall, it was around the middle of February.

Q. I think you said that the written matter was the same but there was some difference in the profile.

A. That is right.

Q. Did you read that report?

A. Yes, I did. I read it in its entirety.

Q. Did you copy any part of it?

A. I made notes on the forepart of the report that pertained to the outside construction, that is, the highway construction, and some of the viaduct work. I made a complete longhand copy of that portion pertaining to the highway [499] tunnel.

Q. Will you state the pages in the report of which you made a complete longhand copy?

A. Using the paging that is in this copy, I made a complete longhand copy of all of pages 13, 14, 15, 16, 17, 18 and 19.

Q. I show you, Mr. Calhoun, a profile which has on it "Broadway Tunnel, Joint Highway District No. 13, Geological Report, By George E. Louderback, July, 1930" with the notation "Copied from Report 2/17/34, C. F. C.," and ask you if you can tell me what that is?

A. Well, this is a photostatic reproduction of an exact copy or tracing that I made from a profile sec-

(Testimony of Chad F. Calhoun.)

tion attached to the report which I examined, as furnished to me by Mr. Boggs on February 17, 1934. This tracing or copy which I made was from a profile section attached to the report at that time, but which is not included in this exhibit here submitted to me previously.

Mr. Marrin: I offer that in evidence.

Mr. Wittschen: Objected to upon the ground that it is immaterial, irrelevant and incompetent, and furnishes no basis for proving any issue in this case.

Mr. Marrin: It is offered for the purpose of showing the representations which were made by the defendant to the plaintiff, or the inducement for entering into this contract.

Mr. Wittschen: I would like to be heard.

Mr. Marrin: On the issues of fraud, mistake and warranty.

Mr. Wittschen: I would like to make a few observations as to that. One is that this witness at that time was not working for the plaintiff, and, secondly, the authorities hold that the highway contractor cannot base his bid upon statements made by employees of the contracting party; he bases his bid upon the [500] contract and upon the specifications and since this Geological Report expressly was excepted from the specifications and there was a statement therein that the bidder was not to rely upon the same, but was to do his own geology; it was merely that he could look at it if he wished, and he

(Testimony of Chad F. Calhoun.)

expressly agreed that he would not hold the District responsible for anything connected therewith. It has no part in this case.

Mr. Marrin: If your Honor please, I do not agree with Mr. Wittschen's interpretation of the cases and on the question of the admissibility of statements made by the District Representative, and documents which they display to prospective bidders. I should like to cite to the Court the case of Stanton v. Morris Construction Company, a Minnesota Case, cited in 199 N. W. 104. In that case the County had prepared a map showing certain conditions to exist, and the attention of the bidders was called to the map. The plaintiff in this case, a contractor, had called at the office of the defendant, and certain statements had been made to the contractor by the engineer of the defendant, and the map was displayed to the contractor, and the map was offered in evidence and objection was made to it on the ground that Mr. Wittschen has made, that it was not part of the contract, and the Court said on that point:

"The claim made in the oral argument that the survey map was not a part of the plans and specifications of the contract and is not in evidence, cannot be sustained. It was offered by plaintiff, and was treated as received during the whole trial."

That, of course, is a little different than the case here. But the Court said:

(Testimony of Chad F. Calhoun.)

"Its importance to the vital issue in the case does not depend upon its being a part of the contract, but upon the fact [501] that the representations thereon were intended to and did induce defendant to make its bid and execute the contract."

Now in this case, if your Honor please, we have brought suit upon a common count which is a form of action that is well recognized in this State as being the proper form of action in case of a rescission of the contract; where the contract is rescinded for breach by the defendant, when it is rescinded for fraud or mistake, whether the fraud is implied or actual; the plaintiff cannot bring an action on the contract, but must sue on the common count. Now, it is well recognized in that class of cases that the plaintiff has the right not only to introduce the contract, but also to introduce any evidence of its breach.

In the case of Brown v. Crown Gold Milling Company, 150 Cal. 376, which was a case which was brought in the form of quantum meruit, and the plaintiff in the case introduced evidence of the express contract, and its breach, the Court held that the evidence was properly admitted and stated:

"Here the action is brought not upon an express contract, but upon a quantum meruit to recover the reasonable value of services. The contract which was shown by the evidence of plaintiff to have been made was not proven for the purpose of recovering upon it, but for the purpose of showing that it was

(Testimony of Chad F. Calhoun.)

entered into between himself and the defendant, its terms, and a breach of it on the part of defendant by discharging him without cause, for the purpose of recovering on a quantum meruit the reasonable value of the services he performed under it prior to its breach."

Now, in Castagnino v. Balletta, 82 Cal. 250—these cases, by the way, are cited in our trial brief—the Court held that the form of action on quantum meruit was proper; that evidence of the contract and its breach could be received. The Court [502] stated that the form of action on quantum meruit has been too long and too well settled in this State to be the subject of further debate or controversy, and quotes the following from Greenlief on Evidence, as a proper case for the use of the common counts:

"Where the contract, though partly performed, has been either abandoned by mutual consent, or rescinded and extinct by some act on the part of the defendant. Here the plaintiff may resort to the common counts alone for remuneration for what he has done under the special agreement."

And it says as to the admissibility of the evidence:

"In this case there is evidence tending to show that the architect accepted the building; that all other preliminaries were complied with by the plaintiff, and nothing remained but the payment of the money. The pleader, under such a state of facts, could set forth his cause of action under the com-

(Testimony of Chad F. Calhoun.)

mon counts adopted by him in accordance with the rules above set forth. And under such counts the special contract was admissible in evidence. (See Reynolds v. Jourdan, 6 Cal. 109, where it was held that the special contract was admissible under the common counts as an admission of the standard of value, or as proof of any other fact necessary to the recovery, and should be allowed to go to the jury whenever it can aid them in attaining a sound conclusion."

In another case, Breen v. Roy, 8 Cal. App. 475, the plaintiff was permitted by the Court to introduce the special contract and show that he was prevented from recovering it.

Now, the cases are very clear, if your Honor please, that in this form of action plaintiff may introduce a special contract and may show all of the breaches of the contract. If the plaintiff could not show the representations which had been made [503] as an inducement to enter into the contract the plaintiff would have no way to prove its right to rescind for fraud or for mutual mistake. And it is well settled in this State that the parol evidence rule does not prevent the admission of evidence to show misrepresentation in entering into a contract.

In the case of Ferguson v. Koch, 204 Cal. 342, the Supreme Court of this State said:

"Parol evidence is always admissible to prove fraud, and it was never intended that the parol evidence rule should be used as a shield to prevent

(Testimony of Chad F. Calhoun.)

the proof of fraud. Hence, the fact that the sale of an automobile is evidenced by a written contract will not prevent the purchaser from proving by parol evidence that the sale was induced by fraud. And this is true, even though the contract recites that all conditions and representations are embodied therein. There is no such sanctity surrounding a writing that parties may not be permitted to go back of it and show that there was such fraud practiced in the procurement of the same as to vitiate the writing. The law never countenanced a rule which would deny to one the right to prove that fraud had been practiced on him. In actions for rescission upon the ground of fraud the statutory provisions that when the terms of an agreement have been reduced to writing such writing is to be considered as containing all the terms, and that the execution of a contract supersedes all prior negotiations or stipulations, have no application and do not control. Appellant has cited us to certain earlier cases in our reports which he claims make a distinction between fraudulent representations going to induce the making of a contract and representations in the nature of warranties. There is no reason why any such distinctions should exist, and, in fact, none does exist." [504]

Now, then, there is another reason, if your Honor please, why we may introduce any evidence which we desire in this case on the parol question. Plaintiff sued on a common count. The defendant has

answered and set up a special contract by way of defense and avoidance. It is a well-established rule in this State that in such a state of the pleadings the plaintiff is free to introduce any evidence it has to overcome, set aside and void a special contract. I cite your Honor to the case of Maxwell v. Jimeno, 89 Cal. App. 612, in which case the plaintiff had sued upon a common count for money alleged to be due him for services. The answer set up an express contract and alleged that the services were performed under it. The lower court found that the contract was obtained by false and fraudulent representations and that plaintiff repudiated, canceled and rescinded it. Defendant appealed, urging that as the complaint did not allege fraud plaintiff could not prove it. However, the Court said at page 614:

"In Sarnighausen v. Scannell, the Court says: 'Under our form of pleading, there is no opportunity offered for the filing of a replication to the answer. When affirmative matter is pleaded as a defense it is deemed to be denied. Thus, where a contract is set up as a special defense, plaintiff, without pleading such matter, may show that it was procured by fraud, menace or duress, or that it has been rescinded."

And in Moore v. Copp, 119 Cal. 429, the Court said:

"Where the defendant has pleaded a written instrument in defense (not by way of cross-complaint), and the plaintiff has not served and filed an

(Testimony of Chad F. Calhoun.)

affidavit denying the instrument, and has offered no evidence controverting it on any ground, the instrument is to be deemed admitted and must be taken for what it appears on its [505] face to be. But the plaintiff may controvert the instrument by evidence of fraud, mistake, undue influence, compromise, payment, statute of limitations, estoppel, and the like defenses under Section 462 of the Code of Civil Procedure. In short, he may by evidence controvert the instrument upon any and all grounds, except that he cannot controvert its due execution nor its genuineness. By 'genuineness' is meant nothing more than that it is not spurious, counterfeit, or of different import on its face from the one executed, but is the identical instrument executed by the party."

Now, there is one other matter I would like to mention briefly, and that is the effect of the self-exonerating cause in this contract. The defendant in this case drew the attention of prospective bidders to this geological report and referred them to this information. It must have done so, as the Circuit Court of Appeals in this Circuit said in the Sartoris Case, for some purpose, and that purpose was unquestionably to influence the bid. Now, the defendant, in our opinion, cannot escape the responsibility for the representations it makes by saying that "I represent this to be so and so and represent this to be the fact, but I disclaim any liability for it."

(Testimony of Chad F. Calhoun.)

The decisions on the effect of the self-exonerating clause are referred to and summarized in the Passaic Valley Case—there are several of them in the United States Supreme Court, and other decisions which I will not burden you with this morning, but I would like to refer to this case and read a quotation from it as I believe it sets forth the law on this subject.

This Passaic Valley Sewerage Commissioners v. Holbrook, 6 Fed. (2d) 721, was a case in which a contract had been entered into for the construction of a sewer tunnel. The defendant in [506] that case had made borings and had transcribed the result of those borings on a certain map, which borings indicated that the formation would be a cemented Triassic formation, and would be impervious to water and air. It attached the following notation:

"The borings, soundings, contour lines, profile and indications of rock outcroppings, sub-surface materials, pipes, and other underground structures are supposed to be approximately correct, but should they be found to be otherwise the contractor shall have no claim on that account, it being expressly understood that the Commissioners do not warrant the plot to be approximately correct."

When it was found that the condition was not as indicated on the maps which were displayed by the defendant district to the bidder, prior to entering into the contract, and after the contractor had proceeded to some extent under the contract, it re-

(Testimony of Chad F. Calhoun.)

scinded the contract on the ground of breach of warranty, misrepresentation, mistake and fraud, and brought suit on quantum meruit, the same as we have here, to recover the actual cost of the labor performed, services rendered, and material furnished in the work. The defendant, after suit was brought, brought up this self-exonerating clause as a defense, saying while it displayed this information it did not warrant it in any way, and warned all bidders to make their own examination, but after reviewing the decisions of the Supreme Court of the United States on this point at some length the Court said:

"The last case on the subject and one containing facts which resemble closely those of the instant case, is United States v. Atlantic Dredging Company, 253 U. S. 1, where the self-exonerating clause in the contract there in question was similar to and just as strong as the clause here in question. In that case the [507] Supreme Court, citing its previous decisions, announced the law that, when a governmental body has asked for bids for excavation work and has represented the condition of the material to be excavated, and in its representations had misstated facts or had failed to state facts within its knowledge, it cannot escape responsibility by a clause of the contract in which it required bidders to examine the work for themselves and in which it said that its statements of facts were but expressions of its opinion and that it did not guarantee

(Testimony of Chad F. Calhoun.)

them. This, in effect, was a holding that representations made in such circumstances import a warranty, and also that, in consonance with familiar law, a person cannot contract against his own fraud."

Now, if your Honor please, this action is not an action on a contract. It arises out of a contract, but it is, in our opinion, a form of remedy for the breach. It is an action to recover for the reasonable value of work performed and material supplied under an express contract upon the ground that the plaintiff was induced by the representations of the defendant, which were untrue, to enter into the contract, and that the defendant breached the contract during its performance, and we offer to prove through this witness that misrepresentations were made to him, that these representations were passed on by him to the men who made the estimate for the doing of this work for the plaintiff. In that connection, your Honor, the plaintiff was not organized until May 15, 1934. So that you may understand the situation, a certain number of contractors, including the W. A. Bechtel Company and the Henry J. Kaiser Company, and four others, had certain conferences, at which they decided to, if the project was feasible, prepare and submit a bid. They employed certain men, including Mr. Calhoun and Mr. Larson, who will follow him on the stand, [508] to make an estimate of this project, and they did so. After the estimate was

(Testimony of Chad F. Calhoun.)

made and it appeared that these parties desired to submit a bid, they caused the plaintiff to be organized. The work which these men did and the estimates which they made were turned in to the plaintiff and were relied upon by the plaintiff in making this bid, and it is necessary to show these facts through this witness and show his examination and the reliance upon the information which was received. I offer to prove all of those matters through this witness and the following witness.

Mr. Wittschen: If your Honor please, I had no idea that the argument was going to take the range that it did in my objection to the question that I presumed in advance called for a conversation between this witness and an employee of the district.

The Court: The District Engineer?

Mr. Wittschen: The District Engineer.

The Court: He was the engineer on the job?

Mr. Wittschen: Yes. As far as this particular thing that is before the Court now, it is moot, because Mr. Tinning tells me that this map, which they seek to have admitted in evidence, has already been admitted in evidence as one of the maps that are attached to the Geological Report which your Honor admitted subject to our motion to strike. Following that the action on Mr. Marrin's part precipitated this controversy. I am trying to fix my record. But in view of the fact that Mr. Marrin has argued the pleadings which are not involved in

(Testimony of Chad F. Calhoun.)

this issue at all, I might say that they cannot, because we have filed an answer setting up certain things, that they cannot prove anything that is not put in issue by that answer. Of course that is elementary. There is no replication. That is not the point of my objection. The point of my objection is entirely misunderstood. While I am on [509] my feet, and in view of the fact that we are arguing this matter, I want to point out that in the case of McGovern et al v. City of New York the rule is laid down that in an action by a subway contractor against the city, parol evidence as to the construction placed by the contractor on the specifications when he was preparing and submitting his bid, and as to declarations made by a former subordinate employee of the City as to the meaning of the specifications, is inadmissible to aid in the construction of the contract and specifications.

Mr. Marrin: What is the citation of that?

Mr. Wittschen: McGovern et al v. City of New York, 195 N. Y. S. 925.

I have only scratched the surface on that particular subject. I think it is elementary in this State that you cannot come in and bind a public body by something that some employee may say in connection with the plans and specifications. A public body can only be bound by the action of its Board of Directors, and when it asks a bidder to submit a bid upon plans and specifications which it has prepared the bidder cannot come in and chat with the

(Testimony of Chad F. Calhoun.)

engineer and then come up and say "I understood something else."

In the Stanton Case, that Mr. Marrin cited, it holds no such thing. He, himself, told your Honor that there was quite a distinction there because the plan which was under discussion was a plan that was a part of the plans and specifications under which the bid was to be submitted.

Now, I will state in advance, so that we can immediately pass over a great part of Mr. Marrin's argument, that this objection is not made because of the nature of his pleading. The objection is made because of the introduction of this document, which really was the matter that was to be reserved and argued afterward. We [510] contend that he is trying to vary the contract between the parties. Now, in addition to that case which I spoke of I would like to refer to one other case before I deal with the main subject, and that is United Construction Co. v. City of St. Louis. All of these cases are in our brief, of which counsel and the Court have a copy. In that case there was a contract just as ours for the construction of a tunnel, and there was a question as to the remarks that were made by the engineer in charge and this is what the Court said:

"This shows an erroneous view of the law. Work of this character must be let on competitive bidding and to the lowest bidder."

Section so and so of the Missouri Statutes provides: "Requires that contracts of this character

(Testimony of Chad F. Calhoun.)

made by municipalities must be made in advance of doing the work and in writing, which shall specify the price to be paid. The contract cannot be modified, changed, or enlarged by verbal promises, and any such promise to pay more for the work than the contract provides is void. Municipal officers"—not employees—"have no such powers, and can do nothing except to see to it that the contract is complied with as made, and the work and material paid for as the contract specifies. The intent of the law is to place all bidders and contractors on an exact equality without chance of favoritism, and, when the contract is once made, the officers in charge of the work are executive and not contracting agents of the city."

One contractor or one bidder cannot go in and chat with the officer in charge and say that he got certain promises and certain inducements that no other contractor received.

The thing that I am really objecting to, hereunder is the matter [511] upon which your Honor reserved judgment, and I have no desire to argue the matter now. If your Honor would like that argument at this time we will make it.

The Court: It will not be necessary. I want to indicate to both sides that in these cases I am rather liberal in the introduction of evidence with this thought in mind, that both sides may protect their legal rights, they waive none of their rights, and

(Testimony of Chad F. Calhoun.)

then rule after the case is in and I have a picture. I allow testimony to go in subject to a motion to strike, unless it misleads either side in the presentation of the case.

Mr. Wittschen. We are not misled. I think both of us understand each other.

The Court: That is what I aim to do in every case presented, and I suggest it now, so that it may be helpful, and both sides have a record to protect their rights. I will allow the testimony to go in subject to a motion to strike over your objection.

Mr. Wittschen: And it is understood that we have an exception to your Honor's ruling?

The Court: Yes.

Mr. Wittschen: I will just state my objection hereafter without arguing it.

The Court: It is necessary to do that under the rule anyway so as to save your record. [512]

(After Recess)

The Court: You may proceed.

Mr. Marrin: I am not quite sure of the state of the record. This was offered, was it?

Mr. Wittschen: You have already got it in, subject to strike.

Mr. Marrin: Well, not exactly. This is a print made by Mr. Calhoun, from this.

Mr. Wittschen: Well, I make the objection that I made heretofore, on all the grounds stated.

(The chart was marked "Plaintiff's Exhibit No. 23.")

[Set forth in the Book of Exhibits at page 259.]

(Testimony of Chad F. Calhoun.)

Mr. Wittschen: Note an exception, please.

Mr. Marrin: Q. I again show you Exhibit No. 22. On your examination, you stated that that was not entirely correct,—that copy—an entirely correct copy of what you examined. Do you want to correct your testimony, in any way, in reference to that point? A. Yes, I do. During the recess, I examined it and found there is a photostatic print in the back of the blueprint which I examined, which is a copy of the print from which I made the tracing which you showed me. It differs from the blueprint which is attached to the report.

Q. The tracing you made is this photostat copy which is Plaintiff's Exhibit No. 23?

A. That is right.

Q. Mr. Calhoun, did you have any discussion with Mr. Boggs, concerning the finances of the District? A. Yes, I did.

Q. What did you say and what did he say?

Mr. Wittschen: We object to that as incompetent, irrelevant and immaterial, calling for hearsay testimony, and not in any way binding on the District or tending to prove any issue in this case.

The Court: This is preliminary to what?

Mr. Marrin: Preliminary to showing, if your Honor please, that Mr. Boggs, in the course of that conversation, brought out the engineer's estimate, the cost of the project, and exhibited it to Mr. [513] Calhoun; and that Mr. Calhoun made a copy of

(Testimony of Chad F. Calhoun.)

that estimate, which he later turned over to Mr. Larson; and we offer to prove those facts.

Mr. Wittschen: We add to the objection, furthermore, that the total of the engineer's estimate had been prepared and was on file, and that any conversation between the parties proves no issue in the case.

The Court: I will allow it, subject to your objection.

Mr. Wittschen: Note an exception, please.

Mr. Marrin: Q. Will you state what was said, upon the conversation? A. I discussed many features of the contract and specifications with Mr. Boggs, covering many items of interpretation upon questionable items of both the plans and specifications. Those are more or less routine and in the nature of my duties in preparing an estimate. Then I discussed with him, at great length, the finances of the District, going over with him the amount of money available from which the District could pay for the entire construction cost of the project.

Q. Did he show you his estimate of the cost?

A. Yes, he showed me that estimate.

Q. Did you make a copy of his estimate of cost, which he showed you?

A. I made a copy from the estimate of cost which he showed me. I made it in the District office.

Q. I show you a pencil memorandum, headed "Broadway Tunnel—Engineer's Estimate of Cost

(Testimony of Chad F. Calhoun.)

of Joint Highway District No. 13, copied 2-17-34, C. F. C.," and ask you what that is.

A. This is the note and original copy of my handwriting that I made of that engineer's estimate in the District office, upon that date,—February 17, 1934.

Q. To the best of your knowledge, is that a true copy of the estimate which Mr. Boggs showed to you? A. Yes, it is.

Mr. Wittschen: Pardon me, Mr. Marrin. Maybe I am a little confused. This says: "Above copied from typed copy shown to me by Mr. [514] Barclay in Mr. Boggs' office."

The Witness: Mr. Boggs—

Mr. Wittschen: I am not asking a question. I just wanted to bring that out.

Mr. Marrin: Q. Who showed you the estimate?

A. Mr. Boggs showed me the estimate. Mr. Boggs directed Mr. Barkley to make available for my use a table in an outer room there where I could examine not only the engineer's estimate in detail,—that is, at my leisure,—but, also, the geological report.

Q. Who was Mr. Barkley?

A. It was my understanding that Mr. Barkley was an assistant engineer to Mr. Boggs.

Mr. Marrin: I offer that document in evidence.

Mr. Wittschen: To which we will object as incompetent, irrelevant and immaterial, on the ground that it proves no issue, does not tend to, in any way,

(Testimony of Chad F. Calhoun.)

alter the contract between the parties and that the District and the contractor are bound by the contract as entered into between them, and not by any pre-bid conversation between any prospective bidder and an officer or an employee of the District.

The Court: I will allow it.

Mr. Wittschen: And on all the other grounds previously stated.

The Court: I will allow it, subject to a motion to strike and over your objection.

Mr. Wittschen: Note an exception, please.

(The document was marked "Plaintiff's Exhibit No. 24.")

PLAINTIFF'S EXHIBIT 24

Broadway Tunnel

Engineer's Estimate of Cost of Joint Highway District No. 13

Above copied from typed copy showed to me by Mr. Barclay in Mr. Boggs' office.—C.F.C.

[Endorsed]: No. 20101-R. Plff's Ex. No. 24. Filed April 13, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

(Testimony of Chad F. Calhoun.)

Mr. Marrin: Q. Mr. Calhoun, what did you do with this copy of the engineer's estimate that has been introduced in evidence as Plaintiff's Exhibit 24?

A. Some time later, after copying it for my own information, I turned it over to Mr. L. M. Larson of the W. A. Bechtel Company.

Q. Can you state the approximate date upon which you turned it over [515] to Mr. L. M. Larson?

A. It was during the first week in March of 1934.

Q. You stated that you copied the geological report, which is Plaintiff's Exhibit No. 22, pages 13 to 19, inclusive. What did you do with the copy which you made of those pages of the geological report?

A. I made a copy, typewritten, and turned the copy of that,—that copy,—over to Mr. L. M. Larson of the W. A. Bechtel Company.

Q. About what time?

A. At about the same time; at the same time I gave him the engineer's estimate in the forepart of March 1934.

Q. What did you do with the tracing, a photostatic copy of which has been introduced in evidence as Plaintiff's Exhibit No. 23?

A. I also turned over that original tracing to Mr. L. M. Larson, at the same time that I turned over the other documents.

Mr. Marrin: You may cross-examine.

Cross-Examination.

By Mr. Tinning:

Mr. Tinning: Q. When you saw Mr. Boggs, it was on February 17, 1934, was it not?

A. I am not sure whether I saw Mr. Boggs on that date or not.

Q. The memorandum, the tracing, bears date in your handwriting,—just to refresh your recollection,—2-17-34? A. Yes.

Q. These are your initials, are they not?

A. Yes.

Q. You say at that time that you discussed the finances of the District,—that is, the funds that were available, or expected to be available, to pay the contractor who took this job?

A. I am not sure that I discussed it on that particular date; but right around that.

Q. How many times did you visit the District office on the occasion of these transactions that you testified concerning?

A. I don't recall exactly; but I was over there several times during that period in February, when I was making an intensive study of the plans. [516]

Q. Where was your office at that time?

A. 1522 Latham Square Building.

Q. Whom were you employed by?

A. Henry J. Kaiser Company.

Q. Mr. Kaiser is president of the Six Companies at this time, or at that time?

A. I really don't know, at that time.

(Testimony of Chad F. Calhoun.)

Q. Did you ever know he was president?

A. Well, so far as I knew, Mr. S. D. Bechtel was president of the Six Companies of California, it was my understanding. I believe that Mr. Kaiser became president some time later; but I am not sure of that.

Q. When you talked with Mr. Boggs about the financing of this District matter, you had, from what you told us about it—you had in mind that you satisfied yourself that there would be funds there available to pay the contractor?

A. No; I do not recall I had any such thing in mind at all.

Q. What was your purpose in discussing it with Mr. Boggs?

A. Well, just to see if they did have enough money to pay for the entire project.

Q. Then, shouldn't your answer to my preceding question be "Yes"? I am not trying to jockey you, Mr. Calhoun.

A. Maybe I better have the question repeated?

Q. Mr. Calhoun, all I was trying to do was clarify what the purpose of the conversation was,—your discussion of finances was for the purpose of knowing whether or not there would be funds to pay the contractor who took the contract?

A. Yes.

Q. At that same conversation, or one of these other conferences that you say you had with Mr. Boggs, you discussed the plans and specifications,

(Testimony of Chad F. Calhoun.)

you discussed the geological report, and you also discussed the estimate of breakdown of quantities and cost of the various elements that entered into this project, with him, did you not?

A. I discussed the various features of the plans and specifications and the [517] geological report, but not the breakdown of the estimate of cost, not in detail. Mr. Boggs supplied that information to me in connection with our discussion regarding the finances of the District.

Q. Then, on the same day that you discussed the finances of the District, you also discussed this sheet which has now been introduced,—the matters which are involved in that sheet that has been introduced as Plaintiff's Exhibit 24?

A. No; I am not sure whether it was the same day or not.

Q. What kind of a document was it that Mr. Boggs displayed to you?

A. You are referring now to—

Q. To what we have just been talking about,—the estimate made of the breakdown.

A. As I recall it, it was a typewritten sheet.

Q. One sheet, or in a book?

A. Well, to the best of my recollection, it was a sheet that was attached to several other sheets. I don't recall it was a book that was made available to me.

Q. Didn't you say, a few moments ago,—just to refresh your recollection, Mr. Calhoun,—that you

(Testimony of Chad F. Calhoun.)

went into another room, Mr. Barkley got out a book and you copied this data?

A. No; I said they made available to me the estimate.

Q. Well, what form was it in? Was it in several sheets, or were there six or seven or fifty sheets?

A. That is putting quite a strain on my memory. That was about four years ago, and I have examined many reports since then, and it is a little difficult for me to state definitely what form that was in. I will say this: that, at the time I was talking to Mr. Boggs, I do believe he had a copy of the estimate in a looseleaf book, which he referred to. Then, when he directed Mr. Barkley to make this information—the geological report and the estimate—available to me, I don't recall whether it was a book or whether it was another copy. [518]

Q. Do I understand that the copy of your original notes purports to be a copy of what was on the sheet that you saw there, even to the title, "Broadway Tunnel, Engineer's Estimate of Cost of Joint Highway District No. 13"?

A. Well, that is my own handwriting; and I cannot say that, as to the title, it would be exactly complete—only in keeping with my usual habit in such matters—I copy off enough to thoroughly identify it to my own satisfaction at that time.

Q. Was it all written at the same time? I am

(Testimony of Chad F. Calhoun.)

referring now to Plaintiff's Exhibit 24,—Your original memorandum.

A. It was all written at that particular time, with the exception of certain items here, under this column headed "Unit."

Q. The column headed "Unit" is for prices attributed to the quantities, is it not?

A. That is right.

Q. When was that written in?

A. That was written in after I returned to my office.

Q. Where did you get those figures?

A. By dividing the total estimated cost, over here, by the total shown against the quantity cost.

Q. In other words, you took the right-hand column, which is "Total," and divided the "Quantity," and that is the total in dollars, is it?

A. Well, that is the total in dollars, yes.

Q. Dividing the quantity with the unit, the various prices, and got the price per unit?

A. There is some question in my mind as to how that unit was arrived at. I am just trying to endeavor to give you a correct answer, because, as I say, it is of some standing. To the best of my recollection, that was the manner in which I determined the units there.

Q. So that, in this exhibit, you did not put down, from the records of the District, the unit prices that appear in the first column to the right of the various items as shown; those were com-

(Testimony of Chad F. Calhoun.)

puted by you, [519] by some method, and put down, yourself?

A. I believe that is correct, unless these units did show on the original copy. It is my recollection, though I worked those out, myself. If they appeared on the original, I also copied them from the original, that was submitted to me.

Q. Well, it is quite apparent, from looking at this, that those units—the figures were not written by the same pencil at the same time that the remaining figures on that sheet were made; isn't that true? A. It appears to be that, yes.

Q. There are unit prices attributed only to certain items as shown here. Now, with respect to the memoranda at the bottom of the page: "Above copied from typed copy showed to me by Mr. Barkley in Mr. Boggs' office"—I am now referring to Plaintiff's Exhibit 24—Was that written at the same time, in Mr. Barkley's office, or Mr. Boggs' office, or was that put on at a later time?

A. That was put on as soon as I returned to my office.

Q. Those unit prices: you are uncertain, at this time, as I understand it, that they were computed by you, or whether they were found on the document from which you made the remainder of this copy?

A. That is right; but my best recollection is I divided the total in dollars by the quantities shown, and obtained that result.

(Testimony of Chad F. Calhoun.)

Q. In any conversation with Mr. Boggs that you had, you were advised, were you not, that the District would not receive bids,—I believe the date was set in March,—the notice would be recalled, due to some PWA requirement; you were advised, at that time when you talked to him, that the bids,—the actual bids,—would be called at some later date on the same plans and specifications?

A. No; I don't recall any such statement.

Q. You don't recall that?

A. No; I do not, at the time I was interviewing Mr. Boggs, at this particular time. [520]

Q. You have no memory of that information coming to you at that time?

A. No. I think there was some question that, under the discussion on the finances of the District —I am just recalling now—that there was pending before the courts a suit for the validity of the District bonds.

Q. To refresh your mind further: did you discuss the fact that there was a proceeding to be brought, to determine the validity of the bonds in this District, and that that was to be brought and it had not been commenced?

A. Well, I think you could answer that better than I can.

Q. I am trying to refresh your memory as to that conversation. But your testimony now is, in the present state of your memory, you did not re-

(Testimony of Chad F. Calhoun.)

ceive any information at the time you were going over the District figures and specifically estimating the outside work, that the bids would not actually be received at the time the notice called for, that there would be a notice withdrawing that matter, that would and it would be republished ?

A. As I recall it, it was around the first part of March when we received such information.

Q. But you did receive such information just before you turned the papers over to Mr. Larson and whoever else you turned it over to?

A. Yes.

Q. Is the reason you turned them over that the matter was being delayed?

A. No, no; not at all.

Q. Was Mr. Larson also working for Mr. Kaiser at that time?

A. Mr. Larson, at that time, was, I believe, working for the W. A. Bechtel Company.

Q. Another one of the units ultimately joined in this proceeding? A. Yes.

The Court: We will take a recess now until two o'clock.

(Thereupon, an adjournment was taken until 2 o'clock p. m., this date.) [521]

(Testimony of Chad F. Calhoun.)

Afternoon Session—2:00 O'Clock.

CHAD F. CALHOUN,

Cross-Examination (Resumed).

Mr. Tinning: Q. Mr. Calhoun, in looking over my notes that I took of your testimony this morning there are one or two things I would like to make clear, or that perhaps I am not clear on, myself.

I understood you to say you were employed when you made this investigation in February, 1934 by Henry J. Kaiser. Were you employed by Mr. Kaiser personally, or by the Henry J. Kaiser Company?

A. It may have been the Kaiser Paving Company at that time, I am not exactly sure. My actual conditions of employment were made with Mr. Kaiser, personally.

Q. He made the arrangement with you.

A. Yes.

Q. You don't recall at that time whether you were an employee of the Henry J. Kaiser Company or the Kaiser Paving Company?

A. I think my employment at that time was possibly directly with the Kaiser Paving Company.

Q. Did you have anything more to do with the transaction or investigation of this work than you have explained this morning, starting sometime in February, 1934 and concluding in the first week, or the first few days of March of 1934 prior to the

(Testimony of Chad F. Calhoun.)

time the bids were actually received by the District on May 22nd, 1934? A. Yes, I did.

Q. What did you do after the time that you turned over the papers that you have referred to to Mr. Larson?

A. I completed an estimate on all of the outside work. By the outside work I mean all of that work not incorporated in the tunnel construction proper.

Q. You had worked for Mr. Kaiser prior to February, 1934? A. Yes.

Q. How many years?

A. It was not a matter of years that I worked [522] directly for Mr. Kaiser. That particular term of employment commenced on January 2, 1934.

Q. In connection with this work particularly, or generally for his company?

A. Generally for his company.

Q. Do you recall whether you saw the plans and specifications for this work previous to the time you had the conference with Mr. Boggs which, I believe, was on the 17th of February, 1934?

A. It is my recollection that I did.

Q. Isn't is a fact, or don't you know as a fact, that the Henry J. Kaiser Company secured the plans and specifications from the District on the 31st day of January, 1934?

A. I don't know the exact date. I secured those plans and specifications, myself.

Q. You did?

(Testimony of Chad F. Calhoun.)

A. For the Henry Kaiser Company.

Q. The first set? A. Yes.

Q. That was secured?

A. That is right. I talked to Mr. Boggs about it over the phone about the exact time they would be available.

Q. After examining the plans and specifications that you had secured for the Henry Kaiser Company you then went and had this conference with Mr. Boggs?

A. Well, you speak of "this conference." I don't recall that I mentioned any particular conference. I think I saw Mr. Boggs several times.

Q. You testified this morning that you had a conversation with him and that after you finished that conversation with him regarding the financial set-up, breakdown of the estimate, etc., you went into another room and you copied these figures which you made the pencil memorandum of, and you have a date on there as the 17th of February, 1934. That is Exhibit No. 24, that I am referring to. Did you have any conference with Mr. Boggs prior to that date? A. I believe that I did.

Q. Referring now to the conference that you believe you had, when [523] was that with respect, how many days before was it with respect to February 17, 1934, when you copied what now forms Exhibit 24? A. Will you repeat that, please?

(Question read.)

(Testimony of Chad F. Calhoun.)

A. I will answer that in this way: It is difficult for me to recall the exact date except in this one instance, and that is the time which I copied the estimate which has been introduced here and this geological report. The reason I am so definite as to that date is because of the particular notation I made on my own notes at that time. These other conferences I am unable to state the exact time or day which they occurred.

The Court: Whether they were before or after, you are not prepared to say?

A. No, I am not, but I think most of them preceded or were right around that particular day, February 17th. I am quite confident of that.

Mr. Tinning: Q. You have no definite recollection of conversing with Mr. Boggs subsequent to that date of the 17th when you made these memoranda that you have here, after that time?

A. I don't have any definite recollection. I may have had, and I may have had some before.

Q. How long did you continue to work for Henry J. Kaiser or the Kaiser Paving Company, whichever your employer was at that time, how long did you continue?

A. Until December 1st, 1934.

Q. When did you complete your estimate of the outside work?

A. I had the estimate on the outside work virtually complete along towards the latter part of February or the 1st of March, with the exception

(Testimony of Chad F. Calhoun.)

of a good many sub bids, of course, which were necessary for the portal buildings, and some of the other work. It was completed later, following that, about the time of the second call for bids.

Q. By "completed later" you mean you secured the sub bids for [524] things like the ventilation buildings, and matters of that kind?

A. And the electrical work; matters of that kind —structural steel work and reinforcing steel, and matters of that sort.

Q. You recollect that the work items number 1 to 47, inclusive,—what we call the "outside work," —generally refer to—Do you know what they generally refer to?

A. No; I would have to look at that bid sheet to answer you definitely on that.

Q. I will show you Exhibit 14, Mr. Calhoun, and ask whether that refreshes your recollection on the outside work, with respect to Items 1 to 47.

A. Yes, that is right; Items 1 to 47. Well, however, I did prepare an estimate on the matters covered in Items 51 and 55.

Q. Mr. Tinning: And the witness points to Items 48 and 49, Tunnel Construction Type "A" and Type "B", and said "Not those."

The Witness: 48, 49 and 50.

Mr. Wittschen: Does he mean 51 to 55, or 51 and 55?

The Witness: Inclusive, yes.

(Testimony of Chad F. Calhoun.)

Mr. Tinning: Q. In order to understand the matter clearly, so the record will show it: You prepared an estimate of Items 1 to 47 and also Items 52 to 55? A. 51 to 55.

Q. 51 to 55? A. Inclusive.

Mr. Marrin: Is that inclusive, Mr. Tinning?

Mr. Tinning: Yes.

Q. What was the amount of your estimate of the outside work, Items 1 to 47?

A. That, I do not know at this time.

Q. What did you do with it?

A. I turned that estimate over to the W. A. Bechtel office.

Q. You turned it over to whom?

A. To the W. A. Bechtel office.

Q. It was turned over, I think you testified this morning—you gave certain papers to Mr. Larson; is that right? A. That is right. [525]

Q. This bid that you had prepared on these outside items was included with the other papers that you gave to Mr. L. M. Larson?

A. No; it was not; I did not turn that over until later.

Q. When did you turn it over, if you remember?

A. I believe it was around the latter part of April, 1934.

Q. To whom did you deliver it, if you recollect?

A. There were quite a few concerned at that time; I believe there was Mr. Larson, Mr. Hindmarsh and Mr. Shaw.

(Testimony of Chad F. Calhoun.)

Q. Mr. Calhoun, I asked whom you delivered it to—Do you recollect?

A. I was just answering your question, Mr. Tinning. I said there were quite a few concerned that were there in the room together, and I turned it over officially to the W. A. Bechtel Company.

The Court: He said there were three present.

Mr. Tinning: Q. Do you remember which individual you turned it over to? You say you turned it officially over to the W. A. Bechtel Company. Who got it?

A. Well, I am telling you all of those individuals were present when I turned it over. There may have been others there; but I remember definitely Mr. Larson, Mr. Hindmarsh and Mr. Shaw.

Q. Was your estimate larger than the bid that was put in by the Six Companies on May 22nd?

A. My estimate was the estimate of the bare cost alone of the construction of that work, and did not include complete overhead estimates, nor did it include any contractor's profit; so, consequently, it is a little difficult for me to answer your question.

Q. I assume, from your answer, that you intend us to understand that was added to the bid for profit and overhead; so the figures that you gave were less than the amount of the bid on those items which you estimated?

A. Well, I could not state definitely, without an actual comparison of the bid, whether that is so or not.

(Testimony of Chad F. Calhoun.)

Q. You do not remember any item of the 54 items that you estimated, [526] and upon which a bid was submitted by the Six Companies—you have no recollection, with respect to any item?

The Court: Read that question.

(Pending question read by the reporter.)

The Witness: A. Well, may I explain that? I submitted my estimate to W. A. Bechtel Company. At that time, they were forming the Six Companies of California that submitted the bid; just what was done with that estimate, I know some changes were made in the estimate which I submitted,—a good many changes were made at last—the exact figures that were used, I am not at this time familiar with.

Q. You said Mr. Hindmarsh, Mr. Shaw and Mr. Larson were present as the W. A. Bechtel Company representatives at the meeting where you turned over this estimate?

A. Well, at a meeting—it was informal, as things were always quite informal—just merely a trip I made to their office.

Q. This meeting was at the W. A. Bechtel Company office?

A. Yes—in the Stock Exchange Building here.

Q. Did you keep a copy of your estimate?

A. I did not keep a copy of it; but I turned a copy over to the Henry Kaiser Company.

Q. You have no copy of your own? A. No.

Q. You turned over a copy to your employer,—the Henry J. Kaiser Company?

(Testimony of Chad F. Calhoun.)

A. That is right.

Q. You continued with the Henry J. Kaiser Company, as an employee, until the end of 1934; is that correct?

A. No—Until December 1, 1934.

Q. Referring to Exhibit No. 24, Mr. Calhoun, as I understood it this morning you were not certain of the title—that the title on the exhibit which you have there,—"Broadway Tunnel, Engineer's Estimate of Cost, Joint Highway District No. 13," —was the same [527] title on the document from which you took the figures that you used in the last five columns on the page—

A. Is that a question?

Q. Yes. Whether I am correct in my understanding that you are not sure of the title?

A. I am not sure, particularly, of the exact wording of the title. I am sure of this: that this is a copy of the estimate supplied to me in Mr. Boggs' office,—a copy of the copy which we had previously discussed.

Q. Are you sure the title is a copy of the document from which you took the figures?

A. I have said, very definitely, I am not sure the wording is exact.

Q. In other words, when you say it is a copy of the estimate, you refer to the figures which you used for the estimate?

A. I refer to the figures, to the item numbers and to the description of the work.

Q. And the units were something you put in, yourself, after computation?

A. That is my recollection that I did, yes.

Q. I will ask you to look at this document which I hand you, and see whether that refreshes your recollection as the document which you saw on February 17, 1934.

A. Yes, that is. Mr. Tinning, it is not my recollection that the copy that I worked from was in that particular form. So far as the figures are concerned, I don't doubt that; but I mean—

Q. No; I am trying to see where the figures came from. A. Well, that is all right.

Q. I don't know what you saw at that time, Mr. Calhoun.

Mr. Tinning: Gentlemen, I don't care to encumber the record with a voluminous document. These figures Mr. Calhoun has taken and testified to, under Exhibit 24, apparently came from page 22 of the PWA application made by this District and filed on August 29, 1933, with the United States. We have checked the figures and the [528] units, and they are identical with those appearing on this memorandum of Mr. Calhoun's exhibit for the columns that he testified here—inserting the computations.

Mr. Marrin: Well, I have no objection, Mr. Tinning, to your putting that page in from the report, if you desire to; but I understood the witness to say that it was not his recollection that he copied it from a bulky document of this sort.

Mr. Tinning: No; I understand that. What I want to do is to have the record clear that the figures which he saw were the figures that were filed by the District with the United States on August 29th in connection with the grant application.

Mr. Marrin: Well, I would agree to this: that you may put in evidence, if you desire, the figures that appear in your application to the PWA, and you can draw any inference from that, upon the testimony of the witness, that you desire. I don't know whether he saw this or whether he saw something else.

Mr. Wittschen: He does not appear to know it. We could read those into the record.

Mr. Tinning: If your Honor please, we wish to offer as Defendant's Exhibit "A," page 22 from the application made by Joint Highway District No. 13 of the State of California to the United States PWA, Application No. 2231, which is a breakdown of the various quantities and estimates of the labor and material that would go into this job, and the figures on Exhibit 24 down to the total are identical with the exhibit we are now offering.

The Court: Let it be admitted and marked "Defendant's Exhibit "A."

(Document was marked "Defendant's Exhibit A.")

[Set forth in the Book of Exhibits at page 321.]

Mr. Tinning: I have no further questions.

Mr. Marrin: I have no further questions. [529]

Upon Appeal from the District Court of the United States for the Northern District of California, Southern Division.

PARKER PRINTING COMPANY, 545 SANSOME STREET, SAN FRANCISCO

LEWIS MICHAEL LARSON,

Called for the Plaintiff; sworn.

Mr. Marrin: Q. Mr. Larson, will you state your experience in construction work?

A. I began in the year 1900 with the survey party on the location of the present Salt Lake and Los Angeles Railway. I continued with that survey for three years; at the end of which time, I joined the Southern Pacific Company on its construction across the Great Salt Lake, remaining there until 1905, in the early part of the year, when I was transferred down to the tunnel work that was going on, or was about to begin, for the Southern Pacific on the Bayshore section. I was stationed at what was known as the Six Mile House, which is on the southerly end of Tunnel No. 4, and was given the position there of general foreman. My work comprised the tunnel work from that end of the town, followed with a fill of the part of the Bay which now forms the Bayshore Yard, some of the track-laying, the ballasting, and, after that was completed, the erection of the first unit of the terminal building. That carried me to November, 1911, when the Southern Pacific transferred me up onto the Willamette Pacific Cutoff from Eugene to Marshfield in the position of general foreman in charge of the bridge department for the Company. I remained at that position until 1916, when the Southern Pacific part of the construction was completed, and when the main bridges had been subcontracted, I mean, let out for sub-contract, I was appointed chief inspector. I continued in that po-

(Testimony of Lewis Michael Larson.)

sition until 1917, when the effect of the War caused the suspension of operations by the Southern Pacific in the construction department. In 1918, the Foundation Company of New York engaged me as their superintendent on their shipbuilding program at Tacoma and later at Victoria; completed in the last of 1919; in 1920 and part of 1921, I [530] engaged as a contractor in building operations in the City of Portland; in 1923, the Spring Valley Water Company engaged me as superintendent on the construction of the aqueduct in Niles Canon. That was completed that year. In that fall Mr. W. R. Fontaine employed me as superintendent of some work that he was doing for the Pacific Electric Railway of Los Angeles, Long Beach, San Pedro, and environments, in that vicinity, in the construction of retaining walls and trackage. During that period of time I estimated for W. R. Fontaine and Twohy Bros. Company the Hollywood tunnel, then known as the Hollywood Tunnel, now known as Subway Terminal Tunnel. When the award of the contract was made to them I was made superintendent. I remained with that work until its completion in the early part or possibly the middle of 1925, and as I now recall it at that time I engaged with W. R. Fontaine in the construction business as a partner. We built a bridge for City of Los Angeles, one for the Panama Petroleum Corporation, did considerable pipe and track work for the Panama Petroleum

(Testimony of Lewis Michael Larson.)

Corporation, for the Pacific Electric, and for some private individuals, and also I should remark water tunnels. At the completion of that work Twohy Bros. Company and W. R. Fontaine, who was associated with them, asked me to come to San Francisco and estimate the present Duboce, now known as the Sunset Tunnel. I completed the estimate of that tunnel, but Twohy Bros. decided not to bid on it because they were engaged in so much for the East Bay Utility District that they thought they had better confine their activities to the eastern shore of the bay. They engaged me to estimate the Claremont Tunnel for them, but the estimate that I turned in was not the one on which they bid the job and they were high. As referred to by counsel yesterday, the McDonald & Kahn people were successful, or, rather, the low bidders on [531] that work, and when they were relieved of it and the next lowest bidders were awarded the job I was employed as superintendent. I continued with them until 1926 or 1927, and if I recall correctly it was December, 1929 when that work was completed. In the spring of 1930 Mr. Mead asked me to join him on construction work on a salary and percentage, which I engaged to do. The first job we estimated was the Oyhee Tunnels in Oregon. We were not successful in landing those tunnels, and I made an estimate for him of the three first units of the Figueroa Street Tunnel in Los Angeles. We were

(Testimony of Lewis Michael Larson.)

not successful in getting that work. I estimated the sewer tunnel here in San Francisco for him, which he also did not get. The next was the Newcastle Tunnel at the City of Newcastle, for the California Highway Department, and as I recall it the next was the Wawona Tunnel, and that job we were not successful in landing. At that time the Packatowne engaged me to rebuild their plant at Bradley, California. That was sometime about the first of December, as I recall it now, in 1930. In 1930 Sydney Junkins Company of New York and Canada telephoned me, asking me to join them in estimating a tunnel under the city of Vancouver, B. C., that was being built for the C. P. R. The estimate was completed in the latter part of December, and I was engaged by Lindgren-Swinnerton people to estimate the Boulder Canon Tunnel, which the Six Companies later on received the award for and completed the job. My next association, I think, was with Merritt, Chapman & Scott. They asked me to construct three tunnels for them in the vicinity of Ventura, California, which I did, completing them, if I recall correctly, in the latter part of 1932. I then moved to Los Angeles and estimated for Lindgren & Swinnerton the Outlet Tunnel from San Gabriel Dam No. 1. That was followed [532] by an estimate of the Hetch Hetchy, the completion of the Hetch Hetchy Tunnels that were then being offered to contractors. After completing that my

(Testimony of Lewis Michael Larson.)

next estimate I think was this tunnel over here, under the Island, Yerba Buena Island, in connection with the Oakland-San Francisco Bay Bridge.

Mr. Tinning: Q. Mr. Larson, will you tell me who you did these various things for? The last one I think was Merritt, Chapman & Scott, and then Lindgren & Swinnerton.

A. Lindgren & Swinnerton on the Island Tunnel.

Q. What about the Hetch Hetchy?

A. The Hetch Hetchy was also for Lindgren & Swinnerton, and the Arundel Company of Baltimore, Silas Palmer and Barrett & Hilp. Following that I think my next was the estimate of the San Jacinto Tunnel of the Metropolitan Aqueduct, and the Metropolitan Water Company of Southern California, for a group of contractors who bid under the name of the Metropolitan Engineering Corporation. Following that—possibly I am a little out of order, but it is immaterial. Following that I estimated for the Walsh Construction Company the Val Verde Tunnel, the Bernisconi Tunnel, the Iron Mountain Tunnel, the Cottonwood Tunnel, and the Coxcomb Tunnel in the Southern California Water Department, known as the Metropolitan Water District of Southern California. I was then engaged by W. A. Bechtel Company to estimate for them the Broadway low level tunnel over here in Oakland, in No. 13 Highway District. As I recall it, my employment with them began on the 25th of February, 1934. I arrived from Los Angeles I believe upon

(Testimony of Lewis Michael Larson.)

the morning of the 26th and proceeded immediately to their office in the Stock Exchange Building, where I was given plans and specifications for this tunnel and directed by Mr. Stephen Bechtel, the President of the Company, to work in collaboration with Mr. Fontaine on the estimate of that work [533] particularly the tunnel.

Q. Is that the tunnel, Mr. Larson, which is described in the contract and Plaintiff's Exhibit No. 3 which is involved in this case? A. Yes.

Q. Will you proceed to state what you did in making that estimate?

A. The first day I spent in reading the specifications and looking at the plans. If I recall correctly the next day in company with Mr. Fontaine I visited Mr. Boggs, the District Engineer, as the plans indicated that he was the engineer who was in charge of the work. It was important to have information directly from him in regard to his thought on various phases of the work.

Mr. Wittschen: So that there will be no mistake about the record, it is understood that the objection to this testimony of Mr. Larson will run in the same manner as it did to Mr. Calhoun's; in other words, we do not want to interrupt, knowing what the Court's ruling will be, but we will make the objection on all of the grounds stated to the testimony of Mr. Calhoun, starting with this last question.

Mr. Marrin: As I understand, your objection is to anything that Boggs said to him?

(Testimony of Lewis Michael Larson.)

Mr. Wittschen: On all of the grounds stated to the previous questions.

The Court: Let the record show the objection and it will be subject to the same ruling, motion to strike, and an exception.

Mr. Marrin: Will you proceed?

A. I do not recall the exact date, but it was probably about February 22 that I called in company with Mr. Fontaine on Mr. Boggs and told him that the purpose of our visit was to discuss the project in a general way, and if I remember particularly at this time the thought developed in my mind that I would like to have a little clarification on the concrete method, and I asked Mr. Boggs if [534] we were successful in getting the bid could we pour the lean or concrete with the main part of the lining? Further in the specifications I had noticed the walls were boarded up to point not lower than seven feet, that is, the meeting line of the arch and that arch section, and at a later time I asked Mr. Boggs if there would be any objection to pouring it at one time, and he said there would be none. In looking over the plans I had noted that the long radius formation of the side walls from the radius of the arch gave the tunnel position a sort of battered position, that is, it kind of sloped in; that had an important bearing in a way when connected with the other items in the specifications in helping me to form a conclusion. I drew from that the conclusion that it was reasonable to esti-

(Testimony of Lewis Michael Larson.)

mate from the type of construction that no inordinate pressures might be expected from the side on account of the shape of the tunnel.

Mr. Tinning: If your Honor please, I move that the last answer of the witness go out as a conclusion and not responsive.

The Court: The conclusion may go out.

Mr. Marrin: Q. Will you state just at this time what you did, confining your testimony to what you did and said to the District Engineer or to his representative?

A. Not any conclusions that I drew, do I understand.

Q. No, not at this time. I will ask you about those later.

A. Well, in this discussion I think we asked—I say "we," because Mr. Fontaine accompanied me,—Mr. Boggs about the general lay out of the project. He told us where the tunnel began and about where it ended, and directed us to go out to see Mr. Gelston, whom we would find at the east end of the proposed tunnel. We drove out over the old Tunnel Road, through the old tunnel, and down to the point indicated by Mr. Boggs, and saw Mr. Gelston. Mr. Gelston explained— [535]

Mr. Wittschen: Pardon me. I think the question has been answered. He is about to give conversation.

The Court: Proceed by question and answer.

(Testimony of Lewis Michael Larson.)

Mr. Marrin: Q. What did Mr. Gelston tell you?

Mr. Wittschen: Objected to as immaterial, irrelevant, and incompetent, and not binding upon the District, calling for hearsay, and not bearing on any issue in this case.

The Court: The objection will have to be sustained.

Mr. Marrin: Q. Who was Mr. Gelston?

A. We did not have any definite information as to who Mr. Gelston was, but drew the inference from Mr. Boggs—

Mr. Tinning: I would like to take exception to that.

Mr. Marrin: Q. What did you do then?

A. Could I refer again—

The Court: Q. What you, yourself, did.

A. I viewed a test pit that had been dug sometime prior, just how much prior to the visit I do not know, but it was in the vicinity of the present Claremont Avenue Bridge and portal building. It was a test pit as I recall it now approximately four feet square and possibly eight feet deep; I could not tell you how deep, it had some water in it. The indications on the wall of that pit were that the ground was firm, it was in what is known as Orindan formation. I am a little lost on the limitation there.

The Court: You can state what you, yourself, did at that time.

(Testimony of Lewis Michael Larson.)

A. I looked over the project or the physical aspects in a general way on the east end.

Mr. Marrin: Pardon me just a moment. Are you willing to stipulate that Mr. Gelston was the Assistant Engineer of the District at that time?

Mr. Tinning: Yes.

Mr. Marrin: In view of that stipulation I am going to ask [536] the question again as to what Mr. Gelston said to you when you saw him at the east end of the tunnel.

Mr. Wittschen: Objected to on all the grounds previously stated.

The Court: I will allow it, it is preliminary under the same rule that I allowed the other, and an exception.

Mr. Wittschen: Note an exception.

The Court: So that either side is not misled to your injury, and I cannot conceive you can be injured, since you have made your objection, but if you want a final ruling on this testimony and insist upon it I shall rule. But, as I indicated to you, what I do, not only in this case, but in the other ones, both sides are protected legally upon the record and you do not waive any right.

Mr. Wittschen: I understand that at a later time we may argue it.

The Court: All right, proceed.

Mr. Marrin: Q. Will you state, Mr. Larson, what Mr. Gelston said at the time you saw him at the east end of the tunnel?

(Testimony of Lewis Michael Larson.)

Mr. Wittschen: I interpose the objection to all of these questions; I will make the same objection to that on all the grounds stated.

The Court: The same ruling, and so that the record may be protected note an exception following it.

Mr. Wittschen: Exception.

Mr. Marrin: Proceed, Mr. Larson.

A. As I recall the conversation Mr. Gelston merely indicated that this test pit had been dug at that point for an observation, to determine what the ground conditions might be. He indicated or said that the water that was in the bottom of the pit might be rain water, it might be overflow from an adjacent creek. That is my recollection of the conversation. I pointed out to Mr. Fontaine, who was [537] less familiar with the Orindan formation than myself, some exposures of the Orindan, and made an arrangement later on for a further inspection of the Orindan formation at a future date. At the termination of this investigation at the portal at this particular time we drove back through the old tunnel, and it is my recollection at the present time that we parked our car at the portal of the old tunnel on the east end.

Mr. Marrin: Q. Can you state where the location of that old tunnel is, relative to the tunnel which is involved in this contract approximately?

A. Yes, it is a little bit to the east of the present

(Testimony of Lewis Michael Larson.)

low-level Broadway Tunnel, and at an elevation, I should say, between 200 and 300 feet higher. That could be determined, however, from the data. The reason I was interested in it was it passed through a formation that would be a very similar formation to a large portion of the formation that appeared that the new tunnel was going to be projected through. If my recollection is correct we parked our car at the east end of the tunnel, and walked in to make the inspection on this particular day of the formation. I noticed that at each portal that the timber was depressed a little bit, and at the point if there had been a material weight on it the tunnel would have collapsed.

The Court: That is the old tunnel?

A. In the old tunnel. There was very little evidence of much repair work, indicating to me that there must have been very little weight. I appreciated that this depression of the timber might come from a development of weight with years passing by and the wash of material, and it also indicated that there could not be very much of a menace in the formation, otherwise the tunnel would have collapsed. In the major portion of the tunnel which lay in what is, I understand, Chert formation, there was lagging overhead, that is, it was covered with timbering and checks, and over those checks [538] were timber that are termed lagging, and over a portion of the side, all of the side could not be seen, but there were long stretches in there where you

(Testimony of Lewis Michael Larson.)

could see the formation, and there were places there where there had been no attempt at all at lagging other than to prevent spalling into the traveled portion of the tunnel, and you could make a fairly good inspection of the formation in that section. I noted and mentioned to Mr. Fontaine that there was no weight on there and no maintenance, that is, no replacement timber during the period since the tunnel was constructed, which I understood was in 1903. We then got back into our car and proceeded through this old tunnel and parked at a wider place in the road west from this old tunnel. Mr. Gelston there told us that there was a test pit over the future tunnel from 100 to 150 feet down the grade from the crossing of this old Tunnel Road. He did not take us down there, but Mr. Fontaine and I went to look at it. The test pit was apparently about six feet in diameter at the top, possibly two feet at the bottom, and I formed the idea at that time that it would not exceed 8 feet deep. The formation was badly broken and we could form no conclusion as to the character of the material that might be encountered in the tunnel, and we proceeded back to our cars. We then drove down the Tunnel Road to a point where there was a side road that led into the west portal of the projected tunnel. At that point we parked our cars again and walked along the old road. Mr. Gelston pointed out such parts of the construction as were visible from that point.

(Testimony of Lewis Michael Larson.)

I might mention here that our thought was to look at a drift or a small tunnel that the specifications had mentioned had been driven in that drift. I wish also to state at this particular time, because it has an important bearing, that I will bring out later, that there was also a geological report that could be read [539] in the District Office. We proceeded to the proposed location of the tunnel. Mr. Gelston pointed out about where the tunnel portals would be. We went up on the ground over the tunnel in the vicinity of the portal with a view to try and determine if we could what the formation might be in the tunnel. I noted a creek running over what would probably be near the portal of what is now, I think, termed the South Tunnel, it was the up-grade tunnel. At that time there was not a great amount of water pouring over it, but the wash in this creek indicated that there would not be much trouble in cutting, I mean that the material was not of that nature where it could be readily removed by the flowing water; from the North Tunnel Portal, on the bluff of the hill, the hill had slid away there and it had a high elevation above the south tunnel, and I tried to form a conclusion there by going around in the rock and seeing whether that was the natural formation; there was nothing really definite that could be determined from it, though it did not appear to have been very much disturbed over that tunnel. We then proceeded to this drift

(Testimony of Lewis Michael Larson.)

that I mentioned, and I noticed that there had been some retimbering done at the portal of this drift which Mr. Gelston explained had been placed there for the safety of people who would wish to look into the drift; that some of the previous timbers had collapsed. It was noted part of the wash from the creek that I have mentioned over the South Portal apparently would reach that location when the water was high and had a sort of muddy body. On the left-hand side of the portal of the tunnel I noticed the formation that had withstood erosion for no one knows how long, and it gave the impression it was a very hard formation. We went on to the tunnel, Mr. Fontaine and I did, with a view to trying to determine what formation we would find there, and make such other observations as were pertinent, [540] among other things the appearance of the timber, which was thought necessary by the District to hold the tunnel. My recollection now is, although it may not be correct, it was 6 by 6 posts and 6 by 6 caps, and the side and the top were lagged, that means they had lumber outside of the posts and over the caps to prevent the material from falling into it. As we proceeded further into this drift we found that the lagging was becoming less frequent, and toward the deeper part of the drift and the sides my recollection is for a distance of probably 20 or 30 feet there was no lagging. I tried to remove some of the material by hand and found that I could not do so, and we hunted around

(Testimony of Lewis Michael Larson.)

for something to check it, as to what the texture of the material might be. In the forward end of the drift I found a rock that probably was half the size of my hand, which I took out and took with me with a view to observing the texture. Mr. Gelston stated that this tunnel was in line with the future down-grade tunnel at an elevation of approximately 15 feet above sub-grade.

Q. Mr. Larson, I show you a map which has on it "Map Showing Location of Prospect Drift Driven in 1932 at Site of West Portal." Does that map show the location of that drift?

Mr. Wittschen: In order to preserve the record we make the same objection to all of these extraneous matters that are no part of the plans and specifications, as entirely immaterial, irrelevant, and incompetent, and endeavoring to change the contract by parole evidence.

The Court: The same ruling.

Mr. Wittschen: Exception.

A. That is approximately the location as I recall it. It has the relative location with the North Tunnel, the down-grade tunnel that I observed at that time, and about the same distance [541] from the portal, as I recall it.

Mr. Marrin: I would like to offer that in evidence.

The Court: It may be admitted and marked.

(The map was marked "Plaintiff's Exhibit 25.")

[Set forth in the Book of Exhibits at page 260.]

(Testimony of Lewis Michael Larson.)

Mr. Marrin: Q. Now, Mr. Larson, will you point out to the Court on that map where this prospect drift was with relation to the portal of the tunnel?

A. As I recall the drift—this is the portal of the tunnel, the west portal; this section is about 50 feet in length; that was approximately the end of the drift as I understand it at that time; that is the forward position of the drift, the drift being about 125 feet long. The portion I spoke of, prior to that, where this hard formation lay on this side, and the portion where the timbers had caved in, lay in this position here. Does that cover the ground? [542]

Mr. Marrin: Q. Yes. What subsequently was done with this area in here in which this prospect drift had been driven?

A. That was known as the approach cut, and was later on excavated by Subcontractors McKinley and Crowell.

Q. The prospect drift did not extend into any part of the tunnels as they were subsequently excavated?

A. No. There was no evidence of them there. When the excavation of the approach cut was completed, the prospect drift was entirely obliterated.

Q. What did you next do, Mr. Larson, in connection with—

A. Perhaps I should mention that my impression of the material that would be encountered was

(Testimony of Lewis Michael Larson.)

that it would be very firm. The drift, in other words, was—

Mr. Wittschen: I ask the volunteer statement go out.

The Court: It may go out.

Mr. Marrin: I think, your Honor, this witness is qualified to express opinions concerning those matters.

The Court: Well, that was a voluntary speech.

Mr. Marrin: Q. Would you tell us, Mr. Larson, the impression of the formation which you got from this inspection—

Mr. Wittschen: We object to that as incompetent, irrelevant and immaterial.

The Court: Objection will be overruled and subject to the same motion.

Mr. Wittschen: Exception.

The Court: Subject to a motion to strike over the objection of counsel, it will be received.

Mr. Wittschen: Exception, please.

The Witness: A. My impression is: the formation we would encounter in the tunnel would be a very satisfactory material.

Mr. Marrin: Q. Based on your examination of this drift?

A. Based on my examination of this drift; and there was an [543] apparent wash in the creek above and the general slope of the material over the North Tunnel, indicating that, if there were any deposit on there, it would be of a minor depth, because it would have a flatter slope.

(Testimony of Lewis Michael Larson.)

Q. Will you state what you did, next, in connection with making the estimate?

Mr. Wittschen: To which we will make the same objection.

The Court: The same ruling.

Mr. Wittschen: Exception, please.

The Court: Q. What did you do next?

A. I left this tunnel drift in the company of Mr. Fontaine and Mr. Gelston; and, as we proceeded through the old tunnel, different features of the work were pointed out by Gelston to us. The next trip—Maybe I better carry my trips separately in my estimate, for the time being. The next trip there was made in company with Mr. Fontaine; and, as I recall it, two or probably as much as four days later; for the purpose of further examining formations that we were likely to encounter in the tunnel drift. On this trip, we went over practically the same ground that we had on the previous one, with the exception we did not go into the drift, as our first inspection had been very thorough on that; but, in this trip, I took Mr. Fontaine down—or, rather, in this case, I should say up to what was known as the old Fish Ranch Road. We passed up over the divide and, on going down toward Berkeley, we ran across some relief workers who were widening the road which has now become known as the Claremont Avenue Extension. I had in mind showing Mr. Fontaine exposures of Orindan formation that must lie on that road. We were fortunate in finding these re-

(Testimony of Lewis Michael Larson.)

lief workers far enough advanced on their work that they had made many exposures of Orindan formation, and that gave us an opportunity,—a good opportunity,—to view [544] it in its different component parts. It is made up from river deposits; and, in river deposits, we have sometimes gravel, sometimes mud. That was clearly indicated in this formation. We drove back over the old Tunnel Road, and decided we would call on Dr. Louderback, on this trip; which we did, at his office at the University. We stated to——

Mr. Wittschen: Just a moment. Are you going to another conversation now? I would like you to ask another question.

Mr. Marrin: Yes.

Q. What did Dr. Louderback say to you at the time you called there?

Mr. Wittschen: We object to that as incompetent, irrelevant and immaterial, and calling for hearsay, and not binding on the District in any way, and not explaining plans and specifications.

Mr. Marrin: Will you stipulate Dr. Louderback is the man who made the geological report?

Mr. Wittschen: Yes.

The Court: Well, the report will have to speak for itself.

Mr. Wittschen: It is in evidence.

Mr. Marrin: I want to show, and offer to prove, by this witness, your Honor, that Dr. Louderback told him he had made the report and that, also, he

(Testimony of Lewis Michael Larson.)

referred them to a chert formation on the Claremont Road, which they examined.

Mr. Wittschen: Nowhere in the plans and specifications does it say bidders should go out and consult Dr. Louderback or anybody else on the side.

The Court: The objection will have to be sustained. The report is in, and we will have—and will have to speak for itself.

Mr. Marrin: Very well, your Honor.

Q. What did you then do, leaving out the conversation with Dr. Louderback?

A. I went to look at the chert exposure down on the Fish Ranch Road. After having seen that, in company with Mr. [545] Fontaine, I returned to San Francisco to the Bechtel office. I had one more subsequent visit—We made one more subsequent visit, rather, in which we were accompanied by Mr. Stephen Bechtel, by Mr. Kenneth Bechtel, by Mr. W. A. Bechtel, Junior, by Mr. Henry Kaiser—When I say "we", "we" means Mr. Fontaine and myself. We took them over practically the same ground that I have described, and when we came to the drift, I took Mr. Henry Kaiser into the drift to show him the formation there. My recollection is: there was nobody else besides Mr. Kaiser and myself that went in at this particular time. During this period, when I was not visiting, I was in the process of estimating the tunnel, the first of which is a careful survey to discover everything I can; and the takeoff of material and the quantity that there is to take

(Testimony of Lewis Michael Larson.)

into consideration. In the taking off of material, it is necessary to get prices on the materials that have to be purchased. As this takeoff was completed, I passed that information to Mr. Orselli. He was one of the members of the W. A. Bechtel Company, who was to assist me in checking extensions on my figures and my totals, and to get me the information that was necessary for me to complete the estimate of getting material price quotations. When the quantities were pretty well taken off, I began on the real estimate itself, and, as the worksheets were completed, I passed them to Mr. Fontaine, if he were present. Mr. Fontaine had many duties, and sometimes he was not there when I had a worksheet completed; in which event, I passed the worksheet to Mr. Orselli, and Mr. Fontaine would have the opportunity of observing it later. Mr. Orselli, in turn, passed the information to Mr. Shaw, who was then acting as chief engineer for W. A. Bechtel Company. That was the information I had. He brought it up into book form, in the way the W. A. Bechtel Company wished it placed.

Q. Mr. Larson, I show you Plaintiff's Exhibit No. 22, which is [546] entitled "Geological Report," and I will ask you to look at that and state whether, in connection with making the estimate, you examined that report, or any part thereof.

Mr. Wittschen: May I have the answer "Yes" or "No"?

(Testimony of Lewis Michael Larson.)

Mr. Marrin: Q. Will you say "Yes" or "No" to that? A. Yes.

Q. Which part?

A. The part beginning here on page 13.

Q. And running through to what page?

A. Running through and including page number 18.

Q. I also show you, Mr. Larson, Plaintiff's Exhibit 23, which is a profile, and ask you, in connection with the making of the estimate, whether you saw that profile.

A. I did. I had possession of both that and that portion of the geological report I refer to here.

Q. When did you first see the part of the geological report which you have stated you had before you, in making this estimate?

A. My recollection is that it was in the early part of——oh, before the 10th of March; it was March, because I did not join with them until February; so it was in the early part of March.

Q. Of what year? A. 1934.

Q. Did you have the profile before you?

A. Yes; I had this profile or one similar to it, yes. It was handed to me by Mr. Calhoun.

Q. Was that part of the geological report, which you have identified as having been before you, handed to you by Mr. Calhoun? A. It was.

Q. Did you read that part of the geological report which you had? A. Very carefully.

(Testimony of Lewis Michael Larson.)

Q. Did you draw any conclusions from that, as to the character of the ground through which the tunneling would be constructed?

Mr. Wittschen: I object to that as incompetent, irrelevant and immaterial, and not binding on the defendant in this case, and expressing something not considered by the contract between the parties.

The Court: Objection overruled. I will allow it to come in [547] over your motion to strike and over your objection.

Mr. Wittschen: Exception, please.

The Witness: A. I formed very definite conclusions.

Mr. Marrin: Q. Will you state what they were?

Mr. Wittschen: Same objection.

The Court: Same ruling.

Mr. Wittschen: Exception.

The Witness: A. My understanding of the report was that, in the major portion of both tunnels the ground would be self-sustaining. To me, "self-sustaining" means no need for artificial support. I noted, in the western portion of the tunnel, over the western portal, that we might find some wash, and we might find water that would be a sort of menace until we got under the main portion of the ground; and I noted that the slope of the hill indicated in the sketch would throw the tunnel under the undisturbed portion of the ground pretty quickly. I noted in the report, as I understood it, that not much trouble might be expected from this material.

(Testimony of Lewis Michael Larson.)

Those were my conclusions from having carefully studied the report, and the sketch that accompanied the report. On the basis of this, I proceeded to lay out the method of driving; that would be the excavation, in the western portal section——

Mr. Marrin: You are getting to another subject.

The Court: We will take a recess.

(After Recess)

Mr. Marrin: Q. I draw your attention to a photograph, which is on the easel. Will you explain what that represents?

A. That represents the chert exposure to which I made reference. There have been some changes. This was in a sort of arched condition, as I saw it; I could not tell; but I suppose it is——

Mr. Wittschen: We canot hear the witness. [548]

Mr. Marrin: Q. That was the chert exposure which you saw?

A. That was the chert exposure that I saw, and the one to which I took Mr. Fontaine.

Mr. Marrin: We offer that in evidence.

Mr. Wittschen: We object to that as incompetent, irrelevant and immaterial, and not being in any way binding on the defendant.

The Court: I will allow it under the same ruling.

Mr. Wittschen: Note an exception, please.

(The document was marked "Plaintiff's Exhibit No. 26.")

Mr. Marrin: Q. Mr. Larson, I draw your attention to Plaintiff's Exhibit 3, specifications for

(Testimony of Lewis Michael Larson.)

construction of project. I think you have already testified that you studied those specifications in connection with the making of your estimate?

A. I did.

Q. Did you form any opinion of the condition of the ground which would be encountered in driving the tunnel, from your study of those specifications?

Mr. Wittschen: We object to that as incompetent, irrelevant and immaterial, and calling for his conclusion on a matter that could not possibly bind this defendant.

The Court: Let it come in, subject to a motion to strike and over your objection.

Mr. Wittschen: Exception.

The Witness: A. Yes, I did.

Mr. Marrin: Q. What?

A. The impression that I got from the specifications was——

Mr. Wittschen: Just a moment. I want to make the same objection, but add to it, further: the specifications speak for themselves and are to be construed by the Court, and not subject matter calling for the opinion and conclusion of this witness.

The Court: Will you make reference to the part of the specifications you base your judgment or opinion upon? [549]

Mr. Marrin: I am going to ask him that at this time.

The Court: Ask it directly.

(Testimony of Lewis Michael Larson.)

Mr. Marrin: I am asking for the opinion, your Honor, that he formed as to the ground condition there of the tunnel.

The Court: Based on what?

Mr. Marrin: Based partly on these specifications.

Mr. Wittschen: What particular part do you claim to be misleading in any way?

Mr. Marrin: I was going to follow that by asking him that.

The Court: That was the reason I suggested it. Proceed.

Mr. Wittschen: Exception.

Mr. Marrin: I am going to ask him to draw our attention to the specific provision upon which he relied in forming his conclusion.

Q. Will you state, first, the opinion you formed as to the ground conditions, from studying those specifications?

Mr. Wittschen: I object to that as incompetent, irrelevant and immaterial, too general, not binding on the defendant, and asking him to interpret the specifications, which should be interpreted by the Court.

The Court: He may answer "Yes" or "No," if that is possible, and then follow it up by indicating what portions of the specifications he based it on. That is my suggestion. I will allow it, subject to a motion to strike and over your objection.

Mr. Wittschen: Exception.

(Testimony of Lewis Michael Larson.)

Mr. Marrin: Q. Will you answer the question?

A. I was influenced by the clauses in the specifications.

Mr. Wittschen: I move the answer go out. We are not interested in whether he was influenced. They are charging us here with having something misleading in the specifications. I think he ought [550] to point to something that misled him; and it is for your Honor to decide whether that was misleading.

The Court: I have allowed the question, preliminarily, under the issue presented of what will follow—the purpose of his testimony; if the purpose is what counsel has indicated.

Mr. Marrin: The purpose of this testimony is to show, first, that, from certain provisions in the specifications, self-supporting ground is indicated; the provision respecting timbering, and other provisions in the specifications; secondly, showing that that was a misrepresentation of the conditions, first —and, secondly, it goes to the issue of mistake.

The Court: Well, then, we will have to go to the provisions of the specifications to ascertain in what manner you were misled, if at all.

Mr. Wittschen: I would respectfully like to urge that I think this goes to a very important portion of the case; and I don't think those specifications are open to the interpretation of employees of the plaintiff to say that they were misled by them, unless your Honor concludes, from an interpretation, that they are misleading. You cannot draw infer-

(Testimony of Lewis Michael Larson.)

ences from specifications, and say, from those, that there was something in there that was misleading or deceptive, at least not in a general way, until he points out specifically the place he relies on. Then, I say, when that happens, it is for your Honor to interpret that language and not for the witness.

The Court: It might be that; that is the reason I suggested it.

Mr. Marrin: I will withdraw the question.

Q. Mr. Larson, will you point out the provisions in the specifications upon which you placed reliance in determining the ground conditions through which the tunnel would be constructed? [551]

Mr. Wittschen: I object to that as incompetent, irrelevant and immaterial, too general, calling for an opinion and conclusion of the witness on an immaterial point, and calling for a conclusion that is not binding on the defendant.

The Court: I will allow it.

Mr. Wittschen: Exception.

Mr. Marrin: Q. Will you proceed?

A. May I read it?

Q. You may call our attention to the specific provision, pointing out the page and the specification number, and read it.

A. May I state why I drew the conclusion?

The Court: Q. First indicate the specification.

Mr. Tinning: Q. And, Mr. Larson, will you give us the page and the section number?

(Testimony of Lewis Michael Larson.)

A. It is on page 59, in the section termed "Overbreak." I will read:

"Where timber is employed for tunnel timbering it shall be removed before any concrete is placed, and any spaces outside the neat lines of the concrete structure caused by such removal shall be filled with concrete as above provided. In the event that it is found impracticable, in the opinion of the District Engineer, to remove timbering or portions thereof, such timbering may be allowed to remain permanently in place, but in no case shall such timber so remaining be allowed to project into the neat lines of the concrete structure. Where timber is permitted to remain, all spaces outside of the neat lines of the concrete structure shall be filled with concrete mixed in the same proportions and placed at the same time as the concrete in the neat structure."

The Court: Q. That is to say the engineer was to determine that?

A. Yes, the engineer is to determine it.

Q. He had the final word, under the plans and specifications?

A. Yes; that is correct. [552]

On page No. 60, the paragraph at the right hand side of that page, under Section 32. I might drop back and repeat the whole clause there beginning with "Timber."

Mr. Tinning: I have a different paper if you indicate the subject-matter that will help a lot, Section 32 (e), is it not?

(Testimony of Lewis Michael Larson.)

A. Section (e), yes. The title is "Timbering". "The term 'Timbering' as used herein shall include all wooden pieces or structures used to support the earth or rock adjacent to any excavation. The Contractor shall furnish, put in place, construct and maintain all timbering necessary to support the sides and top of the excavations, preliminary to the placing of the concrete lining. The timbering shall be so constructed as to prevent any movement or caving which might in any way injure the proposed structures or endanger any person. Wherever, in the opinion of the District Engineer, sufficient or proper timbering has not been provided, the Contractor shall furnish additional timbering; but neither compliance with the District Engineer's instructions nor failure of the District Engineer to give such instructions shall relieve or release the Contractor from his responsibility for the sufficiency of the timbering.

"It is the general intent of these specifications that all timbering shall be removed from the excavation before concrete is placed. Should conditions arise where, in the opinion of the District Engineer, it is impracticable to remove certain timbers or structures, such timbering, upon the written consent of the District Engineer, may be permitted to remain, subject, however, to the provisions herein contained in respect to clearances outside of the concrete lining. Timbers allowed to remain in place shall in no case project into the neat lines of the

(Testimony of Lewis Michael Larson.)

concrete structure, and, in the event that it is apparent, during the process of excavation and timbering, that the safety of the [553] excavation will require timbering to remain in place, the Contractor shall enlarge the excavated section to the extent necessary to set the timbers outside of future concrete lines; timbers found to project within the concrete lines shall be removed and reset before concreting. Permission to allow timbers to remain will not be granted for any other reason than to secure the safety of the structure.

"Where timber is allowed to remain it shall be keyed or wedged firmly against the adjacent rock or earth, and shall be securely fastened, spiked or bolted so that no movement, shifting or settlement shall occur. All joints shall have full and firm bearing, timber to timber, without shimming or blocking. All timber, whether permanent or temporary, shall be sound Douglas fir and no second-hand material shall be used, provided, however, that material already used in tunnel construction and removed in good condition, may, with the approval of the District Engineer, be reused where conditions permit.

"Timbering shall be placed in such a manner as to be readily removed, without endangering the safety of the excavation or causing weakness or excessive stresses in adjacent timber sets or concrete structures, and any damage which may occur shall be remedied by the Contractor at his own expense, including the removal and replacement of any con-

(Testimony of Lewis Michael Larson.)

crete which has, in the judgment of the District Engineer, been damaged or subjected to excessive loads on account of such operations.

"Lagging behind timber sets shall be restricted to the least extent consistent with safety, and, if, in any case, permitted by the District Engineer to remain permanently in place, shall be so spaced as to permit the unrestricted flow of concrete through the lagging to fill any spaces between the lagging and the excavated surfaces." [554]

Mr. Wittschen: Would you mind reading the one as to Structural Steel Supports?

Mr. Marrin: I asked the witness to read those sections of the specifications upon which he based his opinion as to the nature of the ground.

The Court: The thought being not to limit him to any section or portion of the section?

Mr. Marrin: I did not want to limit him to any part upon which he based his opinion.

Mr. Wittschen: The next paragraph is Steel, and it is pertinent.

The Court: Q. Did you take that into account?

A. The steel?

Q. Yes.

A. I took it into account only in this way, that it was optional to use steel instead of timber, where the conditions demanded that one or the other might be used; it was optional. If I may be permitted to state——

(Testimony of Lewis Michael Larson.)

Mr. Wittschen: Just a moment, you have answered the question.

Mr. Marrin: I think so. Do not volunteer until I ask a question. Do you want the section read?

Mr. Wittschen: Yes.

Mr. Marrin: Will you read that?

A. It is entitled "Structural Steel Supports," Section (f): "Structural steel shapes may be used to support the sides and tops of the excavation, either entirely or in connection with timbering. Where structural steel ribs are used the same may be allowed to remain in place, provided that they do not project into the concrete more than four inches (4") beyond the neat lines of the concrete structure. The manner of framing, supporting and removal shall be such as to fully support the excavation while in place, and permit removal without endangering other parts of the structure. [555] All timbering used in connection therewith shall conform to the requirements set forth under 'Timbering,' including the removal before concrete is placed. Where steel is permitted to remain in place, all spaces between the steel and the adjacent earth or rock shall be thoroughly filed with concrete so as to provide firm and uniform bearing and the steel ribs and liners shall be so constructed and erected that no settlement or movement will occur. Liner plates allowed to remain in place shall not project into the neat concrete structure."

(Testimony of Lewis Michael Larson.)

Q. You might as well read the rest of it on timber and then we will have it complete.

A. "(g) Types of Tunnel Section.—Two typical tunnel sections are shown on the plans. The District Engineer shall determine which section shall be used in any specific location in order to meet varying conditions which may be encountered. In general, it is expected that the Type 'A' section will be used throughout the major length of the tunnels, but if conditions arise which, in the judgment of the District Engineer, require the use of Type 'B' section, the Contractor shall make such modifications in construction as may be necessary.

"No extra payment will be allowed on account of such change, but the unit prices bid for the various units or types of work shall include full compensation for such work, labor, material or equipment as may be necessary."

Q. What opinion did you form as to the condition of the ground from these provisions of the specifications which you just read?

Mr. Wittschen: Objected to as immaterial, irrelevant, and incompetent, and asking the witness to construe the contract, and invading the province of the Court.

The Court: I will allow it subject to the same ruling.

Mr. Wittschen: Note an exception. [556]

A. In order to make any estimate you have got to draw a conclusion on every part——

(Testimony of Lewis Michael Larson.)

Q. Just answer the question. Will you read the question?

(Question repeated by the reporter.)

A. That in the main the timbering would be required to be removed, which implied a self-sustaining rock.

Mr. Wittschen: I ask that the last portion of the answer go out.

The Court: The "implied' may go out. Develop the facts, whatever they may be.

Mr. Marrin: Q. From your experience in tunnel construction, could you state whether or not timbering could be removed where the ground is not self-supporting?

Mr. Wittschen: Objected to as asking for the opinion and conclusion of the witness, and endeavoring to construe the contract, and entirely immaterial.

Mr. Marrin: I think that he has the qualifications to answer as an expert. He has had long experience in tunnel work.

The Court: That may be true, but tunnels are driven under different conditions. We have plans and specifications here. His answer will have to be based on conditions here.

Mr. Wittschen: Might I call attention to the fact that the plans provide if the District Engineer insists it all will remain in.

Mr. Marrin: No, the plans do not quite provide that. They require the timbering in unless the Dis-

(Testimony of Lewis Michael Larson.)

trict Engineer, by order, requires them to be taken out, or permits them to remain in.

Mr. Wittschen: He can permit them to remain in.

The Court: As I gathered from the statement yesterday, the engineer had the final say as to whether they would remain in or be removed. In fact, they had to have his consent before removal.

[557]

Mr. Wittschen: No, they had to have his consent for them to remain, but if he wished to he could leave them all in.

Mr. Marrin: What I will offer to prove by this witness, so that it may be clear to your Honor, is this, that he was furnished with certain specifications and geological reports, and he made an examination of the ground, and conclusions which he arrived at in planning the method of procedure, and the cost of constructing these tunnels. Now, your Honor may or may not feel that he was justified in relying upon these things, but we think we are entitled to show this certainly on the issue of mistake, and the fact as to what the conditions were. We have to show that not only did the district furnish these things and make these representations, but that the plaintiff relied on them.

Mr. Wittschen: In that connection, in the first place, the district could not possibly be bound by what somebody interpreted in a set of plans. In the first place, it is for your Honor to determine

(Testimony of Lewis Michael Larson.)

whether or not they were misled, and in these plans and specifications the District could have had every stick of timber removed or every stick left in, depending upon how the Engineer of the District felt. Furthermore, on this issue of mutual mistake, if that is what counsel is trying to show, I say he is completely out on that, because the cases hold that mutual mistake must be pleaded, and under the form of common count you may show fraud if you like, you may show under a common count, particularly where the answer is in, any reply where a certain defense is set up; in other words, where we set up that the plans and specifications show so and so, they might come in and show that their bid was procured through fraud, but where they want to set a contract aside on the ground of a mutual mistake, there was a case decided within the last two months by the Supreme Court of this State, and I will just read one excerpt from it. There are other [558] cases on it.

"Where a cause of action if founded upon an alleged mutual mistake it is necessary that the complaint contain a proper allegation thereof."

Now, there is no element of mutual mistake here. What counsel started in to prove was that he was misled, or his client was misled by these specifications. Now, I say these specifications that require timbering in great detail, and this does not go to the weight of the evidence, it goes directly to the point, could not possibly mislead anybody that the

(Testimony of Lewis Michael Larson.)

ground was self-supporting, and where the District Engineer, under the evidence that is now in before your Honor, might order all timber out, or might permit it to remain, then I say it is for your Honor to determine whether or not these provisions are misleading, and not to have the gentleman who is on the stand say they misled me—whether they misled him or not is immaterial. The question is whether they mislead.

Mr. Marrin: We say that this witness was misled. He was the man that made the estimate.

The Court: Assuming that your position is correct, and his conclusion is it was misleading, I must finally determine whether or not he was misled, that is entirely for the Court—he was misled by what?

Mr. Wittschen: He said by this language, I assume was the question. But even if he was misled, that is not the criterion, but is the language misleading to a reasonable person?

The Court: Since I have indicated my method of procedure, I am going to allow them to make a record on that, and after a full cross-examination I will be in a position to rule. Proceed.

Mr. Wittschen: Note an exception.

Mr. Marrin: Read the question. [559]

(Question repeated by the reporter.)

The Court: Do you understand the question?

A. I believe I do, your Honor. It cannot be removed with safety unless the ground is self-

(Testimony of Lewis Michael Larson.)

supporting. It is one of degree. In some cases it would cause an immediate filling in, in other cases it might sustain itself for a very limited time, but it is an unwise risk to take.

Mr. Wittschen: Just a moment, I am going to move that the answer go out as being entirely immaterial, not entirely responsive to the question, and not proving any issue.

The Court: The objection will be overruled.

Mr. Wittschen: Exception.

Mr. Marrin: Q. Were there any other provisions in these specifications, Mr. Larson, upon which you relied in determining the method of procedure which you followed in constructing these tunnels?

Mr. Wittschen: The same objection to that as to a similar previous question, and the further objection that it is entirely immaterial what procedure he adopted. His principal agreed to build the tunnel, and to finish it, and the procedure that they followed was up to them.

The Court: I will allow him to answer.

Mr. Wittschen: Exception.

A. Will you kindly read that question again?

The Court: Read the question.

(Question repeated by the reporter.)

A. May I couple that, your Honor, with a conclusion?

The Court: You will have to answer the question.

Mr. Marrin: Q. Were there any other provisions of the specifications?

(Testimony of Lewis Michael Larson.)

A. Not that I recall at this time.

Q. Very well, that answers it. Mr. Larson, did you consider the [560] fact that the specifications provided for a construction of 200 feet of Type B and 5600 of Type A?

Mr. Wittschen: Objected to as asking the witness to construe the specifications which are for the Court. That provision was just read, and it reserves the right of the District Engineer to have it all Class B if he so desired.

The Court: Read the question.

(Question repeated by the reporter.)

Mr. Wittschen: My objection is that there is nothing in the specifications to warrant his conclusion. He just read into the record that the District Engineer could order it all Type A or all Type B.

The Court: He may answer the question.

Mr. Wittschen: Exception.

The Court: Do you understand the question?

A. I understand the question, yes. My conclusion was that the thought in the Engineer's mind would be that there would be a very limited amount of Type B.

Mr. Wittschen: Is he to interpret the Engineer's mind?

The Court: You cannot interpret the Engineer's mind. You would have some capacity if you could do that.

Mr. Wittschen: The answer may go out, I take it?

The Court: It may go out.

(Testimony of Lewis Michael Larson.)

A. I will have to admit that it did help confirm the conclusion in my mind that there would be a limited amount.

Mr. Wittschen: I ask that the volunteer statement go out.

The Court: It may go out. Read the question.

(Question repeated by the reporter.)

Mr. Wittschen: That is assuming something not in evidence, it did not so contemplate.

The Court: I am going to allow the witness to answer it if he can. [561]

Mr. Wittschen: Exception.

A. It did influence me in believing that there would be a limited amount, if that answers the intent of the question.

The Court: What do you mean by that?

A. A limited amount of the Type B which is the heavier type.

Q. What do you base that on?

A. I base it not only on the specifications, on the geological report—I had to combine all of those things to form the conclusion.

The Court: I think the question and answer may go out. I have tried to clear the matter up and cannot do so. You may reframe the question.

Mr. Marrin: I will withdraw the question.

The Court: We will take an adjournment now until tomorrow morning at ten o'clock.

(An adjournment was here taken until tomorrow, Thursday, April 14, 1938, at ten o'clock a. m.) [562]

Thursday, April 14, 1938;
10:00 O'Clock A. M.

Mr. Wittschen: Before the witness is called, may I have one technical matter corrected and have an understanding with the other side? I hurriedly read through a small portion of the record of yesterday's proceedings, and I know it is inevitable that transcribing and typographical errors will take place, but I have noticed several, and I think this stipulation is agreeable to the other side: that we may go through the record at our leisure, make certain corrections that we agree upon, and notify the Court; and, in the event we fail to agree, the Court can straighten out any errors.

On page 111, there is one matter that, from my viewpoint, is serious: I think your Honor will recall that I objected most vigorously to the introduction of the geological report, and your Honor recollects that I took an exception. No exception has been noted; and I would like page 111, at the place that that geological report was admitted in evidence, to note that the defendant took an exception to the Court's ruling.

The Court: The record will so show.

Mr. Wittschen: Would your Honor so order?

The Court: Yes.

Mr. Wittschen: There will be others. I have not had a chance to go further.

Mr. Marrin: If the Court please, preliminarily, the plaintiff has alleged that it was the holder of a contractor's license issued by the Contractors' State License Bureau of this state, at the time the contract was entered into and during all the time that it was ours; and I understand that the attorneys for the defendant are willing to stipulate to that.

Mr. Tinning: Yes, we will stipulate that you were duly licensed at all times during this contract.

[563]

Mr. Marrin: Yes. There is one other matter, your Honor, which I should like to refer to.

Mr. Tinning: May I say the reason for the stipulation is that the original license was lost in moving around, and that is why it is not produced?

Mr. Marrin: That is the reason. They were posted in the job office and became lost. In looking over the transcript of yesterday, I see the following statement which was made by the Court to the witness; and the witness's reply to the question of the Court is this—it is in connection with the discussion on timbering specifications:

"Q. That is to say the engineer was to determine that?

A. Yes, the engineer is to determine that.

Q. He had the final word, under the plans and specifications? A. Yes; that is correct."

At this time, we want to point out to your Honor that we do not agree with any statement that the

engineer had any right to interpret or change the contract, or that he had any arbitrary power under the contract, while the contract——

The Court (Interrupting): Yes; the Court did not intend to infer that he did.

Mr. Marrin: Well, I just wanted our position to be clear.

The Court: The only thing I was referring to—the thing in my mind was that it was stated by counsel on either one side or the other that he was, and the plans and specifications so indicated—the plans, rather. That was all I had in mind.

Mr. Wittschen: The specifications indicate he could determine whether or not timbering would be left in or taken out.

Mr. Marrin: There will be a great deal of testimony, later on, with respect to the power of the engineer, at which time we will [564] want to argue the matter; and I simply want it understood we don't agree that that is the situation, at this time, so you would not be misled.

Mr. Wittschen: Well, Mr. Marrin, I think each of us is apprised as to how far the engineer may go; but the Court's question is not directed to determining matters of policy by the engineer, but merely, on that item of timbering, that there was a clause in there that gave him discretion as to whether the timber could remain in or be taken out; and the clause will have to speak for itself.

Mr. Marrin: Yes; that is correct. Also, at page 172 of the transcript, I at first made a misstatement to this effect:

"No, the plans do not quite provide that. They require the timbering in unless the District Engineer, by order, requires them to be taken out, or permits them to remain in."

I corrected that statement, because it is not true. The plans provide, as Mr. Wittschen stated, that the timbering shall be removed unless the engineer permits them to remain in. The reporter did not get that correction. I simply want to clear that up.

Mr. Wittschen: I think probably I have not had the opportunity, as you have had, to read all of the transcript; and I have suggested, earlier, if there are any misstatements, they can be taken care of.

The Court: I think I am aware of the position of both sides. I don't think there will be any difficulty about agreeing on anything—wherever there may be a dispute in relation to it, if there is, you will have an opportunity to call witnesses to straighten it out, if there is any question about it.

Mr. Wittschen: We shall not be technical about it. [565]

LEWIS MICHAEL LARSON,

recalled for the *defendant;*

Direct Examination (Continued)

Mr. Marrin: Q. Mr. Larson, did you complete an estimate on the cost of constructing the tunnels which are described in the contract between the plaintiff and the defendant, which has been introduced in evidence here? A. Yes, I did.

Q. Before completing that estimate, did you form an opinion as to the character of the ground through which those tunnels would be constructed?

A. I did.

Q. What was that opinion?

Mr. Wittschen: Objected to as incompetent, irrelevant and immaterial, calling for an opinion and conclusion of the witness upon a matter that is not binding upon the defendant, and on the further ground that the defendant is not bound by the opinion or conclusion of any witness, but the contract and specifications must speak for themselves.

Mr. Marrin: If the Court please, there was a little confusion at the end of the day yesterday. We are offering this testimony to prove, not what the plans and specifications mean, or to determine them, but to prove a fact. That fact is the reliance of this plaintiff upon those representations. Whether or not the plaintiff was justified in placing that faith and reliance upon them will, of course, in the end be for the Court; but we want to prove, through this witness, and offer to prove through him, the fact of such reliance.

(Testimony of Lewis Michael Larson.)

Mr. Wittschen: The District, the defendant in this case, is not bound by the opinion and conclusion of any witness.

Mr. Marrin: That is not the point, your Honor, —as to whether they are bound. There is no attempt being made here to change the specifications or the contract. The only purpose of this testimony [566] is to show the reliance upon it,—which is a matter of fact; and which we feel we have a right to prove.

Mr. Wittschen: I would like to add to my objection: that it is a self-serving conclusion.

The Court: I will allow it, subject to the same ruling: subject to a motion to strike and over the objection of counsel.

Mr. Wittschen: Will you note an exception, please?

The Court: Note an exception.

Mr. Marrin: Will you read the question, please, Mr. Reporter?

(Pending question read by the reporter.)

The Witness: A. The opinion was that the major portion of both tunnels would be in self-supporting ground.

Mr. Marrin: Q. Upon what was that opinion based?

Mr. Wittschen: I make the same objection to that question as was made to the preceding question, and on all the grounds.

The Court: Same ruling.

Mr. Wittschen: Note an exception.

(Testimony of Lewis Michael Larson.)

The Witness: A. It was based on a study of the geological report, on a study of the specifications and of the plans, and upon an inspection of the physical features, by myself.

Mr. Marrin: Q. What provision of the specifications?

Mr. Wittschen: We object to that on all the grounds previously stated.

The Court: Same ruling.

Mr. Wittschen: Note an exception.

The Witness: A. On the provision of the specifications relating, to my understanding, that the timbering would have to be removed unless permission of the engineer was granted to allow it to remain in.

Mr. Marrin: Q. And what provision of the plans?

Mr. Wittschen: Same objection on all grounds stated. [567]

The Court: Same ruling.

Mr. Wittschen: Note an exception.

The Witness: A. That the plans indicate a wall, that we term a "batter wall," that led me to conclude that the ground would be offering no inordinate pressure to the side walls; that there was no plan of timbering offered, which is customary, I think, without any exception, in all the tunnels that I have estimated. When timber is to be left in, it is customary to offer a plan showing how the timbers should be left in.

(Testimony of Lewis Michael Larson.)

Mr. Wittschen: I ask that the opinion and conclusion of the witness, as to what is generally done in all tunnels, be stricken.

The Court: What is generally done in all tunnels——

Mr. Marrin: I think, your Honor, that should remain in; the witness is qualified as an expert; he is entitled to rely upon his previous experience, showing what is usually present where the timbering is to be left in the tunnel.

Mr. Wittschen: It was a voluntary statement.

The Court: After all, it will finally be determined, I take it, by the Court, after we have a complete picture. I will allow the record to stand, keeping in mind, as I have stated, it is going in, subject to a motion to strike, over the objection of counsel.

Mr. Wittschen: Exception.

Mr. Marrin: Q. Before completing your estimate, Mr. Larson, did you decide the method of procedure that you would follow, in excavating these tunnels? A. I did.

Q. Will you describe that method?

A. I had planned to go in, on each of the two tunnels, from the westerly side,—westerly end,—with 11 drifts for a distance of 40 feet; on the easterly portals, at each end, with 11 drifts in for a distance of 20 feet.

Mr. Tinning: Q. We cannot hear you, Mr. Larson. I think you started by saying there were 11 drifts?

(Testimony of Lewis Michael Larson.)

A. 11 drifts were planned [568] for the west end, to penetrate the tunnels for a distance of 40 feet; that would apply to each of the two west portals. The east portals, it was planned to drive 11 drifts to complete the outer excavation for a distance of 20 feet,—that is, the east portals, with these drifts. They are perimeter drifts. They are drifts that are driven in the outer excavated section; and timber to be put in,—planned to go in for 720 feet, by wall plate drifts. Should I explain the wall plate, or is it not a proper time?

Mr. Marrin: Q. I will ask you to describe that shortly.

A. And for the remainder of the distance, I had planned to use what I shall term the full face method,—putting up temporary timbers, removing them when the concrete was placed.

Q. From which end were the wall plate drifts; from which portals——

A. From the west end, adjoining the full drift sections.

Q. From which end did you plan to construct all of these drifts?

A. From the west end, with the exception of the 20 feet in the east end.

Q. I show you here a drawing marked "Excavation and Timbering." Will you state what that is?

A. That drawing shows three methods that I had planned to pursue in the driving of the tunnel; and it shows, at the ends,—east and west ends,—where it was contemplated to leave the timbers in.

(Testimony of Lewis Michael Larson.)

Mr. Marrin: I offer that in evidence.

(The drawing was marked "Plaintiff's Exhibit No. 27.")

[Set forth in the Book of Exhibits at page 261.]

Mr. Marrin: Q. Mr. Larson, will you just explain briefly to the Court the methods that you proposed to use and where they occur in the tunnel?

A. Yes.

Mr. Tinning: Yesterday, when Mr. Larson was testifying to some diagram, he was saying "This"; and I am sure the record won't show it.

Mr. Marrin: Yes; we will have to clear that up. We have four [569] wooden models, your Honor, to illustrate this witness's testimony, and I would like to get them.

The Court: We will take a few minutes' recess while you are placing them.

(Short Recess) [570]

Mr. Marrin: I would like to have marked for identification at this time, if your Honor please, this wooden model which I will mark with a "1".

(The model was marked "Plaintiff's Exhibit 28 for identification.")

I would like to offer for identification the wooden model which I will mark with a "2".

(The model was marked "Plaintiff's Exhibit 29 for identification.")

I would like to have marked this model No. 3 as Plaintiff's Exhibit 30 for identification.

(Testimony of Lewis Michael Larson.)

(The model was marked "Plaintiff's Exhibit 30 for identification.")

I would like to have the model which is marked No. 4 marked Plaintiff's Exhibit 31 for identification.

(The model was marked "Plaintiff's Exhibit 31 for identification.")

These models, if your Honor please, were prepared for the purpose of demonstrating the methods used in the actual tunnel construction, with the exception of this model which has been marked "Plaintiff's Exhibit 29 for identification," which was made to demonstrate the method of full face excavation which was contemplated but which was not used, and they are as accurate representations of the method used as we could produce from our records.

Now, for that purpose, if there is no objection by defendant's counsel, to their being placed in evidence, I would like to offer them in evidence for that purpose.

Mr. Tinning: My understanding, Mr. Marrin, is that they are accurate representations of methods that you proposed to use [571] or did use, and drawn to some scale in proportion to the plans of the tunnel, but that the actual timbers that are set in these models are simply demonstrative, and they do not purport to represent particular locations of any timbers that were actually installed in the tunnel?

Mr. Marrin: That is correct.

(Testimony of Lewis Michael Larson.)

Mr. Tinning: We have no objection, on that understanding, to your introducing them as exhibits to demonstrate the method, but not for the purpose of determining the dimensions or actual positions of particular timbers that might have been installed in the tunnel.

Mr. Marrin: We will offer them in evidence then as Plaintiff's Exhibits 28, 29, 30 and 31.

(The models were marked, respectively, Plaintiff's Exhibits 28, 29, 30, and 31, in evidence.)

Q. Mr. Larson, referring to Plaintiff's Exhibit 27, which is a chart, and to plaintiff's Exhibit 28, and to Plaintiff's Exhibit 29, will you explain to the Court from those the methods of excavation which you planned on using at the time you made your estimate?

A. Yes. This illustrates the drift method referred to.

Q. When you say "this" you are referring to the section AA on Exhibit 27?

A. This illustrates two lower drifts; they were to be driven in first to a certain distance, which I will elucidate more fully on the other model, to be followed then by the two drifts immediately above, and then two drifts above them, and continuing so until we reached the top drift, which completes the outer circle.

Q. Now, pointing to the plan of the tunnels, will you point out where it was contemplated by you that that method specified in Section AA would be used?

(Testimony of Lewis Michael Larson.)

A. 40 feet on this end of the two tunnels.

Mr. Tinning: Does that indicate the west end, for the purpose [572] of the record?

Mr. Marrin: Q. Does that indicate the west end?

A. This indicates the west end and this indicates the east end, 20 feet on the east end, or the upgrade end; from that position of 40 feet which is not definitely illustrated here, carried on to the top of these darker lines showing a contemplated wall plate section, which is this section here.

Q. In referring to the dark lines the witness is referring to the west end of the plan as shown on Plaintiff's Exhibit 27, and you are referring now to Section BB as shown in that exhibit?

A. Yes. In this it was planned to excavate this drift marked No. 1 on each side first, placing what we term a wall plate in there, which is a heavy stick of timber, from which we would construct as we progressively advanced with our excavation the arch section of the timbers to support the ground above. When this was excavated to a certain depth, probably 20 or 40 feet, and other wall plates are about ready to be placed in there, or, rather, I should say when it was advanced to the point where it was safe for men to work in this section marked 2-2, on each side, a crew was to be put in there and the muck from these drifts was to be dropped down into this lower drift; the reason for mentioning the safety of the men working below was this, as these two were

(Testimony of Lewis Michael Larson.)

advanced in about the same stage of progress, this final drift, known as the top drift, would be the one that would be excavated, and the permanent timbers put in, forming the arch and protecting the crews below. The next move was to make—these operations were to be carried on forward progressively in the steps I illustrated. We then go along and shoot the core—this section in here is known as the core, not enumerated by numerals 1, 2, 3, and as that core was being excavated this wall plate that I mentioned in the wall plate drift would overhang the excavation and posts would be progressively [573] placed under the overhung portion of the wall plate to give support to the timbers above as the earth was removed.

Q. How was that earth removed?

A. That earth was planned to be removed with power equipment, either air or electric shovels. Dropping back again to AA, it was planned to remove this core too by a power shovel, and after having completed the circle—I might mention that this was planned to be in advance of the concrete lining. This one marked CC——

Q. The witness is referring to Exhibit 27.

A. Of Exhibit 27—it was planned from the point where these wall plate drifts would end to carry that method through the entire length of the tunnel; that is what is termed the "Full face method."

(Testimony of Lewis Michael Larson.)

Q. The wall plating would end at the place indicated in Exhibit 27 where the cross hatching or shaded portion of the tunnel stops?

A. Correct, and where the unshaded portions are illustrated there the full face method was contemplated. In the full face method it was contemplated to put temporary timbers in to protect the workmen from falling rock, from dropping onto the workmen, but later on to be removed in advance of the concrete lining. The advantage in that lies that this section could have been made smaller, because the timber being removed, the timber could have been removed on the inside of the section to be lined by concrete, and being removed in advance it would reduce the section of concrete lining that we would have to put in there by at least one foot per tunnel foot, that is, one foot in width over the circle, a big circle of the tunnel from sub-grade to sub-grade, for the full length where this method was used.

Q. Now, referring to Section AA as shown on the plan, did you plan to leave the timber in that section?

A. We planned to leave the timber in this section known as Section AA, and in BB section. [574]

Q. You did not plan to leave the timber in the section CC? A. Only the lagging.

Q. Now, Mr. Larson, referring to Plaintiff's Exhibit No. 28, will you point out to the Court just how the excavation was carried on in these drifts,

(Testimony of Lewis Michael Larson.)

and as you go through will you explain what a wall plate is, and what segments are and what spiling and lagging is, so that the Court will understand from now on what those terms mean?

A. Yes. This is what we term the lower drift. If the ground conditions permit we make an excavation in a specified distance, which in my estimate I thought would be five feet in the spacing of those timbers, then the posts are put up. These are the posts and this is the cap put over the posts, and on the top of that we would put what we term lagging. Lagging is illustrated on this side. It is timber laid from set to set, or possibly covering two sets, depending on the ground conditions, and the lagging meets each other on the end; there is no over-lap; I mention that because there is a difference in that and spiling. If ground conditions are bad, instead of making your excavation first and putting your lagging in, you have to shove your spiling, either by what we term the method of advancing—the men would excavate a little portion ahead and then shove the spiling up, and excavate a little more and shove the spiling; that is known as advancing spiling; that is in ground fragile, easily broken, but not running, not particularly dangerous. Where the ground cannot be excavated at all until you have offered some support to it we have the same method of spiling. We drive it with rams into position and form a complete coverage to the men, often times both on the sides and the top, and then carefully remove that.

(Testimony of Lewis Michael Larson.)

Mr. Marrin: I would like to offer at this time in connection with this testimony for illustrative purposes this poster as Plaintiff's Exhibit 32. [575]

Mr. Tinning: As I understand the offer, so that the record will be clear, this is a demonstrative diagram which you propose to use for the purpose of explaining the witness' testimony with respect to spiling or other forms of timbering, and it is not intended to represent any particular timber or any particular section in the tunnel, but demonstrates the method which he said he was proposing to use when he was making these estimates.

Mr. Marrin: That is correct.

(The poster was marked "Plaintiff's Exhibit 32.")

Q. Referring to Plaintiff's Exhibit 28, is any spiling snown on that exhibit?

A. Yes, spiling is shown on the arch, here, and was used throughout without exception, as I recall it now without any exception on the arch; on the sides sometimes the ground would admit of lagging but sometimes it was necessary to have advanced spiling and sometimes it was necessary to drive spiling.

The Court: Q. What were the dimensions of that timber?

A. The dimensions of the timber was 12 by 12, that is, the posts and caps were 12 by 12, and the lagging in most instances was 2 by 10 or 2 by 12, and the spiling generally 3 by 6 or 3 by 8.

Mr. Tinning: Might I interrupt, to save time? Mr. Larson stated without exception spiling was

(Testimony of Lewis Michael Larson.)

used. Do you refer to the area shown in the first model as having the timbering in the tunnel?

A. No, I am merely referring to this model.

Q. Going underground? A. Yes.

Mr. Marrin: Q. For what distance was that?

A. That was planned for 40 feet; that was the plan on each of the two tunnels on the west end and each of the two tunnels on the east end, a distance of 20 feet. [576]

Q. Further referring to the spiling, and referring to Plaintiff's Exhibit 32, will you explain from that the driving of this spiling, taking the operations in sequence, starting with the drawing on there, No. 1? A. Yes. This illustrates——

The Court: Pointing to No. 1?

A. Pointing to No. 1, illustrates the breast boarding, as we were presumed to have a liquid or a moving mass of material that threatens to come into the drift in advance of the time that it is wanted to come in. Now, this illustrates the way it is being supported in advance of the last set. This, by the way, is a set, this shows the posts and the caps that form the set, and the spiling that forms the side, the spiling that forms the roof, and the breast-boarding that protects the material from coming into the drift. Now, the first stage in wanting to make further progress to reach the position shown here by the dotted line would be a condition where driving has to be done instead of, as we term it, advancing. Spiling has to be driven—have you

(Testimony of Lewis Michael Larson.)

anything to illustrate a ram, any picture—I suggest that would be clearer.

Q. What is the difference between driving and advancing spiling?

A. In driving spiling you have to drive it in by forcible means from the rear. In advancing it sometimes you can tap it in with a light hammer, as the excavation is advancing, that is, progressively tapping and progressively moving in with your spiling. That is known as the advance system. Where you cannot do that at all but where you have to drive in in advance, as I explained a little earlier, it is known as driving spiling.

Mr. Marrin: In order that this may be clear to the Court, I would like to offer at this time, simply for the purpose of illustrating the ram, and for no other purpose, a photograph, as Plaintiff's Exhibit 33.

(The photograph was marked "Plaintiff's Exhibit 33.") [577]

Q. Will you explain to the Court, Mr. Larson, from that, what that picture illustrates?

A. This illustrates the ram by which the spiling is driven. You will note that it is suspended on a rope, so the men would not have to carry it, and it will swing forward and back without any appreciable lowering or raising; by being protected in that manner against lowering or raising, it gives a man on the forward end an opportunity of directing the point of driving; that is, he can head the spiling in——

(Testimony of Lewis Michael Larson.)

Q. In order to do that do you have to excavate for it?

A. This is back in the drift. I will illustrate here. The men who are driving that, if they are going to drive this one, are standing back there.

Q. The witness is pointing to Fig. 3 on Exhibit 32.

A. The men are always standing in an excavated drift, and these men are standing in an excavated drift and driving spiling.

The Court: Q. What do they drive that with?

A. They are driving it with this ram. It is like a big hammer, only it is of considerable weight and when it is projected forward there is a force applied by the men on these handles, it is like a pile driver hammer, in a measure, only being driven in a horizontal position.

Mr. Marrin: Will you proceed with your explanation of Exhibit 32?

A. We will assume that we are going to make a further advance of any definite number of feet, let us say 4 feet. We will take a piece of spiling that is longer than that by two and a half to three feet.

The Court: For the purpose of the record you had better note that.

Mr. Marrin: The witness is referring to illustration No. 1 on Exhibit 32. [578]

A. A piece of spiling is entered underneath the cap of the set next back of the forward set that has

(Testimony of Lewis Michael Larson.)

been placed and over the cap of the forward set; the spiling is driven by the ram until it passes this cap, in advance of the cap of the set back of the forward set; in advance of the time the spiling passes the cap of the set next to the forward one a block is put in above that spiling illustrated by sketch 3 of Exhibit 32. That is known as the tailing block. That prevents the spiling from dropping at the forward end and gives a general direction to the spiling as it is being driven. This Sketch No. 2 of Exhibit 32 illustrates the spiling having been driven over the top of the drift. This illustrates only one spilling—there may be several of them; there would be enough over the top of the drift to form a roof of the section that is to be excavated; then what we term side spiling is being driven, and in a very similar manner. This sketch which is blank—No. 4 we will term it—illustrates a similar condition.

Q. I will mark that No. 4.

A. These blocks in here that I am pointing to that rest against the post of the forward set—I should say the set is comprised generally of two posts and a cap. These blocks are placed in there in the position shown——

Q. The witness is referring to No. 4 on Exhibit 32.

A. (Continuing) —to hold a block or a piece of wood away from the post of the forward set, and the spiling is driven from that position so that the next spiling can be entered between the post and the

(Testimony of Lewis Michael Larson.)

spiling that has already been driven. In each case the spiling is fanned to give a greater dimension to the drift than the neat lines of the drift; the purpose of that is always to permit of other spiling being driven in between the outer spiling and the posts; this new spiling, in turn, was driven in starting between the old spiling and the post, but fanned out as the previous spiling [579] was driven. That driving of spiling on the outside of the posts, on one or both sidess, is done when the ground is unstable and won't stand without a protecting shield being driven in in advance of removal of the earth.

Q. Would you use that spiling in self-supporting ground, Mr. Larson?

A. No, indeed not, it is not necessary.

Q. Referring to illustration No. 1 of Plaintiff's Exhibit 32, do I understand you that illustrates the first set in the advance of a drift which had to be driven by using spiling and breast boards?

A. That is correct.

Q. Referring to Illustration No. 2 of Plaintiff's Exhibit 32, does that illustrate the next step which is followed when a drift is driven in that manner?

A. Yes, that illustrates the top spiling having been driven and the side spiling having been begun and the breastboarding having been begun.

Q. This one, for the purpose of the record, does that indicate the commencement of the breastboarding for the advance drift? A. It does.

(Testimony of Lewis Michael Larson.)

Q. With that complete these breastboards will extend down to the bottom of the drift?

A. That is correct; this being added as this earth is excavated below the other breastboard of the muck that is left in the drift; when that is excavated far enough down to permit another breastboard being placed below the one above then another breastboard is added and that is continued until you reach the point at the bottom of the drift, or as far down as the condition of the material that you are in will demand; sometimes it is not so liquid as it is at other times, and sometimes you can stop your breastboarding in half the distance.

Q. The purpose of placing that breastboarding in there is to prevent the unstable material from coming into the drift from the [580] cut before you are ready to take it out?

A. That is true; if it is permited to run and a cavity forms above, then the open area may come down and break the spiling already driven and catch men that may be working underneath it.

Q. These breastboards, as they are placed, are supported by a stull?

A. Yes, supported in position by a stull carried from the breastboard back to the cap or the posts of the set, against the face, or sometimes carried to the set back from the forward set.

Q. That term "stull" is a new term. A stull, as you use it in tunnel parlance or language means a brace, does it not?

(Testimony of Lewis Michael Larson.)

A. That is what it means, exactly.

Q. Then as you proceed to advance your spiling on the side and place the breastboards in this position—I am now referring to Illustration No. 2, you brace your timber to this post or cap and then remove the lower breastboard and take out a certain amount of material: is that correct?

A. That is correct, take this breastboard out and use it for the next breastboard in advance.

Q. Referring to Illustration No. 3 on Plaintiff's Exhibit 32, does that illustrate the completion of this operation which is commenced in No. 1 and No. 2?

A. It does. It shows the completion of the spiling that has been driven over the top, the spiling that has been driven over the back or the sides, and the breastboarding in position. The next step is the facing of the side, itself, which is illustrated here by the dotted lines. This dotted line below on No. 3 sketch that I am referring to indicates what we term the foot block, any block that is placed underneath the post to keep the weight of the material from driving itself down into the ground below.

Q. This dotted line on No. 3 is the commencement, is it not, of the post which is shown here on Plaintiff's Exhibit No. 28, to [581] which I am pointing, the dotted line, here?

A. Yes, that shows that post of the set or that may be any post.

(Testimony of Lewis Michael Larson.)

Q. That is correct, but it shows the commencement of that bracing operation? A. Yes.

Q. Referring to No. 4 on Plaintiff's Exhibit 32, does that illustrate an end view?

A. An end view of the boxed drift showing the spiling having been driven on each side, the spiling above having been driven, and the breast-boarding in, with a stull supporting the previous work, and new spiling having been started for the next advance, and other spiling that has been entered that has not yet been driven. Now, we have what is called fan spiling as against horizontal; in order to reach the corners or the greatest extent in width that is necessary in the driving of spiling, being confined in width at the backward side or the backward end of the spiling, it is necessary that some of the spiling that is being driven should be chamfered to a wedge shape, so that the forward end will fill that space that otherwise would be left open if you were to drive spiling in a fanned position, and that allows then and accomplishes the purpose of closing in the forward extension of the spiling, as well as in the backward end of the spiling, the complete excavated area, or the area to be excavated will have no opportunity for fluid material to come in.

Q. Mr. Larson, referring to Plaintiff's Exhibit No. 28, as I understand your testimony it is the circumferential drift system. Does that illustrate the method that you planned, or the method that was actually used?

(Testimony of Lewis Michael Larson.)

A. This illustrates the method that was actually used. The plan had to be departed from on account of——

Q. (Interrupting) Do not give the reasons right now, but just point out the difference between that and the method that you planned? [582]

Mr. Tinning: Q. You have an exhibit showing the plan he proposed, Mr. Marrin?

Mr. Marrin: Yes.

Mr. Tinning: Could we use that in this testimony?

Mr. Marrin: I believe we could; also point out there were more drifts actually used than planned, so this exhibit will not be confused with his planned method.

Mr. Wittschen: That was his planned method, was it not?

Mr. Marrin: Yes.

Mr. Tinning: That is Exhibit No. 27,—the one showing 11 perimeter drifts, starting at the bottom and running to the crown drift at the top—what he planned to use.

The Witness: Well, the difference being here, in the addition of 2 more drifts; instead of carrying 11 drifts, it was necessary to carry 13. The reason for that—do you wish that now?

Mr. Marrin: Q. You don't need to go into the reason now. This model does not show this separate timbering on top, separate drifts?

A. No. This model, to be complete, should show posts at the meeting point of the segments carried

(Testimony of Lewis Michael Larson.)

around, carried down to this central portion which is known as the core.

Q. Now, Mr. Larson, referring to Plaintiff's Exhibit 27, to Section "B," also referring to Plaintiff's Exhibit 30,—which is one of the wooden models,—will you explain to the Court, by reference to this model, the method of excavation which you contemplated using and which is known as the "wall plate method"'—you might just proceed to explain as it is illustrated on Exhibit 30?

A. Model 30, your Honor, illustrates the position of the wall plates, with respect to the subgrade. The subgrade is the bottom of the excavation that is to be made. The wall plate is placed in an elevated position, as shown on Exhibit 27, Section "BB."

[583]

Q. About what is the elevation of that, in this tunnel?

A. In this tunnel, it varies from around 15 feet to 17 feet 6, from the subgrade. The plan contemplated going in with the drift adjacent to the wall plate. After the drift had been advanced a certain distance, the wall plate would be entered to an exact elevation and to an exact alignment. On that wall plate, it was planned to erect permanent segments,—which is illustrated on No. 30,—showing a completed ring. That, however, was a progressive step. First of all, the wall plate would be entered——

The Court: Q. For the purpose of the record, the—define a "wall plate."

(Testimony of Lewis Michael Larson.)

A. A wall plate is a heavy piece of timber, depending in size and weight upon the material that is to be carried—generally, 12 by 12 or 14 by 14. I am speaking of inches, now, in the dimensional timber. It has a length varied for the ability to make an excavation of a certain length. Before entering that wall plate in its position, sometimes the ground is in such condition that you do well if you can get in 20 feet of wall plate; other times, you can get in 40 or more; that is a matter of ground condition. When the ground has been excavated and the segments—these are known as "segments" that form the arch—the timbers that form the arch, to raise the wall plate, are known as "segments."

Mr. Marrin: Q. For the purpose of the record, Mr. Larson, in explaining the wall plate described on Exhibit 30, you have been pointing to a horizontal piece of timber which is lying in the first drift, on the model; and, when you are referring to "segments," you are referring to a more or less vertical piece of timber—or timbers, which are resting on the wall plate? You may proceed.

A. When the segments are placed in position, a collar brace is placed between the new segment that has been put in and the segment in the set next adjacent to it; and the purpose of a collar brace is to [584] hold the proper alignment, forward and aft of the segment that is being placed to complete the next ring.

Mr. Wittschen: Q. Will you point to the collar brace? A. This is it.

(Testimony of Lewis Michael Larson.)

Mr. Marrin: Maybe I can explain that. In referring to a "collar brace," the witness is referring to a horizontal piece of timber between the segments; and, on this model, appearing above the wall plate.

The Witness: We will assume, now, the wall plate has been completed, and the segments placed on the wall plate. Those segments we have indicated in our sketch as "Segment A"; and a crew then begins the drift immediately above, which is excavated when the lower or the wall plate drift is advanced far enough to make it safe for workmen. That excavation is carried on, and, as the excavation proceeds, segments are placed on top of the segment that rests on the wall plate. That segment is generally indicated, in our sketch, as "Segment B."

I may state that, while the excavation is going on, on the left-hand side of the tunnel, a similar excavation is going on, on the right-hand side. I am describing only one operation; but each side of the tunnel is duplicated in that operation.

As the segments are placed and the excavation is completed and segments placed in the drift above, the wall plate drift collar braced, the collar braces are placed in that, and such lagging or spiling as might be necessary to prevent the material,—that is, the rock, from above,—falling into the drift. Sometimes it is necessary to drift and spile. Sometimes you can make the excavation without any lagging.

[585]

(Testimony of Lewis Michael Larson.)

Then you proceed with crews in the drift that is above this completed drift; that would be the third drift; and the following drift completed; in each case, the material in the drift above is dropped down and left in the drift, or used in the wall plate drift itself; sometimes it is wheeled out, by some means,—either a powered equipment or by hand equipment—and dumped into the main portion of the tunnel, at the face of the core, to be removed later on with powered equipment.

As the drift next to the top is completed and the timbers put on in the same manner,—a collar brace and lagging or spiling, as the case may be—in the manner as described below, on the top wall, is started.

The Court: Q. So I may follow: The core is still in there?

A. The core is always left in until the arch timbers are completed; so, if necessary, you can get support from the core to hold the timbers. Sometimes the order has been changed, and you may have to run your top drift in at the same time that you run your side drift, in order to hold a condition of the ground that is less favorable than the kind of ground which has been timbered by the method that you pursued; in which event, you give more support to the material from the top. That support is carried down onto the core, which is already in at this stage of the game. Then the timbers are placed in there. That is what is known as

(Testimony of Lewis Michael Larson.)

the "cap,"—that is, the top segment. It helps, of course, to form, in most cases, the key piece of timber. That now completes the arch, where it still is a key timber, even when you have to drive the drift first; but it sometimes is not the last piece of timber placed. Sometimes it is one of the first pieces of timber placed; in which event, the drift adjacent to the top drift is generally the drift as last completed, when you have the ground conditions that are unfavorable and you [586] have to drive your top drift first, and then you have to drive that muck out, or remove it by some powered equipment, from the drift, and remove it over the toe of the core, and get your support for the drift, and then crews are placed, to follow up; generally, one crew above the wall plate drift first, followed by another crew in the closing drift, which is adjacent to the top drift and which is spaced sufficiently far apart as to be no danger to the men working below.

Q. I am pointing to this drift which runs along parallel to the wall plate—that is what you refer to as the wall plate drift? A. Yes.

Q. And, ordinarily, that is excavated first, and then your second drift follows along behind, and then the third and fourth and so on?

A. That is correct,—generally carrying an average of 20 to 30 feet in advance of the next.

Q. Before any attempt is made to remove anything, when that system is followed, I believe you

(Testimony of Lewis Michael Larson.)

stated the timbering is completed over in the other wall plate,—a similar wall plate on the other side?

A. Yes.

Q. So that there is a complete arch over the core, supported by the two wall plates, before the core is removed? A. That is correct.

Q. To go to the next step in the operation: After the arch is completely timbered for the core, over the core, then what do you do; do you remove part of the core?

A. Yes. We remove part of the core; and that is conditioned, again, on the kind of ground we have. If the ground is favorable, it means that there is not much weight on the arch timbers. If there is not much weight on the arch timbers, you can shoot out and remove more of the core than you can if you have excessive weight above, for this reason: that the wall plate will suspend a certain distance, and a certain weight, dependent on the strength of those timbers, and the size of your wall plate. [587]

Q. You mean the unsupported wall plate?

A. The unsupported wall plate,—the overhang; the unexcavated portion; it supports the unexcavated portion, which will overhang the excavated portion a certain distance.

Q. In order to make it perfectly clear to the Court, Mr. Larson: if I am correct, this model shows a wall plate extending in that far; it is supported, on the end toward the portal, with these timbers which are called "posts"? A. Yes.

(Testimony of Lewis Michael Larson.)

Q. It is supported on the other end by resting on the ground in the wall plate drift?

A. Generally on blocks and in a definite elevation to the wall plate.

Q. But the blocks are on the ground?

A. Yes.

Q. When you speak of the "unsupported part of the wall plate," you mean, as you excavate the core here, before you can get the additional posts in, there will be a certain ection of wall plate between the last post and the place where it is supported by a block in the drift, which will have no support under it?

A. There would be no support, and we have, ordinarily, neither the span—sufficient span or strength or weight above. When the ground is hard above, the weight is minor. When the ground is wet above, the weight makes it very heavy to excavate, and we may have to put another post in. As the core is excavated out, the post is advanced up to the excavated portion, to give support there to the wall plate, and the earth removed. That step is carried on progressively; as the core is removed, new wall plate is entered, new posts put in, and so on,—always, the drift being carried on in advance; the core being the last earth to be removed.

Q. That illustrates the wall plate method?

A. Yes.

Q. The method you intended to use, in the 700 feet—— A. 720 feet.

(Testimony of Lewis Michael Larson.)

Mr. Wittschen: Were you going to show it as it was used? [588]

Mr. Marrin: Yes, Mr. Wittschen. We will show what was actually used, in the following testimony.

The Court: Q. Are you prepared to prove, now, how much of this method was used,—for what distance, if you know?

A. I would have to refer to the records.

The Court: Have you any thought?

Mr. Marrin: I might explain this, your Honor: It was our thought—this does not necessarily have to go in the record—but he was with the company until April 30, 1935, and thereafter did not have charge of any of the driving which went on for a year or so after he left. We may have the accurate information in our records. May we have the full face method explained now?

The Court: Q. What method did you call this?

A. This is the wall plate method.

Mr. Marrin: Q. Mr. Larson, you stated that the other method that you proposed to use was the so-called "full face method,"—which is illustrated by Section "CC" of Plaintiff's Exhibit 27. I would now like to refer you to Plaintiff's Exhibit 29, and ask you to explain the excavation, by the full face method, from that exhibit; and, in connection with that, we have another illustrated drawing, which is merely illustrative of the method, and which I would like to introduce at this point as Plaintiff's Exhibit 34.

(Testimony of Lewis Michael Larson.)

(The drawing was marked "Plaintiff's Exhibit No. 34.")

[Set forth in the Book of Exhibits at page 262.]

Mr. Marrin: For illustrative purposes, I would like to offer in evidence the poster, as Plaintiff's Exhibit 35.

Mr. Tinning: What do you call Exhibit No. 34?

Mr. Marrin: 34 is a sketch illustrating the self-propelled drilling and timbering Jumbo. No. 35 is a poster which illustrates the method of placing concrete and the Jumbo in operation in the tunnel under the full face method. It has no legend on it.

Mr. Tinning: Simply illustrative?

Mr. Marrin: Simply illustrative of that method.

[589]

Mr. Tinning: It is a method Mr. Larson says he was going to use after his 720 feet of wall plate drift was completed?

Mr. Marrin: That is correct.

The Court: Q. Which method, I take it, is the economical method. A. That is correct.

Mr. Marrin: Q. Will you proceed to explain the method which you proposed to use in construction, by the full face method, Mr. Larson? You may refer to any of these exhibits. In referring to them, will you please refer to the number?

A. This first one illustrates, your Honor, the drill carriage.

Mr. Marrin: The witness points to No. 34.

The Witness: A. The drill carriage, in position, showing the drifter on the bar, with relative

(Testimony of Lewis Michael Larson.)

positions of the drill carriage. I will describe the operation of the drill carriage, so as to make it clear, in the later conversation, what is intended.

This drill carriage was planned to have mounted on itself a self-propelling unit.

The Court: Q. Pardon me. That was to be the method used in the tunnel,—the rock tunnel?

A. No; that was used in the section—the one described,—what is known as the "full face method."

Q. I had particularly in mind the Hetch-Hetchy Bore,—that rock tunnel. Are you familiar with that?

A. I am not familiar with the upper portion of the Hetch-Hetchy; no.

Q. What I had in mind—I was up there at one time, going through there, and they were drilling through that rock; and I saw a sort of carriage. Would you call that a "carriage"?

A. Yes, a drill carriage.

Mr. Marrin: Q. Mr. Larson, you might explain that, by reference to this Plaintiff's Exhibit No. 29,—which is a model of the carriage—just how that operates.

A. It operates on a track, your Honor, and runs into the face, and also runs out. It would [590] have mounted on itself an air unit whereby it can be operated forward and backward, from air supplied from the outside. It would have another unit mounted on itself, which would be raised and low-

(Testimony of Lewis Michael Larson.)

ered. It has a platform on the drill carriage; and, in the position that would be necessary in drilling the next hole, this platform would be in, as illustrated, back in the back; but the method here would be for a reserve supply of storage when the driving is done for the timbers that would be used for putting up the next advance set; and when that would be completed, it would be used for the dynamite for loading the holes. The drill carriage was so designed or planned, and partly completed, on the job; and, when it was in those positions, it could be locked into position. The reason for that: it had to have a width sufficient so, when it was taken up from the face of the tunnel, that it would pass over a shovel,—air, steam or whatever you might wish to term it—a powered unit—so it would be free to slide over, or the shovel would be free to slide under. On this bar, illustrated here, is a circular extension of the drill bar for the purpose of permitting the arch—there is a section from here, up,—from the bottom of the top floor of the drill carriage, where the drifter could be advanced no further because of obstructions. To overcome these obstructions, a circular drill bar was placed, to carry the drifter for drilling the arched section of the face. While I have this chart, I think I should illustrate to his Honor the platform on top.

The platform on top was intended for crews to stand on, in placing the timbers, and for plugging. We speak of "plugging" where rocks that are not

(Testimony of Lewis Michael Larson.)

shot into the clear,—that is, not removed in clearance of the concrete line. It is sometimes necessary to drill holes in the rock,—which we term "plugging"; and put in a small amount of explosive there, and break that off. The purpose [591] of this platform was to make it as reachable as possible to all parts of the tunnel. That, as I explained a little while ago, also was erected on the drifter as well as on the drill carriage.

Q. Will you explain the operation of excavation by this method?

A. This sketch No. 35 illustrates the power shovel in the process of excavating the material that has been shot down in advance of the set adjacent to the face. It illustrates a swinging platform that was intended, after the shot was off—that men, by means of wire rope ladders, would mount this swinging scaffolding on which spiling had been previously placed. After the shot is off, they would mount onto this swinging scaffolding, and comb—what we call "combing the face"—taking the loose rock off; they would comb as much of the face as they could reach, and comb the arch, and they would advance that spiling, as illustrated in the previous sketch. It would be in a sort of cantilever position, supported by the spiling back of it. That would be a protection to the men who were working below; they would spile the arch section,—not close, but sufficient to protect any block of material that might—small blocks, that might fall off, from getting loose. As illustrated here, this spiling is in position.

(Testimony of Lewis Michael Larson.)

Mr. Marrin: The witness is referring to Exhibit 29.

The Witness: A. This illustrates the face to be shot out next—the thought being, in this case, to place all of this timber inside of the concrete lining. These hatched portions indicate the ground, and the timbering is in, and what we term the "outside pay line of concrete," with a reasonable allowance for what we term "overbreak,"—which is outside and permits room for the spiling that has been placed, the thought being, as the concrete came along, to take out the timber set and leave the spiling in, if it were [592] permissible to leave the spiling in; if not, we could take it out. That would be conditioned on ground condition, again.

Q. And conditioned on the ground being self-supporting? A. Yes, that is the point exactly.

Q. Mr. Larson, after combing the face, what is the next operation?

A. While the face is being combed and the spiling is being placed, this shovel is loading the muck into whatever it happens to be. When the muck has been all removed, then the shovel will back out to a position—a position which is a safe distance, and the drill carriage will propel itself up to the forward position. While the muck is being removed, the drill carriage has been loaded with timber for the next advance set. When the shovel moves back, the drill carriage moves forward. In the advanced position of the drill carriage, illustrated here, the drifter is mounted on the bar.

(Testimony of Lewis Michael Larson.)

Q. A drifter is a drill, is it not?

A. A drifter is a heavy drill. The drill platform lowers to the position illustrated here,—Plaintiff's Exhibit 34. In Exhibit 34, the drilling operation is being done. It will be noted on that Exhibit No. 34 that there is a swinging platform on which the men will stand. The purpose of that swinging platform is that the men can drill to the best advantage, at a certain elevation; if they stand with a drifter at about their waistline, they can operate to better advantage than any other position. As they are driving, the platform with the men with the drill steel, and with the drifter, will be raised to the next point of attack where the holes are next to be drilled, and so on until all the holes have been drilled. When they have been all drilled, the next process will be to blow out the hole. When you drive a hole in a rock, there is always a lot of fine rock that has to be blown out. They will blow that, as the platform is being [593] lowered. When the platform is at the bottom, the powder that has been brought in,—the dynamite and exploder will be mounted on the platform, and the loading process will go on, as the elevation of the platform progresses. When the holes at the top have all been loaded to shoot the face,—there is only one way, and that is to put in each hole that has been drilled a stick of dynamite, put into what they term the bottom of the hole, and ram it into position with a wooden bar; then put in what they term the primer; and the primer is another stick of dynamite that

(Testimony of Lewis Michael Larson.)

has an explosive cap in it; these exploders are numbered from No. "0" up to whatever number might be required; sometimes it is "12"; sometimes as high as "15"; the reason for numbering is: we term them the "no delay,"—those are marked No. "O"; just the instant the power,—the electricity,—is turned on, they explode, and they follow —every one follows at a short interval.

The Court: Q. Does one depend on the other?

A. No; they all depend entirely on the live line that is carried through. The construction of the cap, now, generally,—the fulminator in it,—delays the inception, so it can be absolutely controlled. On No. "0", no delay, the instant electric current hits it, it explodes. The fulminator controls the subsequent rate of those which we term the No. 1 and No. 2 and No. 3, and so on, until your last one has been shot. The purpose of that is to control the break of your ground.

Q. What is the purpose of controlling the break of your ground?

A. The way you want it to break,—whether from the top, the center, or otherwise.

The Court: I see. [594]

It was planned in this instance to break at a point about 3 feet above sub-grade, with three sets of what we term "no delay," loaded with "no delay" fulminators; they would break the ground; then there were other holes adjacent to that, and that would enlarge the hole into a sort of inverted wedge shape and thus prevent the scattering of the muck—the

(Testimony of Lewis Michael Larson.)

first holes, the breaker holes, will oftentimes throw the material quite a ways back. That is for the reason that it costs a good deal, both in delay and in money, to clean up the track and open the face; that is a period of delay that we try to avoid as much as possible by confining the muck that is broken as near to the face as possible. To accomplish that, however, after these breaker holes have been shot and the enlargement process goes on, after the first shot next is a breaking into the hole that has already been made; very little scattering of muck occurs.

The Court: It is to control the muck?

A. Yes. Then we began what we term caver shots, that is, a shot that will bring down the lower or back end of the hole, and when it is shot it drops straight down instead of shooting out into the tunnel, and after a certain weight gets onto the lower holes they are known as lifters; they generally lie in a position that would have a tendency to throw the muck out in the tunnel if the load from the shot above were not on it; this is prevented by the muck from the breaker shots putting a heavy enough load onto the lifters when they are shot that they will only raise a disturbance, that is, break the muck and not throw it out into the tunnel. The last shots that are shot are the upper ones, and known as the ring shots, that help form the arch.

Mr. Marrin: In order that the record may be clear, Mr. Larson, you mean by the delay, do you not, only this, all of the shots are [595] discharged with one throw of the switch?

(Testimony of Lewis Michael Larson.)

A. That is correct.

Q. The entire delay is due to the difference in the cap, of the fulminating caps on each of the holes?

A. Yes.

Q. And the delay between one set of holes exploding and the next set of holes is only a second or so?

A. That is correct. The holes are shot and the whole breaking situation is generally accomplished inside of a couple of minutes.

The Court: What you mean by delay there is the whole purpose being to control the material, itself, to get the best possible results from your explosive? A. Correct.

Mr. Marrin: Q. If I may ask you another question, the best results in placing and also the best results in order to break the rock, is it not?

A. Breaking of the rock that can be removed, not an over-break; that is an important matter.

Q. I think, as you explained it, after the holes are placed along the bench above the bottom at the grade of the tunnel—the central portion of the face is blasted first?

A. Yes, first of all the enlargement is made from the V-shaped holes that are first formed.

Q. That is the central portion? A. Yes.

Q. Then that would take out these V-shaped portions in the central part of the face of the tunnel?

A. Yes.

Q. And then following that the next holes are exploded and there being no resistance there because

(Testimony of Lewis Michael Larson.)

the central part has been removed, would tend to throw the rock into that space?

A. Into the space that was accomplished by the first shooting.

Q. Mr. Larson, referring to Plaintiff's Exhibit 34, the entire face would be, the entire diameter of the tunnel would be drilled at that time, would it not? A. That is correct.

Q. And this dotted line section here which is ahead of the drilling [596] Jumbo would show approximately the amount of rock that would be broken down into the bottom of the tunnel?

A. That is a typical display to indicate it.

Q. Then the next step would be, if I understood you, to run the drilling Jumbo back into the tunnel shown on Plaintiff's Exhibit 35?

A. Might I be permitted to clarify that, I used the term "Drill carriage"—drill carriage and drill Jumbo are synonymous.

Q. And then run the cars up to the face, load it up onto the cars, that which has broken loose at the time of the blast? A. That is correct.

Q. Then after that is completed run the drill carriage up to the face and repeat the operation?

A. Yes, repeat the operation, as illustrated in this case.

Q. In that system there are no drifts, are there?

A. There are no drifts in that system, not as predicted, the ground being self-supporting.

Q. Now, referring to Plaintiff's Exhibit 29 again,

(Testimony of Lewis Michael Larson.)

is that a typical illustration of the timbering which you intended to use in the full faced method?

A. It is.

Q. There is no lagging contemplated on the side posts, is that correct?

A. There was none contemplated.

Q. A certain amount of spiling or lagging was contemplated over the arch? A. Correct.

Q. What was the purpose of that amount of timbering?

A. That was not a definite amount; it was definite only for the purpose of estimating, but it was a certain spacing which was assumed in order to get the quantity of timber that was necessary, and its purpose in being placed there was to protect the men below from the dropping of large blocks of rock; they would have combed or trimmed off the loose material, but this is not always possible [597] to accomplish; sometimes there are mishaps. These timbers were put in to prevent these mishaps.

Q. This timber which I am pointing to and this post and these segments going from one set over to the other is ordinarily referred to as a set, is it not? A. That is an independent set.

Q. If I understood you correctly it was contemplated that these sets would be removed before the concrete operation?

A. That was the plan.

Q. Now, Mr. Larson, what plan did you contemplate in placing the concrete lining in the tunnels at the time you made your estimates?

(Testimony of Lewis Michael Larson.)

A. I had planned on placing the concrete by the pneumatic system, using a movable steel form mounted on a form carrier as illustrated on this Exhibit 35. This is illustrated by this sketch. This portion, your Honor, shows a completed concrete section.

Q. May it be shown for the purpose of the record that the witness is pointing to the illustration at the lower left-hand corner of Plaintiff's Exhibit 35.

A. The next portion that would be presumed to be of concrete is illustrated by the position of the forms. These are steel forms mounted on a carrier, with jacks in position to raise or lower or space the forms out or in. The position here shown is a car of concrete, assuming the position of a car of concrete to be pulled up over a pneumatic gun; the pneumatic gun is shown below this ramp, that pipe leading out from it along the form carrier support; another pipe illustrated as going up over the top, the plan being to have laterals leading out from these pipes that are shown at an approximately half-elevated position, if the concrete is to be conveyed from there to the side wall, where it would be discharged into what we term elephant trunks—an elephant trunk is a column projecting down from a receptacle through which concrete is [598] dumped from a higher elevation to a lower position. When the side walls have been brought up--I should have stated that this car would be conveyed to its position over the pneumatic gun by a hoist mounted on the

(Testimony of Lewis Michael Larson.)

frame of the form carrier; it would be dumped into the gun, and dropped down and another one brought up, and the process repeated. As the gun was loaded the air under pressure from the outside would be placed into the gun, which would convey the concrete over to the side walls or up over the arch. Assuming the side walls have been completed, to complete the pouring of the arch it was planned to cut the pipe into shorter sections of about 5 feet and when the forward end of the concrete was completed to take off one section after another, as the concrete filled that form, until finally closing up the bulkhead. That pouring then would have been completed. This pipe, then, that formed the top would have been removed entirely off the form. After the concrete had the required period of set the jacks would be released and the forms would be brought down from the concrete and moved into a new position, and the operation would be repeated. That was the plan that was contemplated, but it was all predicated on one thing, that we could remove the core in advance of concreting.

Mr. Marrin: I would like to interrupt and ask you this question. On this illustration on this poster they show the tunnel, do they not, as if you were looking at the side cut in two?

A. Correct, at the center line.

The Court: We will be in recess until two o'clock.

(A recess was here taken until two o'clock p. m.) [599]

Afternoon Session
2:00 O'Clock P. M.

LEWIS MICHAEL LARSON,

Direct Examination (Resumed).

Mr. Marrin: Just before the noon recess your Honor asked Mr. Larson if he could state the number of feet of the wall plate method which had been installed. Have you checked the records on that, Mr. Larson. A. I have.

Q. Can you tell the Court how many feet were actually installed in that tunnel?

Mr. Wittschen: Is this only the part of the tunnel built under his direction, or the whole tunnel?

The Court: I was just asking casually.

Mr. Wittschen: I am not sure.

Mr. Marrin: He is testifying to the whole tunnel.

Mr. Tinning: That is, the whole tunnel that was constructed by the Six Companies?

Mr. Marrin: By the Six Companies.

A. There is a total lineal feet of tunnel of 3065.

The Court: In length?

A. That takes in the two tunnels.

Q. Both sides.

A. A total of 3065 lineal feet.

Q. Of the wall plating method? A. Yes.

Mr. Marrin: Q. How many feet of the drift method. A. 172.

Q. And of the full face method? A. None

Q. I did not ask you the size of these tunnels, Mr. Larson. Could you tell us the size of the tunnels?

(Testimony of Lewis Michael Larson.)

A. The excavation size, the size that it was necessary to excavate in order to get the timbers in to the right distance to admit of the concrete lining where the timbers were left in approximated about 39 to 40 feet in width, and the height at centers above sub-grade was approximately [600] 36 feet.

Q. Does the size of the tunnel have anything to do with the difficulty of holding the ground?

A. It is very material in adding to the difficulties if the ground is not self-sustaining.

Q. Is the larger tunnel more difficult to hold?

A. Very much more. It increases the difficulties as the size increases.

Q. How far apart did you plan to space the timbers under the various methods that you described this morning? A. 5 feet in all instances.

Q. Five feet?

A. 5 feet centers between sets, between individual members of the sets, that is, I mean the complete set, 5 feet to the center of the next set.

Q. Referring to Plaintiff's Exhibit No. 29, by that you mean it would be 5 feet between the center of the first segment and the center of the next segment?

A. Yes, and that if carried to completion it would mean 5 feet between every member of the set.

Q. What was the size of the timbers that you planned to use in that set?

A. It was contemplated 12 by 12.

(Testimony of Lewis Michael Larson.)

Q. That would mean the space between timber sets would be 4 feet?

A. Correct, that would be the length of the collar brace.

Q. You started to describe the concrete practice, and I am not sure just exactly where you had gotten, but in connection with that I would like to offer in evidence as Plaintiff's Exhibit 36 this poster which is illustrative of a pneumatic gun for placing concrete in tunnels or other structures.

(The poster was marked "Plaintiff's Exhibit 36.")

And I would like to also offer at this time two photographs, the first of which states that it is a 28-foot section of steel tunnel form of carrier erected at the Berkeley Construction Company prior to delivery to tunnel June 19, 1935, for the purpose [601] at this time of illustrating the testimony of the witness as to what a steel form is.

(The photograph was marked "Plaintiff's Exhibit 37.")

[Set forth in the Book of Exhibits at page 263.]

Mr. Tinning: What number is that, 129?

Mr. Marrin: 129. And photograph No. 130, another view of steel form of carrier, June 19, 1935, for the same purpose.

(The photograph was marked "Plaintiff's Exhibit 38.")

Q. Mr. Larson, will you proceed to describe the method which you planned to use in placing this concrete in the tunnel?

(Testimony of Lewis Michael Larson.)

A. I proposed to use what is known as the Hackley gun, a gun with which I was familiar and had used in the placing of many yards of concrete. It is illustrated by Plaintiff's Exhibit No. 36. This end of the gun, the backward end of the gun, shows a connection between the compressed air from the outside of the tunnel—referring in this particular instance to two tunnels—the hose that connects the air line to the intake or manifold of the gun. The gun is first loaded up, having concrete dropped in as its cover has been tipped back; it then fills a good portion of the body of the gun, the lid is returned to its closed position, and tightened down by this wheel and screw—that operates to tighten it; when it is secured the operator begins to make delivery of air to the intake of the air from the hose on the line on the outside and comes into this manifold; the first valve which is opened is the valve that connects with the long pipe. You will note on this sketch that there is a pipe that enters the longest pipe, there is the pipe that goes to almost the length of the inside of the gun; the purpose of making that delivery is to start moving the concrete in its free end and prevent it banking and plugging. When that concrete is started in this longest pipe and gets in motion through the pipe then the valve that controls the next longest length of [602] pipe is opened and it is carried in that open position, the longest one continuing to flow all the time and as the concrete is pressed forward the

(Testimony of Lewis Michael Larson.)

emptying of the forward end of the gun takes place; the next valve that controls next the longest length of pipe is opened and it carries more of the concrete in front of the longest or main delivery pipe, and when the concrete has gone pretty well out of the gun the fourth and last valve is opened. The pipe in this instance, just going inside of the shell at the bottom of the gun, has a tendency to throw less of the concrete upward. Each one of these valves is worked alternately so as to carry that concrete progressively to the delivery pipe, the longest pipe. When all of the concrete is moved out of that gun the operation is repeated again in the same manner.

Q. The illustration on the left-hand side of Exhibit 36 is simply an end view of the gun?

A. Yes.

Q. Is the concrete expelled from the gun with considerable force?

A. We aim to carry 100 pounds of air to unload the gun and it is a matter of very considerable force; it would be a dangerous force to stand in front of, if you were within a reasonable distance, say 50 or 60 feet or even 100 feet of the gun.

Q. Referring to the illustration on the right-hand side of Plaintiff's Exhibit 36, is this a portion of the pipe leading to the forms?

A. This is the end of the gun proper, and from here on this pipe, and that pipe is generally bent in a sort of "S" position. However, it does not

(Testimony of Lewis Michael Larson.)

mean, necessarily, that it has that particular bend. Sometimes the position of the gun means another additional piece of pipe before the sweep, as we term it, is put on; that is a long curved piece of pipe.

Q. Did you contemplate using that gun in placing the concrete here?

A. The estimate was set up on the use of that gun. [603]

Q. Did you explain the placing of the concrete as shown on Exhibit 35?

A. I was short in one explanation. It can be seen up there—this is on 35—there are some stulls that are indicated in this sketch that go on to the spiling and hold the spiling in position by the weight being transmitted to the forms. The purpose of that is to prevent any loose fragments that may possibly drop into the concrete where there may be an objection to its falling into the concrete, the thought being to keep that spiling in that position during the placing of the concrete, and if it should be opposed it could be removed. I think I have explained the rest of it, the delivery through the pipe to the side walls and over the arch, and the moving forward.

Q. About how far back normally from the face of the excavation would that concrete operation be carried on?

A. I had planned a distance all the way from 300 to 350 feet, so as to allow sufficient room be-

(Testimony of Lewis Michael Larson.)

tween the concrete unit and the excavation unit. There are trains working in here, switching cars, that have to be delivered to and taken away from the shovel. There has to be a location whereby the form carrier can be taken back, and when the concrete operation is going on there has to be a little distance in advance of the concrete form to allow the concrete car to be brought up where it can be taken by the hoist rope and carried up to its position. In order to allow sufficient latitude and work room I had planned a place between 300 and 350 feet as the proper distance.

Q. You planned to keep your concrete then 300 or 350 feet behind the excavation?

A. That was the thought.

Q. You spoke about using steel forms, Mr. Larson. Referring to Plaintiff's Exhibits 37 and 38, are those typical of the steel forms that you planned to use? A. They are typical.

Q. This portion going around here is a steel form—I am pointing to the circumferential part of the picture. A. Yes. [604]

Q. What is this within the steel form?

A. That is the form carrier that supports the form and these jacks that are illustrated as coming at different angles from the form carrier are the jacks that are used in spreading the form out to the necessary width, elevating the form to the necessary height. The dark interior is a row of track in such forms in order to carry the form forward; it would

(Testimony of Lewis Michael Larson.)

take very little adjustment, but the adjustment can be made, a form can be shoved over by driving studs against the form or by various methods.

Q. Have you explained how that operates? If you have not, will you do so?

The Court: What do you mean?

Mr. Marrin: I want to bring out the fact that this form is used and that it is jacked up, and then after the concrete sets the jacks are released and it is moved forward and re-set.

A. I brought that out this morning.

Q. What did you do with your estimates after you made them?

A. I made them up on individual sheets and as each sheet was completed I passed it to Orselli.

Q. Who was Mr. Orselli?

A. He was an estimating engineer in the employ of W. A. Bechtel Company, and he was assigned to assist me in making extensions and totaling up my figures to see that they were correct, and in getting the information on material prices that went into the construction, either temporarily or permanently.

Q. After the contract was awarded to the Six Companies of California did you enter its employ?

A. Yes, I did.

Q. What was your position?

A. Superintendent of tunnel work.

Q. What did you do thereafter in commencing the construction work under this contract?

(Testimony of Lewis Michael Larson.)

A. Immediately following the letting of the contract I assembled the necessary equipment and began its [605] installation for the progress of the excavation of the tunnel, and meanwhile collaborated with Mr. Fontaine in the excavation of the approach cut on the west end.

Q. Were any difficulties encountered in excavating that approach cut?

A. We run into unexpected difficulties; we run into one very soft place that apparently had been used at some previous time as the location of a water tank. We found evidence of it in timber that we removed. That made it difficult to find any way of supporting the tunnel and much of that material had to be shoved off by "cats", because the shovel could not get into it.

Q. What do you mean by "cats"?

A. Caterpillar tractors and bulldozers, that is a form of equipment; and in many instances we found that the material had a tendency to run outside of the right of way, the slope being steeper than the material would permit by carrying the open cut through the location of the portal; we had expected, of course, to find a considerable resistance there, because we were removing this drift to which I had referred, and it developed that there was very little of that material outside of the actual location of the drift, which was unfortunate—

The Court: This was on the approach of the tunnel?

(Testimony of Lewis Michael Larson.)

A. This was on the approach of the tunnel.

Q. From which end?

A. From the west end.

Q. That was out in the open?

A. That was out in the open. That was a prospect drift to which I referred yesterday, and in the removal of that we found some resistance, but outside of the drift very little resistance, and the tendency of the material to cave outside of the right-of-way line.

Mr. Marrin: Q. Did these slides delay the excavation of the cut any?

A. Yes; we removed considerable extra quantity of material which has been roughly estimated as 20,000 yards; to remove [606] that much material and having these slides, menaces, obstructions to our progress necessarily increased the period of time and incidentally the cost of the work.

Q. I show you, Mr. Larson, a series of 11 photographs dated from July 7 to August 8, 1934, can you tell us what those show without trying to describe each one? Just describe them generally.

A. They illustrate very graphically pictures of the conditions that were encountered in this approach cut to which I have just referred.

Q. And the slides that occurred there during that time?

A. The slides that occurred there, yes.

Mr. Marrin: I will offer these photographs in evidence.

(Testimony of Lewis Michael Larson.)

Mr. Tinning: How many are there?

Mr. Marrin: There are 12. Haven't you twelve there?

Mr. Tinning: Twelve sheets or twelve photographs?

Mr. Marrin: There are 12 sheets.

(The photographs were marked "Plaintiff's Exhibit 39.")

[Set forth in the Book of Exhibits at page 264.]

Q. When did you commence the excavation of the West Portal Cut?

A. The exact date I have forgotten, but it was sometime in June.

Q. Can you state when you completed the excavation of the West Portal Cut?

A. Approximately the 28th of July we figured getting up to the portal of the future tunnel. [607]

Mr. Marrin: Q. Did you excavate any of the portal sections with the open cut method?

A. I tried to excavate, as an open cut, a section of the tunnel at the west portal. I carried the excavation on for a distance, as I recall it, of about 8 or 10 feet.

Q. Did you stop at that point?

A. I stopped at that point.

Q. Will you explain why?

A. The tendency of the material to run, not only beyond right-of-way lines but to run to the point where it might possibly endanger traffic on the old

(Testimony of Lewis Michael Larson.)

Tunnel Road, and enlarge the amount of material that would be necessary to move, thereby making the operation both dangerous and uneconomical, caused me to stop the excavation of the portal section at this point.

Q. Do you remember about what date you stopped that excavation by the open cut method?

A. As I recall it, it was July 28th.

Q. That was caused by the character of the ground; that ground would not stand under open cut?

A. It would not be economically feasible, and it would be dangerous to traffic.

Q. When did you commence the actual excavation of the tunnel, Mr. Larson?

A. I started the excavation of the tunnel on August 1st.

Q. How long did you continue excavating the tunnels? A. Until about August 10th.

Q. Why did you stop at that time?

A. The subcontractor, K. E. Parker, who was putting up the portal buildings, stated that our operations interfered with his construction of the portal buildings—May I describe the part we played in the portal buildings, along with this?

Q. Well, state the location of the portal buildings.

A. The portal buildings,—including the transition section, which will have to be considered as part of the portal buildings,—were erected at the

(Testimony of Lewis Michael Larson.)

portal to the tunnel; or, in other words, it adjoined the tunnel.

The Court: Q. This was a subcontractor?

A. Yes. [608]

Mr. Wittschen: I believe it should be brought out it was your subcontractor.

Mr. Marrin: Yes, it was our subcontractor.

The Witness: Yes, our subcontractor.

Mr. Marrin: Q. Was the portal building in the cut?

A. The portal building was in the cut, yes.

Q. At the west end of the tunnel?

A. Yes.

Mr. Tinning: With reference to this subcontracting: the work was also subcontracted on the excavation of the portal building, was it not?

Mr. Marrin: Well, the witness can state that, I think.

Q. Will you state what the situation was with respect to the subcontracting of the excavation on the portal buildings and the work the subcontractor did, up until the time we took the work over on the tunnel end?

A. McKinley and Crowell had subcontracts for excavating the approach cut, and K. E. Parker Company had the subcontracts for erecting the portal building when the cut was completed, with the power unit.

Q. What do you mean by "power unit"?

(Testimony of Lewis Michael Larson.)

A. By Caterpillar tractors, by Bulldozers and power shovels. We realized, at that time, that it would be necessary to push, as rapidly as possible, the construction of the portal buildings; and, in order to expedite this work, realizing the subcontractor was not equipped to travel as rapidly as we would like to have had him do, we proceeded with the excavation of the footings, trenches, to receive the footing concrete for the portal building. We carried that on for 24 hours a day, with all the force that we could put in there, in the way of men and tools. That was done, with a view to expediting this particular work, because, at that stage of the time—or, of the work, it was very apparent there were two very important things to be done: one was to get the [609] portal buildings up, so we could backfill and support the walls that had a tendency to slide; and another one was to get the tunnel far enough underground before the seasonal rains hit us, so we could carry on during the winter, realizing, if we failed in that, we might lose not only the portal building slope, but we might find it impossible to go underground in the condition that we found the ground at the portals.

Q. That was taking over the subcontracting work from—— A. McKinley Crowell.

Q. Yes? A. Yes.

Q. You spoke of the portal building being subcontracted. To whom were the portal buildings subcontracted? A. K. E. Parker Company.

(Testimony of Lewis Michael Larson.)

Q. Six Companies did not take over the work in connection with that?

A. No; they did not.

Q. Can you explain why—Well, before I ask you that, I would like to show you this photograph, and ask you what that represents.

A. That represents the beginning of excavations for the tunnel at the west portal; and it also represents the excavations that I have just spoken of, of the trenches for the footing concrete for the portal buildings.

Mr. Marrin: I will offer that in evidence.

(The photograph was marked "Plaintiff's Exhibit No. 40.")

[Set forth in the Book of Exhibits at page 276.]

Mr. Marrin: Q. Will you explain the conflict between carrying on the commencement of the tunnel work and the completion of the portal building?

Mr. Wittschen: May I have that read?

(Pending question read by the reporter.)

Mr. Marrin: I believe he mentioned that it was held up. I wanted him to explain the reason.

Mr. Wittschen: You are not charging us with that, are you?

Mr. Marrin: I am not charging you with anything, Mr. Wittschen. [610]

Mr. Wittschen: Very well.

The Witness: A. The reason it was held up: K. E. Parker, Subcontractors,—they could not proceed with the speed that we were asking of them. If

(Testimony of Lewis Michael Larson.)

we continued to interfere with their operations, by hauling this muck over the structure that they had to work on, it was very apparent to us that they could not—and, consequently, we suspended the operations, because it was more important for them to get the portal building up than it was for us to start on the tunnel.

Q. How long were the operations, before commencing tunnel construction, suspended for that reason?

A. Until August 23rd. I would like to answer, in connection with that, what we did, on the portal building, to expedite it. I think it ties in properly with this.

Q. Proceed.

A. When the portal foundation concrete was placed and the reinforcing steel sticking out of these footings for the concrete of the walls, we had been fortunate up to that point in guessing that the side walls would stand. Almost immediately after this concrete was poured, a slide came from the north side, over this footing concrete. We cleared that away; and in an effort to still further expedite the construction, we arranged with the District to permit us to use quick-setting cement, and put the cost of the difference to our own account. In addition to this, it became very apparent that some support would have to be given to those side walls of the cut, because men were working immediately below those menacing walls; and it was not only for

(Testimony of Lewis Michael Larson.)

the sake of the men but for the sake of the construction, that it became necessary. Consequently, I placed breastboards along the wall of the cut on each side, and we furnished the Parker Company with the timber and paid them for making shores between the two walls, meeting those breastboards that I had placed against the walls of the cut. The reason we did that, instead [611] of carrying it on ourselves: they had to do the erection of the walls of the portal building, and it would be a conflict; we might place one of the stulls where it would be immediately in their way. In order to concentrate the work in the hands of one party, we paid the Parker Company for doing the erection work and supplied them with the material. He carried that construction across between the walls,—which was quite a considerable distance—approximately about 120 feet. Those shores had to be carried to safeguard the sides of the cut against going in on the portal building. After the portal construction was erected, we induced the Parker people to work with all the force that they could work, in order to expedite the construction of this portal building, the purpose being to get the side walls up and the first floor on above the subgrade, the walls being vertical walls and not having any cantilever or counterfort subsections; so it was not safe to count on, as that was unsupported. It appeared that it would be very important to get the first floor above subgrade placed; also, so the backfilling of the wall could be pushed as rapidly as possible. By getting that back-

(Testimony of Lewis Michael Larson.)

filling done, it would reduce the hazard of this material to fall, even though the slope maintained would be the same; the elevation would be less, and, if it did slide, it would have a flat place to slide against before it reached the portal timbers, instead of coming directly against the portal timbers.

Q. When did you get to the point of recommencing excavation on the tunnels themselves?

A. My recollection is it was on August 23rd, when we resumed operations, and that was on the south tunnel.

Q. All of these dates, which you are speaking about now, refer to 1934?

A. These are all 1934, now.

Q. Will you state, Mr. Larson, what you did in connection with the excavation of the tunnels, from the time you commenced—Was it [612] August 25th, or 28th? A. August 23rd.

Q. —1934, until you stopped excavating and poured the first concrete?

A. We began, on the south tunnel, on the 23rd day of August, or approximately that; that is my recollection—with the two lower drifts that were indicated this morning. We started in with the purpose there of trying to find what I still believed would be found: self-supporting rock. I proceeded with the lower drifts to the point where it was safe for men to begin excavating for the second drift,—the second drift being the one immediately above the two lower drifts. Those are the lower drifts

(Testimony of Lewis Michael Larson.)

there. There were two; one on each side; one drift here, and one here. These are the drifts (explaining chart to the Court.)

Mr. Marrin: Let the record show the last question related to Exhibit No. 40.

The Witness: The condition of the ground indicated to me that it would be necessary to increase the number of drifts and to shore them and to work a closer spacing of the timber than that which had been contemplated. I had not gone very far until there was a tendency of the hill to try to slip down upon us. We tried to counter that; and I countered it by putting braces from the posts and the cap down to a concrete strut that ran between the walls of the portal building, to find the positive position for the end of our shores.

Q. I show you a drawing which is entitled "Typical West Portal Bracing"; and ask what that illustrates.

A. That illustrates the shoring that I found it necessary to put in to support the structure against the tendency of the hill to come toward the portal building from the line of drive.

Mr. Marrin: I offer that in evidence.

(Drawing marked "Plaintiff's Exhibit No. 41.")

[Set forth in the Book of Exhibits at page 277.]

[613]

Mr. Marrin: Q. Mr. Larson, will you just explain to the Court what you did in bracing the timbers in the drifts?

(Testimony of Lewis Michael Larson.)

A. This line is the east line of the portal building that was first in process of construction, progressively increasing in height. At the time we began this lower drift excavation, it had reached an elevation of about, possibly, 15 feet, or maybe even at 20 feet—I have forgotten the elevation; and the shores, that I mentioned as having been placed against the posts and the cap of the drift, are illustrated here, and brought down to find its support against the portal building footing.

The Court: Q. Was the hill giving way?

A. Yes; it had a tendency to slide this way, and we were driving in this direction. I found this was insufficient, because the weight of this material and this shore in here had a tendency to lift that post up; I had to drop in and put in additional collar braces on the face of the lower drift, and put these extra braces, or longitudinal braces, in to counter against that tendency to run. As that work progressed in the lower drift and reached a point where we could begin on the second drift, I found the same condition prevailing; there was a tendency all the time for the hill to come against the line of drive. I loaded the top drift, to give as much weight as I could give to these timbers, and, by having additional shores over to the portal building, as these different drifts were opened up; and when I came to a point which is about as high as was convenient to have more shores, I put a series of shores from the portal building, and I found, at

(Testimony of Lewis Michael Larson.)

that point, that the shores then had become so long it was necessary to tie them laterally as well as in their vertical supports. I contemplated to run this way and run toward the portal building, and it was so severe that I found it necessary to continue putting in braces to counter that thrust inside the drifts themselves; and, [614] in order to get a full support over the wall tunnel, I placed timbers across that would catch the drift from the right-hand side and the left-hand side, and carried shores, from different points along that timber, to the portal building. Then the shores began to buckle and took a position much like a bow. By the time I had got into the fourth drift—keeping in mind that the lower drift is number one, the next above it is number two, the next number three, and then number four—I found I had not succeeded in stopping the hill. I had countered with timbers put in at 4-foot spacing. To keep the spacing from the sides, I found it necessary to put in wall plates.

Q. Had you, at that time, had any wall plates in your plans?

A. No; I had not planned on shores or wall plates; diagonal bracing; only enough to support as was necessary, because I thought it would be very much different kind of ground.

The Court: Q. How long did this condition prevail? A. This condition——

Q. Just on the approach?

(Testimony of Lewis Michael Larson.)

A. Yes. I will bring it up to that point. We got in the first 12 feet, and then No. 4 drift on the south side,—the south tunnel,—and had opened the two lower drifts in the north tunnel, and were just beginning the excavating above the second drift in the north tunnel, when it became so menacing above, I pulled the men out of both tunnels, and I placed additional supports,—put in such additional shores as were possible; and I could see it was coming; and, about ten minutes after I pulled the men out, about 2000 yards came down from over the portal of the tunnel, closing the drifts.

Q. Had you figured on that?

A. Well, I had figured that first slide.

Q. About what date was that first slide? Can you fix the date? [615]

A. This would have to be a guess,—an estimate —About the 15th of September, I would say. I did not keep any date on it. I am just guessing at the time it would have taken to do that much work.

Mr. Wittschen: Q. The 15th of September, 1934?

A. Yes—that is just an estimate; I don't know whether I am within a week of the correct date.

Mr. Marrin: I think that sufficiently explains that. At this point, I would like to offer in evidence, for illustrative purposes, this poster, which is on the easel, in connection with the testimony that is coming up from this witness and others. It shows, Mr. Tinning, for your information, the various

(Testimony of Lewis Michael Larson.)

methods used in excavating, and the places in the tunnel where they were used.

(The poster was marked "Plaintiff's Exhibit No. 42.)

[Set forth in the Book of Exhibits at page 278.]

Mr. Marrin: Q. Mr. Larson, would you proceed and explain the method of excavation which you used in this first part of the tunnel and any difficulties encountered? In doing that, would you refer to any of these exhibits or models which will illustrate your testimony?

A. This, your Honor, marked "A" on Exhibit 42, shows the method used in excavating the first 92 feet; that is, from the point where we began until we reached a distance in 92 feet from the portal building on the south tunnel, and a distance of 110 feet from the portal building on the north tunnel. The same method was used in showing the two lower drifts; two second drifts, third and fourth, and so on—and the top drift; showing also, in a rough way, the stulls that were necessary to hold the segments in their positions.

Q. How did that differ, Mr. Larson, from the method which you had planned to use in the west 40 feet?

A. I had in mind, there, to use a reduced lower drift; I thought it would be necessary to go in only 40 feet; consequently, I would not need to make as large a lower drift. I may say the reason for it is this: this drift work is [616] always more costly

(Testimony of Lewis Michael Larson.)

than any other method that I know of; consequently, leave as little material in the drift as possible; leave as much material in the core—which is what we term "cheap muck." I had planned to use a total of 11 drifts, to make the circumference, instead of 13, which I was compelled to use on account of the condition of the ground. These segments were planned to be 7 feet, approximately; they were reduced to about 5 foot 3, in order to give strength, and still at the same time to leave room enough for men to work not at too much disadvantage.

Mr. Tinning: Q. Mr. Larson, may we, for the purpose of keeping some measurements here, follow the stations in which these various parts of the construction were carried? For instance, this 92 feet: what station would that be?

A. That would be for the south tunnel; about 112 plus 45.

Mr. Marrin: Q. I want to direct your attention to the longitudinal drawing appearing on Plaintiff's Exhibit 42. By the way, will you, for the benefit of the Court, explain what is meant by an "engineer's station"?

A. An engineer's station is a unit of measurement. The first station is "0", "1", "2",—which indicates 100, 200, 300, and so on.

Q. 100 what? A. Feet.

Q. In other words, there are 100 feet between stations? A. 100 feet between stations.

(Testimony of Lewis Michael Larson.)

Q. Your first station is No. 1. The distance between No. 1 and No. 2 would be 100 feet?

A. Yes.

The Court: Q. Does that show on that drawing?

Mr. Marrin: The stations are shown here.

Q. Will you point out the stations to the Court?

The Court: For the purpose of the record, I would like to have the witness describe, in his own way, what this chart depicts, [616-½] generally.

Mr. Marrin: Q. Can you explain that?

A. I can; I can explain the whole thing, although I was not on the work for the whole period.

Mr. Wittschen: It might be well to show the station starting at the beginning.

Mr. Tinning: 2½ miles down the road. We will stipulate to that.

Mr. Marrin: Will it be stipulated the first station under this contract was located approximately at Keith Avenue and Broadway?

Mr. Tinning: The west end of the project, certainly.

Mr. Marrin: And about 2½ miles from the westerly portal of the tunnel.

The Witness: The westerly portal, the station on the west portal of the north tunnel was 111 plus 42.55, and the west portal of the south tunnel was at Station 111 plus 53.25.

Mr. Marrin: Q. When you say 111 plus 53.25, that means what?

(Testimony of Lewis Michael Larson.)

A. That means 111 stations, of 100 feet in length, from the beginning point of the project, for this contract plus the fraction of a station.

Q. You say 111 plus 53.25 means 111 stations plus 53.25 feet?

A. Feet; correct. The excavation on the south tunnel, I believe I had indicated, stopped at approximately Station 112 plus 45; on the north tunnel, at approximately Station 112 plus 53.

Mr. Wittschen: Q. You would wish to correct that, wouldn't you? You gave it 111, before, plus 53. It is——

A. 111 is the station. 112 is what it should be; that is the stopping point on excavating for the first lining, the portal being at 111 Station.

Mr. Marrin: Q. Will you explain, generally, to the Court, what that diagram represents?

A. Yes. This, Your Honor, represents——

The Court: What diagram? Identifying it, for the record. [617]

The Witness: A. Exhibit 42. The section marked "A" is a cross-section of the method used in the first excavation of the full drift method that has been delimited by the station number.

Mr. Marrin: Q. How is that shown on the longitudinal section of the tunnel?

A. That is shown by this blue color, by the index "A" indicated in the blue. The next, Section "E", shown—also illustrated by a cross-section, shows a distance of approximately 42 feet in

(Testimony of Lewis Michael Larson.)

the south tunnel, following this first excavation. That would work out—If someone will work out the mathematics for me——

Q. Well, you don't need to be so accurate on the number of feet.

The Court: Well, if you want to do that, we will take a recess for five minutes.

(Recess)

Mr. Marrin: Q. Will you explain what this represents,—this poster?

A. The poster marked "B" represents——

Q. You are referring to Plaintiff's Exhibit 42?

A. Yes, 42, section marked "B" represents the wall plate method as used in that section represented by the "B" here. "C" illustrates the method used in this section of the north tunnel indicated by the mark "C." The "D" represents the section used in the north tunnel indicated by the legend "D." "E" represents a section of the south tunnel, represented by a cross-section indicated by the legend "E." "F" represents the section in the north tunnel and a section in the south tunnel, both indicated by the legend "F,"—a cross-section indicated by the legend "F." "G" represents a section of the north tunnel indicated by the legend and cross-section marked "G." "H" indicates a section of the north tunnel indicated by a cross-section and legend marked "H." "I" indicates a section of the south tunnel, excavated by the method indicated in the

(Testimony of Lewis Michael Larson.)

cross-section also [618] marked "I." "K" indicates a section in both the north and south tunnels near the east portal, indicated by a cross-section with the legend "K."

Q. What does the white portion of the longitudinal section of the tunnel represent?

A. The white portion between the colored portions indicates the part that was not completed by the Six Companies.

Q. Will you point out, in those systems represented on Section 42, what would be known as the "wall plate system"?

Mr. Wittschen: Mr. Marrin, before you leave that, were you going to put the time element in evidence? In other words, during the period of time these various things were done——

Mr. Marrin: That will all be shown in detail by following witnesses, Mr. Wittschen. I had in mind simply giving a general description for the information of the Court as to what this exhibit represents, and thereafter Mr. Larson will testify in detail as to the part he excavated.

The Witness: A. The wall plate method, your Honor, is indicated by the cross-section marked "B", legend "B", the cross-section of the tunnel with the legend "C", the cross-section of the tunnel with the legend "D", and the cross-section of the tunnel with the legends "G", "H" and "K." [619]

Q. Which of those sections there represents the circumferential drift system?

(Testimony of Lewis Michael Larson.)

A. Legend "A".

Q. What do the others represent?

A. The one represented by "E" is a short section that was driven in the south tunnel whereby the excavation was moved from the two outside edges of the tunnel by one vertical drift on each side, the top drift which was in the mud section, and then by what we term the ring, whereby the excavation was shot down into the lower drifts.

Mr. Tinning: Q. What do you mean by the "mud section"?

A. We found mud in the south tunnel.

Q. You are referring to the material?

A. I was referring to the type of material that we encountered.

The Court: Q. You encountered that material at that point?

A. Yes. "F" section represents a method pursued whereby the two lower drifts were advanced a certain distance ahead of the two drifts immediately above. This did not always hold true, for the reason that bad material was encountered in the lower drift, and it was necessary in one or two instances to pass the second drift over the point where the trouble had occurred in the lower drift in order to stop the run of material into the lower drift. In general, the lower drifts were advanced first, the second drift following, and then the ring taken out as one operation, and the core as the last operation. "G" section indicates the removal——

(Testimony of Lewis Michael Larson.)

Mr. Marrin: Q. Did you describe that as the wall plate system?

A. Yes, I have already described it. The "I" system indicates the removal of material from a lower drift, two lower drifts, with two second drifts above and two thirds above.

Q. And then the ring was taken out?

A. Yes, and then the core.

Q. You have mentioned and pointed out these different diagrams, Mr. Larson, as the wall plate system. Do any of these represent the [620] wall plate system which you contemplated using when you estimated the work?

A. With certain modifications, yes. Type "B" represents approximately the method that I had in mind, with this exception, it was necessary on account of the formation we encountered to drive the top drift along with the two wall plate methods, which varied it from a wall plate; it became necessary to drive this below the wall plate, and support the ground by spiling on one side on the outside of the tunnel by spiling or breastboarding the core and by breastboarding that portion of the drift that lay immediately below the wall plate; therein it differed. Does that answer your question?

Q. Those are simply modifications of that system? A. Modifications of that system.

Q. Will you proceed, Mr. Larson, and explain to the Court the excavation of the first 92 feet in

(Testimony of Lewis Michael Larson.)

the south tunnel and the first 110 feet in the north tunnel?

A. I believe I had reached a point where I had begun the second drift in the north tunnel and had proceeded a certain distance in with the fourth drift in the south tunnel when that slide of material came from the face of the tunnel. It would probably be proper to drop back and state that in the south tunnel, No. 3 drift, I ran into a rather soft mud formation where it was necessary to resort to this method of driving spiling as explained earlier.

The Court: Can you indicate it on the chart?

Mr. Marrin: The location of it?

The Court: Yes.

A. The location of the drift—this is the drift to which I refer.

Mr. Marrin: Where is that, referring to Plaintiff's Exhibit 42?

A. That would be in the "A" section near the west portal.

The Court: I understood that is where it was but I wanted it in the record. [621]

A. About the time that I began driving the two No. 4 drifts I had got the two second drifts well started in the north tunnel, but in the No. 4 drift on the right-hand side of the south tunnel, this mud, soft mud condition continued forcing the driving of spiling and breastboarding to keep the mud from running into the drift; I began to encounter mud

(Testimony of Lewis Michael Larson.)

also in the fourth drift on the north side of the south tunnel, where spiling was driven, but the material was not so soft that the breastboarding was necessary. That mud continued in to the fifth drift and the top drift of this same tunnel, and we would drive the spiling on the outer rim and do just a little breastboarding, because the mud had a tendency to stiffen at the point where it would not actually run in on us, but it carried so much weight that it was necessary to put stulls from the segments down to the core, and we found some difficulty in supporting it in that position because the core contained mud and I had to take in big wide foot blocks, that is lumber with considerable width in it, to keep the weight of the material above from pressing the post down in through the core. On the north tunnel—I will finish with the south tunnel first, however. By the time that I had got the fourth drift started, as I recall it, and the crews had reached a point in the south tunnel where it appeared that we were going to find self-supporting rock, it was a sort of resistance point, and I was looking for it, because the season was becoming so far advanced that the rains might be expected in a very short time, it was important to find that hard place and get the excavation stopped and the concrete in to support that portion of the tunnel. When I found that I stopped the crews in that portion and began the excavation of this fifth and the top drift, and one each of the following drifts, 2, 3, 4,

(Testimony of Lewis Michael Larson.)

5, in the top drift, all the same distance in from the portal, a distance of 92 feet from [622] the portal; I stopped during excavation on the south tunnel and began immediately to prepare for concrete. In the meantime excavation continued in the north tunnel; I was a little disappointed in reaching the distance that would be equivalent to where this firm material had been reached in the south tunnel, and had not found a similar condition in the north tunnel. I carried on to a distance of 110 feet expecting every time I excavated that I would encounter hard material. A point was reached where I could not continue to drift any longer for fear of not being prepared in the north tunnel for concrete by the time I finished the concrete lining of the portal section of the south tunnel, so I stopped at a distance of 110 feet on the lower drift. In the driving of that tunnel the condition was a little bit different. The material was badly broken, but it was not of the muddy and soft running type; it did not require the driving of any spiling, but it did require very careful handling because of the broken nature and the fault that ran through in different sections of the north tunnel, and I found that we had a handicap in getting the necessary help, it was a most dangerous and difficult portion of the tunnel, and the lack of experienced help—we had to employ through the National Labor Agency; the conditions of employment first were to hire ex-service men and then men with families

(Testimony of Lewis Michael Larson.)

without very much regard to whether or not they fit the work; however, we managed to get through it without any mishap. We had one run in the third drift of the north line, third drift on the right; that was the only menace that we had from material that got beyond control, and it did not amount to a great deal, but we did have a difficulty that developed on the left-hand side of the north tunnel. As we proceeded there a fissure opened in the material, itself, at a distance, as I recall now, of about probably 15 feet to the north [623] of the tunnel. I don't know that we have any pictures that illustrate that, but as we proceeded to go in there that fissure became more and more open, a terrific weight came onto our tunnel at that point, requiring me to carry stulls from the segment over to the core to find support against the core to keep the timber from collapsing and the tunnel from going out. That fissure developed to a point where I used it as a chute for broken material for back-filling the building; and when that weight was transmitted by the breakage of that cleavage, of that crevice, throwing the weight of that portion of the hill onto the side of that tunnel, it required quite a little bit of tunnel support to keep the segments from coming in; some came in as much as ten inches, as developed later when I poured the concrete we had to do a lot of trimming. When we reached a point with all drifts 110 feet from the portal the excavation was stopped on that tunnel, too, and we began

(Testimony of Lewis Michael Larson.)

immediately to prepare for concrete. I will drop back now into the south tunnel. In the south tunnel, on account of not being able to hold the excavation with timber without leaving the core in, it was necessary to find some means of concreting leaving the core, because the core was necessary for the support of the structure, and, later on, for the support of the concrete forms, and consequently I erected some wooden forms in the different drifts and covered those wooden forms with metal, which was required to give a smooth surface to the concrete; when the forms were erected and we began concreting—I should say we had reinforcing rings put in there; the method we had thought would be used was the A method, which indicated one line of reinforcing steel on the inner circumference of the lining, and two rows of reinforcing steel were placed, and when the pouring began we poured a distance of five feet six inches in height in each of the two lower drifts [624] by means of buggies; I had a concrete mixer on the outside and we used buggies, concrete buggies, for transporting the concrete into the forms. When that section was poured up to the five-feet six-inch line I proceeded to pour concrete by means of a Hackley gun that has just been described, by passing a pipe over the top of the form at the center. We immediately ran into a difficult situation there, to deflect the concrete down the two side walls and to meet the conditions of the specifications, which were that the concrete must

(Testimony of Lewis Michael Larson.)

not drop more in a vertical distance than six feet, if it were not in an enclosed pipe, and that it must not be moved more than three feet either way from the point of placement. Under the conditions which prevailed it was difficult. The District Engineer saw our problem and permitted us to bulkhead a distance of about 20 feet, which meant that we could move the material farther than we had first feared it would be necessary. Now, in the placing of that concrete, in the deflecting of the concrete we put a baffle box up there to try and split the concrete and try to get it to go both ways, but when we came to deliver through a pipe with 100 pounds of air behind it and then tried to deflect it, the result was our pipes would plug and the stuff would collect and build up over the center line and not find its way down the elephant trunk. We had quite a struggle and finally managed to get the wall up a distance, as I recall it now, of about eight or ten feet beyond the first pour that was made, when it became necessary, by the orders of the District Engineer, to scrape the cement that had spilled from the force of its delivery over the reinforcing bars and had lodged itself on the forms that confined the concrete. My recollection is I built a key wall at that point—by a key wall is meant inserting a piece of wood or other material that will form a sort [625] of sand bar or something similar to that, so that when the next concrete pour is made on top of it there will be no tendency to side slippage. We

(Testimony of Lewis Michael Larson.)

finally managed to get the wall poured up to the point where the engineer permitted us to do it from the top and fill it from the center pipe.

Q. When you say "the engineer," what do you mean?

A. The District Engineer or his representative. I have that in mind. At that time, and prior to that time, we found that considerable trimming of the sets was necessary because the weight of the structure above forced this timber in. I neglected just one thing that may be important to drop back to here; when we reached a point almost to the end of our excavation in the south tunnel several large cracks began to develop on the hill back of where the first slide came, and I realized that from the state the tunnel had been in and the weight of the forces were bearing in on the timbers, they were acting, if another slide came I would lose the whole tunnel. Consequently we got the nearest and the quickest drag line that it was possible to get, built a temporary road from the old tunnel road down over the portals of the new tunnels which were being excavated, brought a "cat" and bulldozer down, and by working 24 hours a day we managed to remove the menacing slide, dragging it as far back as possible with the drag line and bulldozer and cat pushing it from the point where it was a menace. That relieved the weight on the south tunnel, but not sufficiently to prevent the remaining weight shoving our timbers down within the con-

(Testimony of Lewis Michael Larson.)

crete line, and to trim those timbers with reinforcing steel within three inches of them, or more than two inches of them, was very costly, slowed up the progress, but it was necessary to keep the timber outside of the concrete line. After having poured that first 20 feet we put in another bulkhead. I should have said that we began [626] the pouring from the inside, the farthest distance in, that is 72 feet approximately, and that gave a sense of security because it would have a tendency to check any further slide over the most vulnerable section of the tunnel. I then erected a bulkhead in there approximately 20 feet toward the portal, and by using the same method succeeded in pouring the next section of 20 feet. The next pour was approximately 12 feet. By the next, I mean pouring from the previous concrete that had been finished, and completed the arch, which was 12 feet from the slope of the hill out to the edge of our concrete, and reduced the menace. That left approximately 40 feet of the arch of this south tunnel to be poured, which was done by hoisting the concrete up to the floor line of the portal building and using buggies from that point to convey the concrete into and upon the forms of this open section, thereby completing the pour of the lining for 92 feet, and the portal section. Just as soon as that was completed I began pouring the north tunnel. Meanwhile, while we were doing this other work in the south tunnel I had prepared the north tunnel for the receipt of con-

(Testimony of Lewis Michael Larson.)

crete by erecting the forms, getting the reinforcing steel in, getting the pipes, the concrete delivery pipe, which is a 6-inch pipe that led from the Hackley gun to the point of discharge, that was installed, and we were permitted at that point to place a pipe in each wall. I will drop back and state that in the first pour it was not permitted, that is, we would pour one wall at a time and then pour the next wall. I tried to put that point over——

Q. Not permitted by whom?

A. By the District Engineer or his representative, and consequently we poured one foot on one side and then shifted to the other side to pour that; we were permitted to finally pour four feet on each side and then shift our concrete [627] operations over to the other side and pour four feet, but there was one handicap in the delivery of concrete by the pneumatic method, that you cannot work very close to that, because it is much like working in front of a Gatling gun, the men have to be in the forms while the concrete is being delivered and then the concrete operation held up while the men get into the forms and vibrate—by "vibrate" I mean a manufactured vibrator that is operated either by electricity or by air, that causes the concrete to move into all sections of the form and compact the concrete. To do that it was necessary to stop the delivery of concrete each time it was necessary to do that vibrating, which prolonged the period of time for the concreting of this portion of the tun-

(Testimony of Lewis Michael Larson.)

nel, as I recall it, for twenty days, from the time that the excavation was stopped until the concrete operation was finished. The District Engineer permitted us in pouring in the north tunnel to go to a point about fifteen feet above sub-grade, enter the pipe in each of the two walls and pour one wall at a time. This was a very big help, the conditions being that as we poured the wall and the concrete came toward the portal you could use the same method of beginning at the farthest extended part of the tunnel and bring it out toward the portal. As it built up in the wall at the farthest point distant from the portal we took off sections of pipe, five-foot sections in most cases, and kept shortening the delivery pipe until that wall was completed to the elevation the Engineer permitted, and it was keyed at that point by a wooden key that could be later removed. Then the other wall was poured to the same elevation and keyed. The next operation was to pour from a point at a little distance below where the concrete would flow from the arch. At that point we built another bulkhead with the key in it and put the pipe within the bulkhead and began the delivery of our [628] concrete through that in that position on one side and then shifted to the other side. With this method of delivery it was possible for the vibrator to work continuously in advance of the delivery of the concrete and it shortened our operation materially. We succeeded in building that section by the delivery through those

(Testimony of Lewis Michael Larson.)

four pipes and the final closing at the top in a period, as I remember, of twelve days; and I also recall distinctly that the last few yards were poured in a very heavy downpour of rain, at the beginning of the rainy season. We just got out in time. The reason for having to change our method of pouring was due to the fact that the structure could not stand without the core in there for support, because the plan that I had indicated in my estimate for pouring could not be used, because you could not get your forms in; the forms traveling on a carrier would be obstructed from getting in by the core having to be left in position. In my thought on the estimate it did not occur to me that the condition of the ground was such as it developed to be. I was looking for self-supporting ground. We were always hoping that would be found. When the completion of the pouring was done we received orders from the District that the core must not be removed until the concrete had reached a stage of curing for 21 days after placing; consequently, having the drift full of timber, and requiring the core for support, it was impossible to carry on with the excavation without first removing the stulls and the supports that were holding the forms. I should state in that connection, too, in the pouring of the north tunnel, where we had developed that terrific pressure from the left-hand side, that we had as many as three stulls of 4 by 4 on that little short 5-foot-3 segment to the core to prevent that terrific weight

(Testimony of Lewis Michael Larson.)

from crushing in, and in spite of that some of our segments moved in as much as ten inches and we had [629] to trim back of the double row of stulls; it was both tedious and difficult, and when we did pour the concrete we had to bring the concrete up to the point where it practically enclosed these stulls before we were compelled to get it out and when we did get it out it would twang like a violin string or a guitar string, showing the terrific pressure that we were carrying. That practically completed our operations in that tunnel.

Q. Was any of the ground encountered in this section of the tunnel self-supporting?

A. Decidedly not.

Q. I think you stated you started the excavation of this section of the tunnel about August 28, 1934?

A. On the south tunnel that is as near as I can recall the date; on the north tunnel on September 1.

Q. Do you recall when the excavation was completed in the south tunnel?

A. I think the excavation was completed in the south tunnel approximately on October 13, as I recall it now.

Q. 1934?

A. 1934; and the concreting requiring 20 days, would be about the 5th of September, would it not?

Mr. Tinning: Q. November.

A. November.

Mr. Marrin: Q. In the time between the placing of the timbers in the drift and the commence-

(Testimony of Lewis Michael Larson.)

ment of the concreting operation, had the timbers moved any?

A. Yes, they were moving in continuously in spite of the fact that we tried to hold them with stulls.

Q. And had to be trimmed before the concrete could be poured?

A. And had to be trimmed before concrete could be poured, most of them.

Q. These timbers had only been in a short time before concrete was placed? A. Yes.

Q. How large were these drifts?

A. The lower drift, as I recall it now, was about 9 feet high and about 10 feet wide. [630] The reason for making it of that size was it was developed that we might have to go more than the 40 feet, and consequently we would have to find some means of taking the muck out, and taking the muck with small cars was not possible; consequently, as a matter of getting 5-yard cars in there, and no smaller drift could be used for getting 5-yard cars. The other drifts were confined to the size that would be necessary to put the concrete forms in, the purpose being to leave as much of the cheap muck as we could in the core, and consequently that reduced the size of the drift, and to get the muck out of the drift into cars is a more costly operation, because that has to be done by hand, than it is to do the operation by power equipment.

(Testimony of Lewis Michael Larson.)

Q. Did the ground condition have anything to do with the size of the drift? A. Yes.

Q. What?

A. The ground condition controlled the size of the drift. The lower drift that I mentioned was made to a certain size for core surface but the rest of the surface used from 7 foot segments to 5 foot 3 segments and wall plate in there at the contact between all of the segments to aid along with the collar braces in keeping the structure as a unit; consequently, we had two additional drifts in each of the tunnels over what we had contemplated, and we had spacing of timbers at four feet instead of five feet, and we had wall plates extra, and every time we put in a segment that would have to be taken to the mill, because it had to be framed fanned, you have extra collar braces to cut, the wall plates have to be cut, you have many more boards to be handled, and it all adds to the cost, not only in the material, but it adds to the cost in time and the cost in money.

Q. Would you describe generally the character of the material in this section of the tunnel as it appeared to you?

A. In the [631] south tunnel it was broken formation, apparently sandstone, that is what I thought it to be; I am not a geologist. The fact that I name it something, it does not follow that I am right in naming it; that broken formation continued except in the top drift—I think the geologists would call mud some form of rock, but I will call

(Testimony of Lewis Michael Larson.)

it mud—we ran into mud in the third drift of the south tunnel, and the fourth drift of both sides of the tunnel; this refers to the south tunnel—and in the fifth, two fifth drifts and the top drift. In the north tunnel, I should mention that on account of the broken condition there it was necessary to advance spiling; it was not necessary to drive spiling except in the mud section; you cannot drive spiling in rock, you have to advance it.

Q. Did you do any breastboarding in that section?

A. In the south tunnel we breastboarded in the third drift and some in the fourth drift on the right-hand side, and on the fifth drift on the right-hand side, but on the left-hand side there was very little breastboarding because the mud was stiffer there, the water from above that I spoke of in the earlier part of my testimony yesterday, from this stream, a little creek that flowed down into the approach cut—however, we had cured that, or thought we had, but during the period of time that it had been going there it had caused disintegration of the material and that continued up to the point where we left off 92 feet in from the portal. Now, in the north tunnel the material was very badly broken, I think was a sandstone, but the same method had to be pursued, except that breastboarding was not necessary in that tunnel, but we had to be very careful advancing our spiling in that tunnel to prevent the material running away, and in

(Testimony of Lewis Michael Larson.)

one instance it did get away from us, not because of the condition of the material [632] as much as because we did not have experienced people who were working in the tunnel; I don't know what their vocation was, and it was a very dangerous condition, because the lives of the men depended upon the understanding of the operation by experienced help, and we had so little of it.

Q. Did the fact that you were required to place concrete first in one wall of the tunnel and then go over and place it in the other wall have any tendency to cause cold joints to form?

A. Yes, it did.

Q. Will you explain what is meant by "cold joints," first?

A. The concrete is supposed not to be continuously poured without a key being placed in it after it had been in the form for a period of thirty minutes; after that you think of it as a cold contact, and it was found impossible to transfer our pouring operation from one side to the other in that period; in fact, in one case I remember keeping time on it, and it took more than an hour and a half to get over on the other side; it was a very difficult and very slow operation.

The Court: We will take an adjournment now until tomorrow morning at ten o'clock.

(An adjournment was here taken until tomorrow, Friday, April 15, 1938, at ten o'clock a. m.)

[633]

Friday, April 15, 1938;
10:00 o'clock A. M.

LEWIS MICHAEL LARSON,

recalled for the plaintiff.

Direct Examination (continued)

Mr. Marrin: Q. Mr. Larson, you testified, yesterday, that the method you planned for concreting the tunnel was to use the pneumatic gun which you described. At the time you made your estimate, did you consider any other means of applying the concrete lining in the tunnel? A. I did.

Q. What method did you consider?

A. The method known as the "Pumpcrete."

Q. Would you describe briefly what that method is, and how it differs from the pneumatic gun?

A. This method, your Honor, is illustrated on the upper half of Exhibit 35. The forms are similar to the forms used, and the form carrier is similar to the form carrier used in the other method. The concrete is brought in, in much the same manner. It can be brought in, either in cars or in agitators. In this instance, it was brought in in agitators; the concrete comes in there, and is dumped into the pumpcrete outfit; and the pumpcrete outfit handles the concrete in a way different from the pneumatic gun,—for example, dispels it out at a violent force. In the pumpcrete, it is pumped the same as water. It is put into the pumpcrete gun, which has, in some cases, one cylinder, and in some cases, two cylinders.

(Testimony of Lewis Michael Larson.)

It is a safe method, because men can work in and about it without any difficulty.

At the time that the estimate was made up, this method had been in the experimental stage, having been tried out at the Boulder Canyon; and Mr. Stephen Bechtel, the president of the Six Companies, then of the W. A. Bechtel Company only, asked me if I had given it [634] consideration. I told him I had been hearing a great deal about it, but I did not understand that it had yet proven feasible. He suggested I get in touch with the Link Belt Company.

Mr. Marrin: The Chain Belt Company, isn't it?

The Witness: The Chain Belt Company—who were the agents for that method in the Western country. I called them up, and they sent over Mr. Nichols. This was some time—probably about the 10th day of March; that is as near as I recall the time.

Mr. Tinning: Don't you think, Mr. Marrin, this testimony should go in without hearsay as a result of this witness's investigation?

Mr. Marrin: Yes, I think so.

Q. Mr. Larson, you might simply testify to your investigation—that you investigated it, and why you did not adopt that method in your estimate, without saying the conversations with third persons?

A. The result of that conversation was—he told me—although there had been progress made in its

(Testimony of Lewis Michael Larson.)

use, and it was about the time when the bid must be put in, I was afraid to use that as the controlling unit in my bid; resulting in my adopting the pneumatic gun, which was in general use for tunnel work and the accepted practice up to that time.

Q. I think that covers it. You were describing yesterday, the excavation of the first 92 feet in the south tunnel and the first 110 feet in the north tunnel. You said the length of time that was included in your estimate for the excavating of those tunnels was what?

A. The first 40 feet, I had estimated to use 20 days for the excavation. By that time, the crews would be lined out and separated sufficiently far that it would be a going operation without interference from one part of the work to the other.

Mr. Tinning: Q. Mr. Larson, how many days did you say?

A. 20 days for the first 40 feet. In the drift system, I proposed, at that [635] time, to continue on with the wall plate method,—change to the wall plate method, and proceed with the excavating while the concreting was being done. My thought, then, of course, was that I could remove the core, and move this concreting unit into the tunnel and pour from steel forms. I had in mind, at that time, pouring the first distance of 40 feet from the outside of the tunnel, working from the 40 foot point in, and work toward the portal. By the time that was poured, I appreciated that my estimate of progress was right

(Testimony of Lewis Michael Larson.)

and would be a considerable distance ahead of the excavation, on the wall plate method, and would be in good time for lining, by putting my ramp between the face that was being excavated and between the forms. It was necessary, under that method, to have some means of backing up, to follow your excavating and also to fill from the previously poured concrete, back to a new bulkhead. That would have given me ample time, after the concreting had been done for the first section, to make those changes; and I could then proceed, if my estimates were right, both in progress of excavation and progress of pouring, an average of 10 feet per day of concrete; an average of 10 feet per day of concrete would be poured, to keep up with an estimated excavation of 10 feet. I required 92 feet of excavation in the south tunnel, instead of the estimated 40, on account of the nature of the ground; and the period of time on the schedule would have required 26 days for excavation, and, as a matter of fact, it took, I think, 60 days, or 62. The north tunnel,—the distance being a little farther in,—would have taken us, if the schedule had been kept up at the rate I figured—we would have had that done in 27 days; and, as a matter of fact, it took us something over 60 days—67—I have forgotten the correct time. I have my notes here, if I may refer to them.

Q. Were those notes taken from the records?

A. Yes. [636]

Mr. Marrin: Is there any objection to the notes?

(Testimony of Lewis Michael Larson.)

Mr. Tinning: No; we have no objection.

The Witness: A. —The record shows that the excavation, in the south tunnel, begun August 23rd, was completed October 13th. Allowing for the holiday of Labor Day, it meant 51 days. The core removal, from November 26th to December 8th,—an additional period of 13 days,—meant the requirement of a total of 64 days for this 92 foot excavation, the estimated time being 26 days,—a time loss of 38 days.

In the north tunnel, the excavation, begun September 1st,—as soon as we could get in,—was completed on October 27th; a total of 56 days; the core removal required 8 days; making a total time period of 64 days, as against an estimated period of 27 days, or a time loss of 37 days.

Mr. Marrin: Q. How many hours a day did it allow the plaintiff working?

A. On this work, it was forced 24 hours a day, every day that was not a legal holiday.

Q. During all the time you were on the work, was it going on for 24 hours a day?

A. With all the vigor we could give it, it was.

Q. After the lapse of 21 days, to allow the concrete in this first portion of the tunnel to cure, was excavating resumed?

A. As soon as the 21-day period was lapsed, excavation was begun in the south tunnel, which was the one that had been first concreted. Excava-

(Testimony of Lewis Michael Larson.)

tion was resumed on the core on the 26th day of November, according to the records.

Q. According to your estimate, Mr. Larson, and the date that excavating was resumed on these tunnels, how far would they have been excavated, had you been able to follow your estimate?

A. Well, I will refer to my notes again. The distance we should have been on December 12th, in each tunnel, was 1030 feet, if there had been no [637] delay, and had gone on as we anticipated.

Q. Mr. Larson, will you proceed to describe the excavation of the tunnels, from the point where you resumed excavation in December?—I might ask you, preliminarily: Were you in charge of both tunnels?

A. I was in charge of both tunnels up until December 8th.

Mr. Tinning: Q. Was that December 8, 1934?

A. Yes; this is all 1934.

Mr. Marrin: Q. After that date, what particular work were you in charge of?

A. I was then in control of the north tunnel; and Mr. Whitmire was placed in charge of the south tunnel.

Q. By being in control, you mean you superintended the work?

A. Yes, I superintended the work.

Q. During the period you were in charge of construction of the north tunnel, did you frequently visit the south tunnel?

(Testimony of Lewis Michael Larson.)

A. On an average of about three times a week.

Q. You were familiar with all of the conditions in connection with the excavation of that tunnel during that period?

A. I think I was thoroughly familiar with that.

Q. Will you proceed to describe the method of operation on the north tunnel, between the period when excavation was resumed and until you left the work on April 30, 1935?

A. As I previously stated, I had the core excavated, and brought it to the point very near the end furthest removed from the portal,—the end of the lining. The ground was in such condition that it was not safe to complete the excavation in a vertical position. I brought it to the end of the lining. I breastboarded the core, to prevent the slippage of material,—the rocks. After breastboarding, I began the excavation of the two drifts I described above, on the wall plate drifts on each side; and, at the same time, I began the excavation of the top drift; and, in excavating the top drift, because of the condition of [638] the ground, it was necessary to give support to the top. In ground that is heavy and uncertain and carrying weight, you have to raise your cap, corresponding in proportion to your results as to the weight you are carrying on the cap. For that reason, the top drift is driven, to prevent the ground from running into the drift; and also to give the necessary elevation to the segments that come up from the wall plate. When I

(Testimony of Lewis Michael Larson.)

had proceeded in a distance of about 20 feet, on the wall plate drift, a similar distance on the top drift, I proceeded to put the wall plate in position. I am a little ahead of my story. It should be stated: when I was in about 20 feet in the wall plate on the top drift, I then had to excavate this second drift immediately above the wall plate drift, continuing the other operations described in the two drifts next and in the top drift, and providing for the safety to the men who were working below. When those drifts immediately above the wall plate drift were advanced about 20 feet, I started another crew on the connecting drift with the top drift, and then went on with concreting and more excavation. These, of course, were duplicated on each side of the tunnel. When all the crews reached a point 20 feet in from the erected section and the timbers forming the arch had been erected, and the complete arch formed there, and the collar bracing, and all that is necessary to hold a structure in a firm condition, had been finished, I removed the breast-boards from the core, and began, with the power unit, to excavate the core. It is necessary you do that in order to get bracing under the suspended wall plates. We had removed possibly three or four cars of muck, with a shovel, when the core broke; and, as it sloughed down into the tunnel, it broke to a point where our arch approximately had ended. That was a fortunate point, because, had it carried further, it would have caused a collapse. As it was,

(Testimony of Lewis Michael Larson.)

no harm came from it; but it was evidence that it [639] was an unsafe distance, and, consequently, I stopped the excavating of the core, and proceeded to drive the wall plate and the remaining drifts for the wall plate in for a distance of another 10 or 20 feet; and I resumed excavating on the core again, but the core was in such condition that it was unsafe to remove it, as a unit, without some spiling. I started at the meeting point of the core and the wall plate, and began drifting down, in a vertical position, from the wall plate. As I did so, I breastboarded under the wall plate again. On the wall plate drift excavation, I placed spiling back of the concrete section, lining section, and breastboarded against the core. If I had not done that, the core would have collapsed, or the material from the drift would have collapsed and trapped the men who were working there. I had to carry the excavation clear on down to the point where I could put in any posts. I tried to carry about 4 foot spacings, when I contemplated 5 foot spacings would be possible, when I made the excavation to a point under the free end of the wall plate, and put in one 4 foot spacing against the breastboard that had held the material immediately under the wall plate and against the wall plate drift.

Q. The posts are for support under the wall plate?

A. For support under the wall plate, yes. They carry from the wall plate down to the subgrade.

(Testimony of Lewis Michael Larson.)

The timbers forming the spacing, at this particular time, were 12 inches by 12 inches. As I proceeded to excavate for the next section in the same manner, the weight began to become so heavy on the wall plates that I had to drop back and put in more posts, in a spacing of 3 feet that existed between the first and second posts; and finally had to make a solid back there. As quickly as I could put the posts in, the pressure from the top and from the sides had the tendency to force this in; and I proceeded, from then on, for a distance of 20 feet, putting the posts in almost solid. When I reached that point, the wall plate began [640] to pulverize, from the weight; and I had to drill holes through the wall plate, and bolt the wall plate in, so it would not fracture. It convinced me of one thing: that we were going to run into a condition, or we might run into a condition, whereby the wall plate would be too light. I changed the wall plate from 12 by 12 to 14 inches by 14 inches. The danger of the material running away from under the wall plate is apparent if the wall plate is not supported; and that is the reason for enlarging the wall plate.

This method that I have described was carried on and the material that was encountered was a broken material that I interpreted as sandstone. It would not stand without support. When I got a distance in, as I recall now, about between 150 feet and 200 feet from the portal, I ran into a laminated formation—that is another word,—being inexperi-

(Testimony of Lewis Michael Larson.)

enced in geology,—for chert. The laminations offered a little resistance, but, after I penetrated further in, they began to pulverize, and finally offered no resistance at all and contained a little water that tended to run in under, and had to be removed from the breastboard; and we had to be very careful, in advancing the spiling, to see no material or rock formed a cavity. In entering the posts, we had to be very careful in excavating down at a distance not to exceed 4 feet, the material under the wall plate board and the breastboard against the core, and the spiling and the outside wall of the tunnel, and then the post would be entered. Then it was excavated, with the power shovel, a distance of about 4 feet. The muck that comes from the upper drift is dropped down into the lower drift, where it then is picked up and hauled out and dumped where the power shovel can pick it up. There was a little difficulty in that, because of men working directly nearby, and we had to erect scaffolding for those men, to prevent any material falling off from that transportation medium [641] onto the men working below.

After running through possibly 20 feet of this laminated material, I ran into what I thought, and still believe, was a sandstone. It offered a little better resistance than the laminated material had, but it was anything but self-sustaining. It would not support itself, and I had to offer the same support to that that I did on the other material; but, as I

(Testimony of Lewis Michael Larson.)

advanced into that, it began to become less firm. I had perhaps penetrated it for 20 feet when I ran into some more of this laminated material in a less substantial form than the preceding; that was: it was more broken, and, as I recall it now, at around Station 114,—which would be 114 plus 00,— I think is the proper way to describe it—it was a completely pulverized mass.

Mr. Tinning: Q. Would you mind my interrupting you, Mr. Larson. You have given us a station, as 114; 114 plus 00. That was before you ran out of the 20 feet that you thought was offering some resistance and came into that broken material, was it?

A. I first ran into one section of this laminated material for about 20 feet. Then I ran into about 20 feet of the sandstone; and then I reentered this stuff I am speaking of, that was so badly pulverized.

Q. When you ran into that laminated material, was that about 40 feet towards the west portal from Station 114 plus 00?

A. Well, it would be about 60 feet, I should say, where I first entered it. Then I ran for 20 feet, and then the sandstone for 20 feet; then the pulverized material. I am giving you it approximately. The pulverized material of this second laminated section, where it began to run out and enter that sandstone again. In this case, it was also 20 feet—If you take 20 feet, 114 plus 00,—that would be 113 plus 80; subtract 20 feet from 113 plus 80, and

(Testimony of Lewis Michael Larson.)

you have 113 plus 60. That was the end of the first laminated section; and 20 feet from 113 plus 60, that would be about the first contact point of the laminated material. [642]

Mr. Marrin: Will you proceed, Mr. Larson? Would it help you in giving these stations to have this poster back?

A. It might. It will help in this, that I can illustrate to the Court what I mean.

Q. The witness is now referring to Plaintiff's Exhibit 42.

A. The cross section legend by the letter "B". The breastboarding, your Honor, to which I referred, is indicated by the cross pieces. There are stulls running against the core in the direction of the drive that are not in evidence here, and the spiling shown on the outside of the post.

Q. Did your estimate contemplate having to do that breastboarding and spiling in the wall plate section?

A. Not at all. In the wall plate section when you use the wall plate method, it is ground where you expect that when you drive your wall plating you can excavate with a power shovel, by using material for blasting, that is, dynamite, to break your rock and put up your posts under your wall plate. That is generally the thought in construction, and it was my thought in this instance. My thought in this instance was I could go in with these two wall plate drifts on each side, take the drifts immediately

(Testimony of Lewis Michael Larson.)

above them and let that material fall by gravity into the lower drift, and then the next drift above that let the material fall by gravity into the lower drift, and then the top drift, and let the rest of the material fall by gravity, but after I found the conditions that prevailed there it was imperative that I start the top drift and wheelbarrow that material out of the top drift and then drop it down into the lower drift. It was necessary to raise and lower the caps which necessitated the framing out in the yard of the closing segment that was between the top drift and the drift immediately above the wall plate drift; one end only could be framed and the other one cut to length to fit. [643]

Q. Will you proceed with your explanation of the character of the ground and the excavation method at the point where Mr. Tinning asked you that question?

A. About Station 114 plus 00, as I now recall it, I encountered a sandstone that offered a little better resistance than the previous sandstone, but it was broken and fractured. As I proceeded with the excavation it became more broken—I do not recall the station definitely where it needed side support, but I think it was about 30 feet, possibly 114 plus 30, that the pressure on the segments—I will describe that to your Honor so that it will be understood more clearly; the pressure on the segment at the meeting point——

(Testimony of Lewis Michael Larson.)

Q. The witness is referring to Plaintiff's Exhibit 42 and the type B section.

A. At the meeting point of the segment off from the wall plate and the segment immediately above it, the angle was very nearly a straight line, that is, it offered very little resistance; the radius that forms that curve is something over 27 feet long, if I recall, 27 feet 2 inches, which means a very flat curve, and when we tried putting timber up there we had very little resistance at that point. This weight that I have mentioned that came from the crevice on the north side of the north tunnel, and which weight I felt all the way through, and where I had so much trouble holding the ground when I was concreting continually on that left-hand side; it continued, as a matter of fact, with more or less severity until I reached the station, as I recall now, 115 plus 60 or thereabouts; the weight became so heavy at this point, which would be Station 114 plus 30, that I had to put some very heavy timbers from these two segments down to the wall plates on the opposite side of the tunnel in order to prevent collapse.

I forgot one thing, when we entered the excavation after [644] concreting I had a batch of posts, that was almost a solid mass of timber in that first 20 feet; the pressure was so heavy at that point that I had to carry timbers across from one wall plate to the other in order to prevent collapse. Now, the weight registered more at this particular point 114 plus 30, approximately; the weight regis-

(Testimony of Lewis Michael Larson.)

tered at the angle between the segment, which is the wall plate segment, to the segment immediately above it, and it was there that I had to support. As I advanced with these segments the material seemed to stiffen a little bit, the rocks became a little firmer, and I had advanced possibly another 60 feet, which would make the station about 114 plus 90, when I began to take courage from the stiffening of the rock, I placed a hurry-up order for the drill carrier, always looking for that self-supporting ground, and believing that we would find it; I thought here was a continuing stiffening of the ground for about 60 feet, and we were entering into this formation that the geologist had indicated might be found. I stopped all drift excavation to go into the economic open face method, which would allow me to shrink my excavation by at least a foot, so we save expense of concrete, save me timbering for protection of the men, re-using my timbers after I had taken them out over and over again until they were worn out; it was all an economic move. I penetrated that material for a distance of 12 feet and then proceeded cautiously, because I saw there was a softening, going on for another distance of about eight or ten feet, as I recall it, when suddenly a big block of material containing about 12 yards, 10 or 12 yards, dropped out from the roof. It showed that I could not carry on with a full face method. The drill carriage in the meantime had arrived, and I continued the erection of the drill

(Testimony of Lewis Michael Larson.)

carriage, thinking that that was possibly just a little fault line, and I would soon pass into the firm material. I was [645] not discouraged, but expected I would get to the firm material; it was necessary to go back to the wall plate method for the safety of the men and safety of the structure. I proceeded again to reopen my drift, and by that time two weeks had been lost. I should mention, too, that in the beginning of the excavation, after the concrete lining was put in, it takes two weeks at least to run your crews out and get them gathered so that they won't interfere with other following operations; whenever you change your operations you have to figure about two weeks loss, which was the result in this instance, by the time I got the crews all lined up again and properly faced the material, the pressure that I had felt on the left-hand side of the tunnel I now felt over the top, and it ran across the tunnel at possibly 45 degrees, or approximately that, taking somewhere between 60 and 80 feet in crossing, and the pressure then began to register at the same point between segment A and segment B, over the right-hand side of the tunnel.

Mr. Tinning: Q. Will you give us the station, approximately?

A. I think this is about Station 116; possibly it would be about the center of it.

Mr. Marrin: It is understood, Mr. Tinning, he is giving these from recollection, and they are approximate.

(Testimony of Lewis Michael Larson.)

A. Yes, from my recollection of four years back; it is not easy to recall an exact location. I had found, at least I concluded that my greatest danger lay beyond the contact point of A and B segments. To accomplish two purposes I transferred my wall plate up to that point; and when you have a long wall plate in and you have a number of sets carried onto that wall plate, you have an outward thrust from the mere formation of your arch on that wall plate; that had a tendency to stiffen that very weak point; it had another virtue, it assured me of cheap material in the core. [646] The fewer drifts the cheaper your material is, the better progress you can make under average conditions, the more money you can make and the more money you can save.

Q. When you say you transferred the wall plate to that point you were pointing to type C legend on plaintiff's Exhibit 42, and you pointed to the fact that you transferred the wall plate to a higher point?

A. Yes, from the top of the post to the top of the segment that had formerly rested on the wall plate. Now, the pressure became so heavy at that point that in spite of that cautiously moving the wall plate began to cave, and I had to put stulls across from the new position of the wall plate, from one wall plate to the other.

Q. Did you carry the original wall plate also in that?

(Testimony of Lewis Michael Larson.)

A. No, I did not. I then carried it as an independent set up to the wall plate, that is, I placed it upon the former post of the segment that had formerly rested on the wall plate, and the top of that segment was a support for the new wall plate. The work had not advanced very far until the timbers in this weakened portion began to come down pretty rapidly. I had to suspend operations in that place and send men back to retimbering; some of the timbers had gone down 12 inches into the concrete line. I began a complete retimbering operation and placed in an almost solid timbering over the arch, which I thought would be sufficient to hold it, but I could not hold it that way. It still threatened to break through the timber, so I had to erect from the wall plate to the top segment upon each side an A frame support underneath the wall plate. I had to take the stulls from one side of the segment to the other side to prevent collapse.

Q. Will you explain what you mean by an A frame? A. A A frame—

Q. Do you want to draw it on the board?

A. I think possibly it [647] would be a little clearer if it could be visualized than explained.

Q. Perhaps you can simply draw it in here, just a line to show the Court what you mean by an A frame.

A. Well, assuming this to be the wall plate on this side, and this to be the top segment, the A frame support requires the placing of another timber under the cap, here, and carrying a direct leg

(Testimony of Lewis Michael Larson.)

down to the wall plate from each side, which took the support inside of the concrete but it was the only thing that could be done to prevent collapse, and then the timbers that I talked about carried across, the stulls across, they were carried across about an elevation of 4 to 6 feet below the top segment. That describes it. I again proceeded with the excavation and I started a drift operation again. As I did so I ran into a more broken mass, much of the rock about the size of my hand, but it was firm and hard, but there was considerable water in it. Later on that spread from the wall plate drift up to the top drift and it appeared it was finally going to cover the whole tunnel. This was the condition of the tunnel when I left work on April 30th.

Q. You said the ground was firm and hard. Do you mean self-supporting?

A. No, it was very much the reverse. It was just a mass of loose rock, fractured, broken.

Q. Now, will you point out on Plaintiff's Exhibit 42 the point to which you were in charge of the excavation of the north tunnel?

A. I was in charge of the excavation in the north tunnel to the point indicated here by the legend "B", which was an average tunnel distance in of 530 feet.

Q. From the west portal?

A. From the west portal.

Q. That is at station approximately 115 plus 60?

A. Thereabouts, yes.

(Testimony of Lewis Michael Larson.)

Q. Now, Mr. Larson, I will ask you was any of the ground encountered by you in the north tunnel self-supporting?

A. No, except possibly 12 feet, the 12 feet that I referred to when I took courage and ordered [648] the drill carrier.

Q. And tried the full face method?

A. And tried the full face method.

Q. Will you describe the method of excavation and the ground condition encountered in the south tunnel during the period up to April 30, 1935?

A. Yes. The method shown on Exhibit 42 cross section marked "E" was the method that was taken up by Mr. Whitmire; I had started the top drift; he carried that on because there was a mud patch in there, and it was evident in the drift when I discontinued the drift in 92 feet that the mud was rising and that we would probably soon be out of it; consequently the top drift was put in there to control that mud patch, and as I recall it now it was carried for a distance of about 40 feet when the mud ran out. Mr. Whitmire then carried on with the one drift to the top of the plate, to the location of the wall plate on each side of the tunnel for a distance of about 42 feet as I recall it now; that would be about 112 plus 85, approximately.

Mr. Tinning: That was what, when you say one drift—was it on each side?

A. On each side of the tunnel, one that was advanced to the point where men could work without

(Testimony of Lewis Michael Larson.)

danger from the operations above. Mr. Whitmire began to take out the ring, that is the section between the wall plate and the top drift; he used a different method from the one that I used. He allowed that material to drop down into the lower drift, and he had a power unit that he termed a Bagley, it is a scraper that is propelled ahead by a double drum hoist, one block for the line to run through fastened at an advanced position; when one hoist is applied it pulls the scraper or dragline into the drift; when the other hoist is applied, that is, the power is applied to the hoist, it has the reverse action of pulling this scraper out with the material. This material then was hauled out to the toe of the core [649] where a power shovel picked it up and loaded it into cars. He found it advisable to change the method on account of the ground conditions. This little firmness that I encountered when I was in 92 feet, of course, had given us the indication and belief that we would find self-supporting ground at that point. We were disappointed.

Q. Mr. Larson, that Bagley drift started at 92 feet, and where did it end?

A. At about plus 82, but the Bagley method was continued for many hundreds of feet beyond that, or at station approximately 112 plus 82, Mr. Whitmire changed the method of operation as indicated by the legend F.

Mr. Marrin: On Plaintiff's Exhibit 42?

(Testimony of Lewis Michael Larson.)

A. On Plaintiff's Exhibit 42, yes. That method was pursued by him during the period of time that I remained in the tunnel, and observed the excavation, and it consisted of running a lower drift at sub-grade or approximately sub-grade elevation, on each side of the tunnel, followed by a drift immediately above that, also on each side of the tunnel, which material was dropped down into the lower drift and removed by this Bagley process that I have described. When the advance was sufficiently forward that he could put up the timber for the ring, that would be posts for the ring, he would begin on the ring, excavate it as one unit; that is, work both ways, drop the material down into this lower drift and continuing the removal by this Bagley. As this excavation of the ring was accomplished he left the core in for removal by power shovel after the ring had been carefully timbered; he used additional timbers; I used a seven-ring arch, he used a nine. That was about the departure of the method in regard to the support of the arch. When he had gone in possibly, as I recall it now, 400 feet, it might be more or less, he lost the lower drift; and he encountered a formation which appeared to be cherts. I defined it [650] for him as cherts. The material ran in with the water.

Mr. Tinning: What station?

A. I would estimate that at about probably 116.

Q. And upon which side?

A. On the lower drift on the left-hand side.

(Testimony of Lewis Michael Larson.)

Q. That would be the north drift?

A. That would be the north drift of the south tunnel; he carried a second drift over that, so that it would give him room to place the support against the side wall to prevent any further material running into the drift and when that was accomplished he resumed the excavation as heretofore on the lower drift, followed by the second drift, and continued to do that in that manner during the time when I was in the tunnel.

Mr. Marrin: Q. What was the character of the ground encountered by Mr. Whitmire during that period in the south tunnel?

A. My judgment was that it was a little firmer than the ground in the north tunnel, but it had more water.

Q. Was it self-supporting?

A. There was none self-supporting in the tunnel; there was no self-supporting ground in either tunnel during the period that I was there except the 12 feet that I mentioned in the north tunnel.

Q. To what point had Mr. Whitmire carried his excavation at the time you left the work on April 30?

A. He had carried it 618 feet of average tunnel. By that I mean taking the yardage of the several drifts and coring and ring, adding them together and dividing them by 35.61, which was the neat excavation for the tunnel, that gave him the distance 618 feet in and gave me the distance of 530 feet in.

(Testimony of Lewis Michael Larson.)

Mr. Wittschen: Q. Would you give us the station?

A. 618 added to 111 plus 53 and on the north tunnel 530 added to the [651] station 111 plus 42.

Mr. Marrin: Mr. Larson, I show you a photograph which is entitled "Inside of the tunnel West Portal May 1, 1935, Type B," and ask you if you can tell me what that represents?

A. That represents the material in the tunnel at the time I left the work.

Q. And the condition of the timbering?

A. And the condition of the timbering at that point.

Mr. Tinning: I suppose, to make the record clear, you are referring to the north tunnel?

A. Pardon me, it was the north tunnel.

Q. The tunnel of which you were tunnel superintendent? A. That is correct.

Mr. Marrin: I offer that in evidence.

(The photograph was marked "Plaintiff's Exhibit 43.")

[Set forth in the Book of Exhibits at page 279.]

Q. You said you left the work on April 30, 1935. Were you again employed by the plaintiff in connection with this work? A. I was.

Q. When were you employed?

A. On August 29 I was called in—

Q. August 29, 1935?

A. Yes, August 29, 1935 I was first called in to a conference and asked to make an examination of the tunnel.

(Testimony of Lewis Michael Larson.)

Q. What had occurred in the tunnel at that time?

A. The tunnel had caved in, the north tunnel.

Q. What were you employed to do?

A. At that particular time I was employed to make an investigation and report on the condition. At a later time, on the 16th of September, I believe—

Q. 1935?

A. 1935, I was asked to come in and recover the tunnel at that point and concrete it and put it back into safe condition.

Q. By "recover," you mean you were asked to remove the caved-in [652] material and concrete?

A. Yes, and leave it in safe condition.

Q. At about what point or what engineering station, if you can give it in the north tunnel, had the cave-in occurred?

A. It apparently had centered around this station 114 plus 0, where that running material and badly broken material had occurred.

Q. Will you just describe briefly the appearance of the cave-in when you first arrived on the work?

A. When I first arrived on the work the material had filled the tunnel to an estimated distance at the bottom of about 130 feet; the timber was completely down for a distance of 57 feet and was more or less in a point of collapse for a distance of probably ten feet more on each side of the caved material. The material, itself, was mostly the pul-

(Testimony of Lewis Michael Larson.)

verized material that I had thought to be cherts; on the east end of the cave, where some of this sandstone that I mentioned we had encountered was down; one large block containing a great many yards, I don't know how many, had depressed the segment on the south side of the tunnel, and it was such a large block, that when work proceeded on recovery we had to take off little points of it and crawl under it instead of removing it as a mass. [653]

(After Recess.)

Mr. Marrin: Q. Mr. Larson, you stated, this morning, that you had excavated the tunnel to a certain point at approximately Station 116 in the north tunnel. Did you want to correct that testimony?

A. Yes. I have checked up on the stationing—530 feet added to 111 plus 42, I think, makes 116 plus 22; that is the average spacing.

Q. Did you excavate about to the point on Exhibit 42, as shown by the end Section "C"?

A. Correct.

Q. I would like to draw your attention to Plaintiff's Exhibit 31, one of the models. Does that illustrate the system that was used by Mr. Whitmire in the south tunnel?

A. Yes; according to legend "F" on Exhibit 42.

Q. Mr. Larson, will you proceed to explain how you removed the caved-in material from the north tunnel?

(Testimony of Lewis Michael Larson.)

A. I will use this,—one of the cross-sections here on Exhibit 42,—to illustrate a condition similar to the one that I used. It is indicated by cross-section "I" on Exhibit 42. I will explain to his Honor that the bodies had been found at about the location of the lower drift on the right-hand side.

Q. You mean by "bodies," the men who were killed in the cave-in?

A. Correct, yes; and the rescue crews had excavated in to the point where the bodies could be recovered. The work had stopped there; and, when I took charge of the recovery work, I placed crews on both ends of the caved-in material in both drifts, both lined drifts.

Q. Will you explain to the Judge how you had access to both ends of the caved-in material?

A. There are adits, your Honor, that go from one tunnel to the other, as indicated by the line at a distance approximately in 680 feet, apparently, from the west portal of the north tunnel.

The Court: Q. What is the distance across?

A. Approximately [654] 99 feet between the walls of the two tunnels.

Mr. Marrin: Q. An adit is a small tunnel connecting the two larger tunnels, is it?

A. Yes. In this case, it was 5 by 7 feet, approximately. That had been driven through prior to the accident, which gave the men the opportunity who otherwise would have been trapped in the forward part of the excavation which had been car-

(Testimony of Lewis Michael Larson.)

ried on to about Station 123 plus 40,—that is, about the face of the north tunnel,—at the time of the cave-in—which was, as a matter of fact, around Station 114 plus 00; that gave the men a chance to come out through that adit and through the south tunnel, and reach safety, and also made it a point in which men could go in again and resume work without being obstructed by the caved material. It gave me the opportunity to bring in men to attack this material from the east end, and other men in from the west end. I excavated the two lower drifts, as indicated, first; and then followed with the two drifts immediately above, and then two drifts immediately above the second drifts, or the third drift above subgrade. I carried that to an elevation of about 3 feet above the wall plate line. I should state, at this time, that the timbers had caved in for a distance of 57 feet. The posts and the wall plates had not come in, but were beginning to. The material evidently had come in so rapidly from the top that, before the side walls could collapse, the material had filled the tunnel and given support to these unsupported side timbers, the posts and the wall plates. My purpose in excavating to that point was to bind the wall plates in position and to further the development work to give me something definite on which to carry on my work. After the drifts had all been excavated through, I erected forms similar to those used in the first concreting of the two tunnels,—wooden forms, covered with

(Testimony of Lewis Michael Larson.)

metal. I erected the side walls, first, and [655] put a key in them, for the concrete to about a foot above the wall plates.

Mr. Tinning: Q. How high would that be?

A. That would be approximately 20 feet—between 19 and 20 feet. There, the usual construction key was put in, for concreting the arch later on. While that concreting was being carried on, with part of the crew, I drove that top drift over the loose muck. I should state this, in advance: that the remaining timbers that had not collapsed but were at the point of collapse, were all supported by posts that were carried from those timbers down to this fill material that had fallen in the tunnel; this fill material was all the time compacting; as it was compacting, the timbers from above that were weakened were falling down. It was necessary, realizing I would have to find new support on this settling core, or material that was in the tunnel, to drive my top drift higher, carrying it probably 2 feet above the outer concrete line. That was all going fast. Sometimes, I held it; and sometimes, I failed to hold it. The settling continued, of course, as it transmitted the weight onto the timbers and the top segments; and, in this case, I increased that top segment from 12 by 12 inches to 14 by 14. I worked crews from the sides, driving that top drift. It was necessary, of course, in this instance, to drive spiling all the way over the top and on each side, because it was just a pulverized mass,—just like sand. When the two drifts were through, the minute the

(Testimony of Lewis Michael Larson.)

walls had been poured through the caved material, I began then working crews—First of all, I poured a ring of concrete from these walls adjacent to the timbers that were down, and giving support to the timbers that were at the point of collapse. That prevented the cave from spreading. It was also a safety to the men who would continue in the work; and, from this new concrete ring that was about 6 to 10 feet in length, the [656] new concrete arch resting on the side walls—that had a length with the tunnel—the length of the new arch. When that was completed, I started crews at the top drift, driving spiling downward. The cap that held those, normally, rested on one set of posts that were transmitted down to the core, and then, in turn, some foot blocks that were wide enough not to be crushed into this loose material. The other end of the cap was inserted into the concrete; this, of course, all above what we term the "pay line of concrete"; that is the 2 foot point above the inner edge of the lining. I established the distance of approximately 6 feet. My purpose in that was: the new material could be very heavy; it was just a broken mass above me of undetermined height; I have never checked the distance, but it was lying in sort of a crater, and it had collapsed in that condition; but, of course, being so very badly pulverized, it had no means of supporting itself in that position. Then, working on both sides of the cave, driving the spiling on the side adjacent to the material and up over

(Testimony of Lewis Michael Larson.)

the cap until I reached the concreted wall on each side; and I then stopped and put in my form segment for the concrete; put in the reinforcing steel, and poured concrete in on this new ring of about 6 feet in length, measured along the tunnel line, with operations alternating on the west side, then to the east side. As soon as it had been poured, I started crews excavating another 6 foot section driving spiling from the top, and repeated that operation until I had pinched off all the material, and everything was resting on the concrete.

The Court: Q. After you repeated that operation, was there a cavity left?

A. The cavity was partly filled, your Honor, with material that had got to the line,—the tunnel line, at the top, apparently. The cavity was about 15 to 18 feet deep. When material that is broken,—whether it swells, or whatever it does,—it [657] does not contract itself—and it is possible this cavity, later on, might be deeper; but that is as near as I could estimate this: about 15 to 18 feet from the normal elevation of the material.

Mr. Tinning: Q. Mr. Larson, I don't know if I am clear—You are referring to that at the surface of the ground above where the slide occurred in the tunnel,—some distance up, there was an actual crater on the surface?

A. That is the point I am trying to bring out.

Q. That was the point that was about 15 feet?

A. Yes. That was my estimate.

(Testimony of Lewis Michael Larson.)

Mr. Marrin: Q. There was no cavity left inside the tunnel—

A. No. That remained in a compacted condition. The material that was in there when it filled the tunnel had remained in a compacted condition.

Q. After you had completed the section, did you then remove the caved material?

A. Yes; we were set to remove the core.

Mr. Tinning: Q. Remove the core, did you say?

A. The new core of loosened material.

Mr. Marrin: Q. Were you required to leave the forms of concrete for some time before the core was removed?

A. As I recall it, the last pour that we made,—I mean, the pour that closed the aperture,—was about 5 days. I may be mistaken in a day or so.

Q. When did you commence this operation of removing the caved-in material?

A. On the 15th day of September, as I recall it; and completed it about—

Q. 1935?

A. 1935; and completed it about the 6th of December. That is my guess. I might state something, to clarify the situation a little bit: that the posts were removed from the caps that [658] I have mentioned, by putting in rails, carried the rails—what we termed "balled" them in; that is, two rails, with the flanges and balls nesting together, would be carrying from the cap down to the forms supporting the concrete.

(Testimony of Lewis Michael Larson.)

After the concrete lining was poured, we would burn those rails off, so there would be no projection below the inner finish of the concrete line, and leave a smooth surface. [659]

Q. Mr. Larson, did the fact that the timber could not be removed from the section of the tunnel which you excavated before the concrete lining was placed affect the cost? A. Yes, quite materially.

Q. In what way?

Mr. Wittschen: Objected to as immaterial, and particularly in view of the witness' testimony that in the first 720 feet he did not intend to remove the timbering, and has testified that his own plan originally contemplated leaving the timber in the first 724 feet of tunnel.

Mr. Marrin: I think he would be entitled to answer, your Honor, as to the effect on the cost of removing the timber. It will appear later that a great portion of this tunnel where he contemplated removing the timber he was not able to do so.

Mr. Wittschen: He quit and left the job before he ever got beyond the point where he intended to leave it in right from the start.

Mr. Marrin: He is qualified as an expert to answer the question.

The Court: I will allow it in subject to the motion to strike.

Mr. Wittschen: Exception.

A. It affected it in the material cost of the timber, first, in the framing cost, the transportation

(Testimony of Lewis Michael Larson.)

cost, and the erection cost. In my experience in tunnel construction I know of no case where timber in place is as cheap as concrete in place; consequently, where you had to put in timber it increases your cost; even if you had the lowest class of timber, it increases the cost over concrete which otherwise might have been used.

Mr. Marrin: Q. Would it also increase the size of the excavation required? [660]

Mr. Wittschen: The same objection.

The Court: The same ruling.

Mr. Wittschen: Exception.

A. Yes, it does increase it, because the timber has to be outside of the outer edge of your concrete.

Mr. Marrin: Q. During the time that you were employed by the plaintiff was the work delayed in any way by the action of the plaintiff?

A. Not that I know of, no.

Q. What is your opinion about that?

A. That it was not.

Q. That it was or was not?

A. There was no delay on account of the plaintiff.

Q. Mr. Larson, during the time that you were employed by the plaintiff did the company, or any of its officers, ever refuse to give you all of the equipment needed in connection with the work?

Mr. Wittschen: Objected to as immaterial, irrelevant, and incompetent, and self-serving.

(Testimony of Lewis Michael Larson.)

Mr. Marrin: If your Honor please, I want to show that Mr. Larson had full opportunity, full authority to get all the equipment and all of the men that he needed in prosecuting the work. There is going to be a question involved, if your Honor please, as to the time, it is going to be very material, and we are simply producing this testimony to show that we used every effort to complete this tunnel within the contract time.

Mr. Wittschen: May I observe on that, they took a contract to build a tunnel within a certain time and supply all of the labor and material, and presumably that was their responsibility, and whether he was refused equipment or not would not make any difference; if they could not get labor that would not bind the defendant.

Mr. Marrin: There is a provision that provides that if in [651] the judgment of the engineer the plaintiff was delayed for any cause beyond his control he is entitled to an extension of time, which judgment, in our opinion, must be exercised fairly and impartially in view of the circumstances.

The Court: I will let you make a record on it, as I have heretofore ruled. I will allow the testimony to go in subject to your motion to strike, and an exception.

Mr. Wittschen: Exception.

A. They did not. I had a call on any equipment that I might have use for.

(Testimony of Lewis Michael Larson.)

Mr. Marrin: Q. Were you allowed to employ all the labor you needed?

Mr. Wittschen: The same objection.

The Court: The same ruling.

Mr. Wittschen: Exception.

A. I was allowed to employ all of the labor, but much of it was not competent labor.

Mr. Wittschen: I ask that that go out. They chose the labor, that was their responsibility.

The Court: It goes out.

Mr. Marrin: Was the labor competent labor?

Mr. Wittschen: Objected to as immaterial.

The Court: Objection sustained.

Mr. Marrin: Q. Did the plaintiff direct you to expedite the work as much as possible?

Mr. Wittschen: Objected to as self-serving, and leading and suggestive.

The Court: Objection sustained.

Mr. Marrin: Note an exception.

Q. In your opinion, Mr. Larson, in excavating the portion of the [662] tunnel which you excavated did you employ the best construction methods under the circumstances?

Mr. Wittschen: Objected to as incompetent, irrelevant, and immaterial, and asking for the opinion of the witness upon a matter which is self-serving, as far as the plaintiff is concerned.

The Court: I will allow him to make a record on it. I will overrule the objection subject to a motion to strike out.

(Testimony of Lewis Michael Larson.)

Mr. Wittschen: Exception.

A. I did the best I knew how.

Mr. Marrin: I should like to introduce in evidence for illustrative purposes the poster on the easel which has no legend, but it is being introduced for the purpose of illustrating the lines and grades necessary in the construction of tunnels in this manner.

The Court: Let it be marked.

Mr. Marrin: I offer it.

(The poster was marked "Plaintiff's Exhibit 44.")

The Court: What does that diagram depict? Explain that in your own way.

Mr. Marrin: Explain what it shows.

A. That depicts first the grades and lines that are necessary for the proper progress of the excavation of the tunnel.

The Court: Q. Just indicate for the purpose of the record what that discloses.

Mr. Marrin: The witness is referring to Plaintiff's Exhibit No. 44.

Q. Will you explain, Mr. Larson, the lines and grades necessary to be used in the excavation of this tunnel?

Mr. Tinning: This diagram appears to be a diagram of a drift.

Mr. Marrin: This shows how a tunnel has to be constructed by the drift method.

(Testimony of Lewis Michael Larson.)

Mr. Tinning: You have some models that show, they are a large [663] size.

Mr. Marrin: We have a model showing the full face method we hoped to use, but the testimony in this case will show that the tunnel had to be excavated by the drift method because of the condition of the ground.

Mr. Tinning: There were drifts for driving ahead of the open face.

Mr. Marrin: In excavating a tunnel, where you have to use the drift system, as we will show and also prove through this witness, it is necessary to check the lines and grades in the drift at the forward portion of the drift.

Mr. Tinning: That is what I wanted to get a statement from you on, as to what you were proceeding on—this is a drift.

Mr. Marrin: Certainly, and that is where the lines are set.

Mr. Tinning: That is your contention, that that is where they should be set. You asked him as to the method of excavating a tunnel. This is one of the drifts in his tunnel. That is what the diagram is.

Mr. Marrin: Yes, that diagram is a diagram of a drift.

Mr. Tinning: That is what I wanted to make clear for the record.

A. This illustrates, your Honor—

(Testimony of Lewis Michael Larson.)

Mr. Marrin: The witness is referring to Plaintiff's Exhibit No. 44.

A. (Continuing)—just one operation of a drift. There are several drifts and in each instance something similar would be necessary for line and grade. If it is considered a drift down below the wall plate something similar would have to be used so as to give its location. It covers, in a general way, what is required in the location of a tunnel by the drift system. In [664] order to make it clear, the men who are working excavating forward to get the right elevation or the right line, it is necessary that they have established in the immediate vicinity of their work lines from which they can get the distance in or out, lines which will give them the proper direction, grades that will give them the necessary elevation, so they will not go too high or too low. This section illustrates its need and the manner in which we generally use them in tunnel work. Now, often times a little movement of ground, the shooting of ground, if it offers resistance, where dynamite is necessary, a little displacement may cause misalignment of the lines that give direction, and consequently it is provided, and it is generally true, that you receive three lines, three points, so that in case one does not check with the other two that you can try to determine an approximate compromise or try to determine with other points further back which one of the lines may have been thrown out, and in that way give the workmen a

(Testimony of Lewis Michael Larson.)

chance to go ahead and excavate in the direction in which they should excavate; consequently we had points on what we term a cap where we can swing a weight that we term a plumb-bob; this plumb-bob may be a piece of rock. The line support may be a piece of wire or it may be a piece of twine, or anything else that will suspend and allow the line to suspend in a vertical position. These points are entirely necessary for the progress of the work, as I stated. The grades for the same reason. These grades are generally placed at the request of the superintendent in some position where they will be protected and we can pick up from and get the right elevation for setting our foot blocks for our posts, whether it be on the right-hand side or the left-hand side. I say in a protected position, because in the operations of the work, shooting and one thing or another, you may destroy them [665] if they are not placed there; if they are placed at some point by some means where they cannot be disturbed unless something of a major nature happens, they can be driven in by some form of spike like they use on a railroad track, only there is a little spike driven in the side of the post. That elevation is indicated by the engineer at the request of the superintendent at a certain distance above the foot block; that means 2 feet, 3 feet, 4 feet, or whatever in the judgment of the superintendent is the proper elevation. From that distance measured down we determine the elevation of the

(Testimony of Lewis Michael Larson.)

foot block; the posts are generally cut to an established length, and if you place the grade at the right elevation your cut is going to be at the right elevation. From the suspended line you get the distance out you must go in order to get your timber line and tunnel in the right direction. That illustrates only one of the operations. If you have 13 drifts you have to have that operation in 13, possibly, unless you can suspend your line down to one of the lower drifts. But that is something that we have to have every day in order to keep checking that there has not been a shift in the line, something that has to be run as your progress goes ahead, it has to be known to the men who are working, to see what they are doing, and make no mistakes.

Q. Referring to Plaintiff's Exhibit 44 and the diagram on the right-hand side, this point here which I am pointing to from which the hand projects represents what?

A. This is the excavated face of the drift. Now, I am putting up a post first of all; we run over here and establish the grade for our foot block. From the line we establish the distance out for that foot block. Now, we have established the direction and the elevation and the distance out for the foot block, and we know how far from that foot block [666] we are going to place the next foot block in order to give us operating room. We establish the

(Testimony of Lewis Michael Larson.)

top of our post in the same way with a necessary distance. If you establish your top and bottom you have the inclination of your post or the plumb of the post, whatever is required in the different directions you establish all of the drilling factors, and you are starting off then with a positive elevation and positive line.

Q. During the time that you were employed by the plaintiff were those lines and grades stated on Plaintiff's Exhibit No. 44 established in each of the drifts which were driven before the excavation proceeded? A. Not by the force of—

Q. I am asking you that question, were they established? A. They were not.

Q. Listen to the question I asked you. Will you please read the question?

(Question repeated by the reporter.)

A. They were established.

Q. Who established them?

A. Engineers employed by the Six Companies, paid by the Six Companies.

Q. Did the District during that time establish any of these lines and grades?

A. No, not that I know of. I am positive they established none in the drift.

Q. By the District, I mean the defendant in this case, or its employees. A. No.

Q. Did the District, to your knowledge, establish any lines and grades in the tunnels?

A. Yes, they did.

(Testimony of Lewis Michael Larson.)

Q. Will you describe what they did?

A. After the excavation was advanced a certain distance, an indefinite distance, they would follow up, giving us the center line and elevation at that point. They were follow-up lines, they were not advance lines. [667]

Q. How far back were those lines usually from the core of the tunnel which was being excavated?

A. I will have to give an estimate of that. I should say approximately all the way from 100 to 300 feet.

Q. Would those be sufficient lines and grades for you to work to in constructing the tunnel?

A. Decidedly not. To work to they had to be where we were working, they had to be in a forward position, not in a backward position.

Q. Do you know, Mr. Larson, what is ordinarily referred to in the construction industry as contractors engineering? A. Yes, I do.

Q. What does that mean?

Mr. Wittschen: I object to that as immaterial, irrelevant, and incompetent, and asking the witness first to endeavor to interpret the contract, and, secondly, asking him to give a definition in general terms which is not binding upon the defendant.

Mr. Marrin: The object is this, there is a provision in the specifications which I think has been read before. It is subsection (s) under Section 6 on page 7, which is entitled "Lines and Grades." It says, "The contractor is to furnish free of charge

(Testimony of Lewis Michael Larson.)

all stakes necessary for marking and maintaining points and lines given by the District Engineer; and shall give the District Engineer such facilities and materials for giving said lines and points as he may require, and the District Engineer's marks must be carefully preserved. Sufficient points to line and grade will be set for the contractor to work to and no additional stakes will be set. Any such stakes or marks lost, damaged or obliterated shall be replaced at the expense of the contractor. The contractor shall do his own engineering and shall be responsible for the completion of the work to proper lines and grades in conformance with the stakes set by the District Engineer. The District Engineer shall be furnished facilities for the checking of lines, elevations, [668] grades and forms at all times during the progress of the work. The contractor shall, without charge to the District, provide openings for and suspend work that will in any way interfere with the surveys, at such times and for such periods as the District Engineer may deem necessary." Now, in order that Your Honor may understand the meaning of this, I will say that early in the performance of this contract the plaintiff demanded of the District Engineer, and which will be fully proved, and kept on demanding for months that the District Engineer set sufficient lines and grades in these drifts for the contractor to work to. The District Engineer took the position

(Testimony of Lewis Michael Larson.)

that this provision of the specifications which said that the contractor shall do his own engineering requires the contractor to do all that work. As we view it it was a condition precedent to the contractor's obligation to perform, which work should have been done by the District. Now, the term "contractors engineering" as used in the construction industry is of the nature of a technical expression and we want to produce witnesses to testify as to the usually accepted meaning of that phrase so that your Honor may have the benefit of knowing and deciding in this case what meaning it would have to a man familiar with the usages in the construction industry.

Mr. Wittschen: We do not object to this witness stating that the District did not do certain things. The term "contractors engineering" is not being used. It said that the contractor should do his own engineering. The question now is asked of this witness to interpret something that is not in the specifications, what is known by the term "contractors engineering". These specifications state that the contractor will do his own engineering and your Honor will ultimately have to construe what this means, but I do not [669] think that a witness called by one party has the right to define a term that is not in the specifications.

The Court: You may, if you limit it to the language of the specifications, develop from this expert any thought that you have in mind.

(Testimony of Lewis Michael Larson.)

Mr. Marrin: Q. Mr. Larson, I will show you the specifications and ask you to look at this part of Section 6, subdivision (s) on page 7, and I will ask you to read that and state to me what obligation the contractor had under that provision of the contract, in your opinion?

Mr. Wittschen: Objected to as immaterial, irrelevant and incompetent, and calling for the opinion and conclusion of the witness upon a matter which is not the subject of expert testimony, and seeking to have the witness do something which should be done by the Court.

Mr. Marrin: That is Plaintiff's Exhibit 3.

The Court: I will allow the testimony in subject to the motion to strike.

Mr. Wittschen: Exception.

Mr. Marrin: Q. Will you read it first and then tell us what it means?

A. "The contractor shall do his own engineering and shall be responsible for the completion of the work to proper lines and grades in conformance with the stakes set by the District Engineer." Is that the extent that you wish?

Q. Yes, just read that.

A. My understanding of contractors engineering is that if the contractor wishes to have some change in the plans, in the method of constructing the concrete or some other detail, that he must apply to the District Engineer for the District Engineer's Approval; to show what he has in mind, that he

(Testimony of Lewis Michael Larson.)

must do his own engineering so far as the location of the plant, give the right lines and grades for it, the indication [670] of the equipment that he is going to use in the prosecution of the work. That is my opinion of that clause.

Mr. Marrin: Q. Is it your opinion that under that clause the contractor has an obligation to set those lines and grades for the construction of the tunnels?

Mr. Wittschen: Objected to as leading and suggestive and having been asked and answered. The witness was asked to construe the clause and did so, and counsel now is suggesting something else to him.

The Court: Read the question.

(Question repeated by the reporter.)

Mr. Wittschen: And all of the other grounds.

The Court: He may answer subject to the objection.

Mr. Wittschen: Exception.

A. It is my opinion that the contractor would not be required to do any of the work; that is a part of the owner's work.

The Court: Under your construction of this clause, what was not done? What did the engineer fail to do?

A. The engineer failed to give us points to work to that were necessary for us to carry on our work properly.

(Testimony of Lewis Michael Larson.)

The Court: Briefly indicate that for the purpose of the record so I may have some understanding of it.

A. Referring to Exhibit No. 44, none of the points that are indicated in this exhibit were given by the owner and were all given by the contractor. My understanding of the contract would be that these lines and these grades were an obligation of the owner and not the contractor.

Q. Was he to build that frame? A. No.

Q. How could he give those lines without constructing it?

A. We put up the frame and then after the frame is put up he [671] comes and puts the lines and grades on the frame that we have constructed; he checks them in case of possible movement.

Q. Very well. What does that operation involve, briefly?

A. The operation involves the employment of an engineer with an assistant who will pick up from some back point, giving a line to the engineer who has the instrument for projecting that line and then after the engineer has picked up from this point in the rear, or at some other point that may be chosen by the engineer, who has surveyed the point he could get the line into the several drifts on the frame that we have erected. The same applies to the grade in that his assistant will have to pick up the grade from some well established and positive point and carry that into the several drifts.

(Testimony of Lewis Michael Larson.)

Mr. Marrin: Q. Mr. Larson, is this a drift which has already been constructed?

A. That has been constructed in its present form and everything is noted in that drift except the grade and the lines, and they are to be supplied.

The Court: It is clear to both sides, is it not, what I am trying to develop? I just want to follow it. That is the reason I asked the witness, I do not want to mislead either side.

Mr. Marrin: I thought your Honor was a little bit confused when you asked the witness if they required them to construct the framework. I wish to simply bring out that that drift is in without noting the lines and grades to proceed to.

The Court: Let me say this off the record.

(Discussion off the record.)

We will take a recess now until Tuesday morning at 10 a. m.

(An adjournment was here taken until Tuesday, April 19, 1938, at ten o'clock a. m.) [672]

Tuesday, April 19, 1938.

Mr. Marrin: May it please your Honor, we would like to put a witness on out of order; his testimony will be rather short and I understand the other side has no objection.

The Court: Very well.

ALFRED JOSEPH ORSELLI.

Called for the Plaintiff; Sworn.

Mr. Marrin: Q. What is your business, Mr. Orselli? A. Civil engineer.

Q. Are you a graduate engineer? A. I am.

Q. Of what university?

A. University of California, Berkeley.

Q. When did you graduate? A. In 1927.

Q. During the years 1933 and 1934, were you employed by the W. A. Bechtel Company.

A. I was.

Q. Will you state when you entered the employ of that company? A. November, 1933.

Q. For how long thereafter were you employed by the W. A. Bechtel Company?

A. Until June, 1934.

Q. Continuously? A. Continuously.

Q. During the time you were employed by the W. A. Bechtel Company did you have anything to do with making estimates for bidding upon the project of Joint Highway District No. 13?

A. I assisted Mr. Larson in the preparation of his estimates by securing material quotations and making extensions of his estimates.

Q. And in checking his estimates?

A. And in checking his estimates.

Q. I show you a document marked "Report and Proposal Tunnel Proper, Broadway Tunnel Project of Joint Highway District No. 13," which also has on the cover page, "Engineering Development De-

(Testimony of Alfred Joseph Orselli.)

partment [673] Bechtel Kaiser Company, Ltd., 155 Sansome street, San Francisco, California, and ask you to tell me what that is.

A. This document—

Mr. Tinning: Just state what it is, Mr. Orselli.

A. This document is a recast of Mr. Larson's original estimate in the form required, or the recast of Mr. Larson's estimate as handed to me in the form required by the Bechtel interests.

Mr. Marrin: Q. Is the information in there the same or different from that contained in Mr. Larson's estimate?

Mr. Tinning: Just a moment, we object to the question on the ground that it does not call for the best evidence, in that the original sheets and documents that were handed by Mr. Larson to Mr. Orselli are the best evidence.

Mr. Marrin: I might explain, Mr. Tinning, that we have here the original sheets which Mr. Larson prepared and they are in the form of pencil notations, and are not in particularly intelligible form to the Court, and it is not our purpose to introduce those in evidence, because we think they will simply incumber the record. However, they are here available for your examination and available for your use upon cross-examination. The purpose of this testimony, your Honor, is to show, and we offer to show through Mr. Orselli, that he took these pencil notations of Mr. Larson's and his estimates, and recast them in the form required by the W. A. Bechtel Company; that thereafter changes were made and that this recast was revised and it

(Testimony of Alfred Joseph Orselli.)

was upon this revised recast that the bid of Six Companies of California was made; in other words, the purpose of this is to trace through and show the connection between Larson's estimate and the bid which was submitted by the plaintiff in this case to the defendant in this case. We are not offering this particularly for the purpose of [674] proving the details of these figures, but to show that the final bid was substantially the same as Mr. Larson's estimates. That is the purpose of this testimony.

Mr. Tinning: We think that we are entitled, in tracing this through—I may not understand Mr. Marrin, but we think that we are entitled in the tracing of this matter through to have each of the documents that finally resulted in the bid; in other words, that we have Mr. Larson's sheets, that we have then what Mr. Orselli did with them, and then if they were recast I think logically that would be the next step.

Mr. Marrin: That is exactly what we propose to do.

Mr. Tinning: If I understand your statement you do not propose to introduce the original sheets of Mr. Larson.

The Court: Subject to your check if any attempt to digest is offered here; I take it that the original sheets are here and may be examined in detail. Do I follow you?

Mr. Marrin: That is correct, and they may introduce them in evidence if they desire.

(Testimony of Alfred Joseph Orselli.)

Mr. Tinning: In other words, we do not know what support there is to this because we have not examined the supporting documents and we are not in a position to stipulate. We do not question that you made some kind of a recast, but we do not care to stipulate to some document which is not supported by other documents.

Mr. Marrin: I am not asking you to stipulate to it or to the truth of any of the statements in it. I am merely asking this witness to identify and explain what it is, and then I propose to offer it in evidence.

The Court: As a legal matter I will sustain the objection, the objection is good. [675]

Mr. Marrin: Upon what ground?

The Court: The legal ground is good, namely, you have a digest here from some original sheets. They ask for the best evidence, and, under the rule, they are entitled to it. If they insist upon the objection the Court will sustain the objection.

Mr. Marrin: Do you insist on the objection?

Mr. Tinning: Yes. It is not to embarrass you, but we simply feel it is a necessary part of the case.

Mr. Marrin: It is not exactly a digest of it, your Honor, it is a recast in form.

The Court: You might offer the recast, but he is entitled to the original under the rule; he has called for the best evidence.

Mr. Marrin: In that case I presume we had

(Testimony of Alfred Joseph Orselli.)

better withdraw this witness temporarily and put Mr. Larson on.

The Court: Maybe after he examines this he will not object. I don't know what is contemplated.

Mr. Tinning: We do not know either. We have not seen it yet.

The Court: After you examine it probably you may get in accord on the presentation of it. I don't know.

Mr. Marrin: Q. Mr. Orselli, I show you here a file of pencil notations and figures and ask you if you can identify that and tell me what that is?

A. The file of pencil notes and papers herein are the original sheets prepared by Mr. Larson, passed to me for basing an estimate on the Broadway Tunnel proper.

Mr. Marrin: We now offer these in evidence.

Mr. Wittschen: We object to them on the ground that they are immaterial, irrelevant, and incompetent, cannot in any way change the original contract with the parties, and that the ultimate figures are those in the bid of the plaintiff in this case, and any preliminary figures tend to prove no issue.

[676]

Mr. Marrin: They are not offered for the purpose of varying the written contract in any respect. They are offered for the purpose of showing that Mr. Larson, as he has already testified, relied upon the geological reports, specifications and other matters in making this bid, and showing through this

(Testimony of Alfred Joseph Orselli.)

witness that the figures which Mr. Larson submitted were used by this plaintiff as the basis for the bid on this contract. There is no purpose to alter the contract or alter the amount of the bid, at all. It is simply a matter of connecting Mr. Larson's reliance with the bid which was made by this plaintiff.

Mr. Wittschen: The final figures submitted speak for themselves.

The Court: Is the matter submitted? I want both sides to protect the record.

Mr. Marrin: Yes.

The Court: The objection wi. be sustained.

Mr. Marrin: Note an exception, your Honor.

Mr. Alexander: We join in the exception, your Honor.

Mr. Marrin: I assume your Honor has ruled on this matter, but I would simply like to draw your attention to the fact that you did permit Mr. Larson to testify respecting this estimate, and this is simply confirmatory of the fact that he did make this estimate and turned it over to the plaintiff in this case.

The Court: That is his estimate and he turned it over to the witness on the stand?

Mr. Marrin: Yes.

The Court: Q. What was the purpose of doing that, if you know?

A. For the purpose of recasting it in the form required by the Bechtel interests.

Q. What was that purpose?

(Testimony of Alfred Joseph Orselli.)

A. For the intelligent presentation [677] of Mr. Larson's estimate in a form in which the Bechtel interests will understand it.

Q. And it was in preparation for making a bid on this work? A. Oh, yes.

The Court: You will have to stand on the bid. I will allow any reasonable latitude in reference to the thing that counsel suggests; whether they were misled by the geology or what not I am not prepared to say.

Mr. Marrin: Do I understand your Honor's ruling is that the plaintiff will not be permitted to connect up Mr. Larson's reliance with the plaintiff's bid in this case?

The Court: Mr. Larson is here and can testify as a witness and having his figures passed on to a third party, how will that corroborate it? There is no doubt about the bid figures, is there?

Mr. Tinning: No.

Mr. Marrin: But in ariving at the bid we had to go on someone's figures, and someone's prepared method. We are proposing to show that this plaintiff relied and acted upon Mr. Larson's figures as to costs and upon his proposed method as to procedure. Now, we propose to show that he turned it over to Mr. Orselli and he revised it so that it would fit in with the form of estimate that is ordinarily used by the W. A. Bechtel Company, that it was then turned over to the president and

(Testimony of Alfred Joseph Orselli.)

representative of the plaintiff in this form as prepared by Mr. Orselli, was slightly changed by them, and that their bid was based upon this estimate which was made by Mr. Larson. As we see it, we must show that connection, and this testimony is offered for the purpose of connecting up this bid with Mr. Larson's estimate.

The Court: I have in mind the record, and I am inclined to limit this record to the point where I am not misleading either one [678] side or the other; as to the question of law in the presentation of the case, I have some fixed state of mind; in fact, I do not want to preclude you from having a record in the event I am in error about the law in regard to this position. Now, the theory of presenting this evidence has to do with the geologist's report?

Mr. Marrin: It has to do with this. Mr. Larson already testified, as you will recall, to some extent that he relied upon the geological report and plans and specifications in making his estimates. Now, there is nothing, so far in this record to show that this plaintiff adopted and relied upon Mr. Larson's estimates in making its bid. The purpose of this testimony is to show Mr. Larson did prepare a bid, that he submitted it to the representative of this plaintiff, and the plaintiff used those figures and those methods as a basis for submitting its bid; in other words to show that its bid on this contract was made in reliance upon Mr. Larson's work. That is the purpose of this offer of testimony.

(Testimony of Alfred Joseph Orselli.)

The Court: I am prepared to give you a wide latitude and reasonable opportunity for presenting your theory of the case. I am in doubt as to what the proper method to follow is. I would not even suggest to you in presenting this case that you put a witness on the stand on the geological report or that some other evidence be offered and presented. I have in mind in discussing this matter that I have an open mind on all of these matters, and I want to give both sides the benefit of it without misleading them to their injury.

Mr. Marrin: Surely, your Honor, and here are the facts of the situation. Mr. Larson was the man who was employed to and did make the estimate, as is shown by his testimony; he then turned his information over to others who made the final compilation of the bid from his estimate. Now, if we must stop with Mr. Larson we are left suspended in mid air. [679]

The Court: I have that in mind.

Mr. Wittschen: Might I suggest that the final man who put in the bid—I will object to the evidence because I do not think it is material, but he can say that he relied on Larson's figures and he could get it without going through all the detail figures.

The Court: That is what I had in mind. Your theory of the case is whatever the facts may be he will have an opportunity to check them.

(Testimony of Alfred Joseph Orselli.)

Mr. Wittschen: Whoever put the bid in can tell you they relied on the report of Mr. Larson, and I will object to that as immaterial, but that will be the ultimate fact you are entitled to prove.

The Court: As a matter of law I agree with counsel at this time. I may be in error, but I want to give you a record.

Mr. Marrin: Surely. I feel very strongly that it is necessary to have the testimony to show what Mr. Larson's estimate was and to show that the plaintiff in this case relied upon it.

The Court: I think it might be helpful if you withdrew the witness on the stand and called your geological expert and then make an offer of all of this testimony at the proper time. I want to give both sides an opportunity to present their theories of the case and have a record in the event that I am mistaken about my views.

Mr. Marrin: Surely, your Honor. Before I withdraw this witness I would like to make an offer of proof for the record. We offer to prove through the witness on the stand that the estimate of the costs and methods of doing the work described in the contract between the plaintiff and the defendant, made by Mr. Larson, were delivered to this witness, who was then an employee of the W. A. Bechtel Company, and that this witness then made a recast [680] of Mr. Larson's estimates, simply for the purpose of changing the form; that this recast was then submitted to S. D. Bechtel, President of the Com-

(Testimony of Alfred Joseph Orselli.)

pany, at a conference between him and Mr. Hindmarsh——

The Court: Who was he?

A. He was an employee of W. A. Bechtel Company, and Mr. Fontaine, at which conference certain changes in Mr. Larson's estate as recast by Mr. Orselli were made. We offer to show the changes which were made. We further offer to show that this witness then made the changes which were discussed and agreed upon at that conference and that Mr. Larson's estimate, with those changes, was adopted as the basis of the bid of the plaintiff in this case for the contract which was entered into between the plaintiff and the defendant.

The Court: How would the defendant be bound by anything that might have happened there.

Mr. Marrin: It is not a question of binding the defendant, as I see it, your Honor, it is a question of showing the reliance of this plaintiff upon Mr. Larson's estimate. It is a question of fact, did the plaintiff, or did it not, rely upon the estimate which had been made by Mr. Larson? That is not a matter which in any way changes the contract or the specifications. We are making no attempt to do so. We are attempting to prove the fact of Mr. Larson's reliance upon the geological report and specifications in making the estimate, and, secondly, the reliance by plaintiff upon the work done by Mr. Larson. It is a matter of connecting it up. We offer to make that proof through this witness at this time.

(Testimony of Alfred Joseph Orselli.)

Mr. Wittschen: To which offer we make objection on all of the grounds heretofore made, and on the further ground that the ultimate figure in the bid and not the process of arriving at [681] the bid bound the parties.

Mr. Marrin: The ultimate figures in the bid do not disclose anything with reference to what that bid was based upon.

The Court: Is it conceded that this recast in the manner set forth had to do entirely with the Bechtel Company?

Mr. Marrin: No. I might state, in order that you may understand it, the initiation of the work of making this estimate was done by the W. A. Bechtel Company in association with five other associates at the time they started the work.

The Court: I understand that, but who of the defendants were in the meeting?

Mr. Marrin: None of the defendants were in the meeting. We are not attempting to bind them by any conversation or anything of that kind. We are simply trying to show what was done in making up this bid.

The Court: The Court will sustain the objection at this time.

Mr. Marrin: Note an exception.

Mr. Alexander: We join in the exception, your Honor.

Mr. Marrin: We will withdraw this witness. Mr. Larson, will you take the stand, please?

LEWIS MICHAEL LARSON,

Direct Examination (Resumed)

Mr. Marrin: Q. Mr. Larson, I show you here certain pencil notations and ask you if you will identify those. [682]

Mr. Marrin: Q. Will you state what those are, Mr. Larson?

A. With the exception of these sheets, this comprises the papers on which I recorded my estimate on the Broadway Low Level Tunnel.

Q. That is the estimate to which you have testified, in previous testimony, Mr. Larson?

A. It is.

Mr. Marrin: I offer that in evidence.

Mr. Wittschen: To which we will object, on the ground it is incompetent, irrelevant and immaterial; self-serving, as far as the plaintiff is concerned; and not binding on the defendant.

Mr. Marrin: For the sake of the record, I would like to make an offer of proof, your Honor, and state that we offer to prove, through this witness and by this evidence, the estimate by Mr. Larson made on the cost of doing this work and his reliance upon the statement in the plans and specifications and the geological report in making that estimate.

Mr. Wittschen: We add the further objection that that is all merged in the bid itself.

The Court: The objection will be sustained.

Mr. Marrin: Exception.

(Testimony of Lewis Michael Larson.)

Mr. Alexander: We join in the exception, your Honor.

Mr. Marrin: You may cross-examine.

Cross Examination

By Mr. Tinning:

Mr. Tinning: Q. Mr. Larson, were you ever employed by the W. A. Bechtel Company before February 25, 1934? A. I was not.

Q. Were you ever employed, prior to that time, by any of the remaining organizations which later formed Six Companies of California, the plaintiff in this action?

A. I had never been employed by any of the members that formed that group.

Q. How long, after February 25, 1934, were you continuously employed by either the W. A. Bechtel Company or the Six Companies [683] with which they were merged in the doing of the work on the Broadway Tunnel?

A. I was employed by the W. A. Bechtel Company until after the submission of the bids to the Joint Highway District for the Broadway Tunnels. I believe my transfer from the W. A. Bechtel Company to the Six Companies was about the 28th of May; that is my recollection.

Q. About that time, they knew and you knew they were low bidder on the job?

A. That is correct.

Q. How long were you engaged in making your estimate in this case for the bid?

(Testimony of Lewis Michael Larson.)

A. Possibly a total time of two months. That was interrupted by other estimates. There is a reason for my qualifying that statement.

Q. When you say "other estimates," you mean estimates on other jobs? A. That is correct.

Q. So that you started somewhere around the 1st of March—the 25th of February, I believe you gave us as the date, and continued two months, to about the 1st of May.

A. Until the —until probably the 28th of May, with the W. A. Bechtel Company.

Q. No, Mr. Larson. I was now directing your attention to the time you spent in the preparation of your estimate. I believe you stated you arrived in Oakland on the 27th of February, 1934, and started immediately working on your estimate; and it took you about two months to prepare the estimate,—to complete the estimate?

The Court: During that period, he did other work,—that is, estimated on other work.

The Witness: A. That is correct.

Mr. Tinning: Q. Therefore, you did not spend two months continuously in the preparation of this estimate?

A. May I enlarge on that a little bit?

Q. Would you mind answering "Yes" or "No," first?

A. Approximately [684] two months spent on this estimate.

(Testimony of Lewis Michael Larson.)

Q. How much time did you spend on making other estimates during that period?

A. Between February and May,—is that the intent of your question?

Q. Well, you say "two months approximately to prepare the estimate for the Six Companies"?

A. Yes.

Q. Was that a continuous employment, or did that preparation cover more than two months of the calendar? A. It was interrupted.

Q. How long was the interruption?

A. As I recall it now, there was an interruption of almost a month.

Q. During what period was that,—the interruption?

A. My recollection is, now, that it was about the 28th of March until somewhere around the 20th of April.

Q. What were you doing during that period?

A. I was estimating the Fort Peck Tunnel, Montana.

Q. Were you in Oakland or San Francisco while you were making the estimate of the Fort Peck Tunnel?

A. I went to Fort Peck, surveyed the site, and did some of the estimating, on the train, on my return; and in San Francisco, the major part of the estimating was made. This was followed by an estimate of the Figueroa Street Tunnel. The whole period of time, as I can recall it, was approximately a month that was spent on other work.

(Testimony of Lewis Michael Larson.)

Q. Then you came to Oakland about the 25th or 26th or 27th of February, 1934, and you left about the 20th of March, and then went East to the Fort Peck Tunnel, and then came back to San Francisco and worked on the estimate for the Fort Peck Tunnel, and then went to Los Angeles to estimate the Figueroa Tunnel? A. That is correct.

Q. Was that for the W. A. Bechtel Company?

A. Under the same employment. [685]

Q. Under the same employment?

A. That is correct.

Q. When you completed your work on these other two estimates, you then directed your attention again to the Broadway Low Level Tunnel estimate? A. I did.

Q. When did you conclude your work on the Broadway Low Level Tunnel estimate?

A. Shortly before the bid was entered; possibly a week; that would be some time about the 15th of May, is my recollection.

Q. You testified, last week, that you prepared various parts of your tunnel bid, or tunnel estimate, on sheets of paper which you delivered to Mr. Orselli and other employees of the W. A. Bechtel Company. Were those all delivered at one time, or were they delivered as you finished your work on each sheet?

A. As I finished my work on each sheet.

Q. Were any of those sheets delivered by you to anyone at the time you left this work, about the 20th of March, and took up the Fort Peck Tunnel estimate?

(Testimony of Lewis Michael Larson.)

A. They were all delivered——

Q. Mr. Larson, the question is: Were any delivered by you to anyone prior to March 20th, or whatever date it was that you left and went on the Fort Peck estimate? A. Yes.

Q. Some had been delivered before that time?

A. They had.

Q. Were other sheets prepared by you for this estimate on the Broadway Tunnel some time around the 20th of April?

A. It is difficult for me to give you a "Yes" or "No" reply to that, for the reason I can only recall from memory that I had substantially finished the estimate on the Broadway Tunnel,—that is, I had given a rough total; and then, from those sheets delivered to me, I had completed a finished total, or a more studied answer to the different problems.

Q. That finished total that you refer to: was that something you did before you went away, about March 20th?

A. No. I arrived [686] only at a relatively close result of what the total would be.

Q. Mr. Larson, I think that is quite—I am trying to make this plain. I am asking if that more finished total, to which you just referred, was prepared before March 20th or afterwards, when you came back from the other work.

A. After March 20th.

Q. So that, during the period from March 20th until April 20th, when you were away, these sheets

(Testimony of Lewis Michael Larson.)

were all given to Mr. Orselli or some other employee of Mr. Bechtel's Company, during that interruption when you were away from the work?

A. To the best of my knowledge, they were.

Q. During that time, as I understand it from you, more finished estimates—the material quantities, were secured,—that is, the cost of cement and other things that went into the work; they were added in to your estimate; is that correct?

A. Progressively, as those items came in, yes.

Q. Well, you were not there during the period those items were coming in, though?

A. A good part of the time I was.

Q. What was the condition of your estimate on March 20th? You said it was partly finished; you had a rough total. Were there any material quantities in your estimate when you left on March 20th?

A. The estimate, in regard to weight—I figured the weight, for example, of the flues; and I take off different quantities, and I estimate the number of pounds.

I know about the prices various manufacturers charge for various articles.

Q. You determine that from your experience, and you attribute, from that judgment which you exercise, prices that those various materials will cost that go in to the estimate?

A. Yes, that is true; and, from that, I arrived at what we term a rough total. [687]

Q. When you arrived at that rough total, that was wholly on your own work and the sheets which

(Testimony of Lewis Michael Larson.)

you finished were wholly prepared by you?

A. Entirely so.

Q. Before you left, about March 20th, was anything added to those sheets or to the estimate, by any person other than yourself?

A. Not to my knowledge.

Q. Then, when you came back a month later, you found the data,—the quotations on the various materials that were required for the performance of the work, such as cement, timber and iron, and many other things that went into the work?

A. I found some of them, but not all.

Q. Not completed at that time?

A. No; not completed.

Q. In other words, you still had to make this final rough estimate which you prepared; you had to get further material prices?

A. That is correct.

Q. How long after you came back, did you complete the assembling of that data?

A. I think it was completed about the 15th of May, so far as my direct contact with it was concerned, although there may have been certain material prices that had not been received.

Q. When you concluded with the estimate on May 15th, there were still certain items for the cost of various materials that must be received and incorporated in the final figure?

A. Yes. They were receiving different quotations from different people, and some were slow in making their answers.

(Testimony of Lewis Michael Larson.)

Q. The last time you had to do with the estimate was about May 15th?

A. The last time when I entered anything into my estimate was about May 15th.

Q. When was the meeting with Mr. Hindmarsh and Mr. Bechtel; what was the date of that?

A. I am not prepared to answer that, because [688] my memory is defective; but I think it was about that same time, as near as I can recall.

Q. Mr. Larson, did I understand you to say that your memory was defective?

A. In telling you on certain dates, yes, extending back four years.

Q. After you undertook your work for Six Companies, about the 28th of May, 1934, how long did you continue in the employ of the Company, continuously?

A. Until the 30th of April, 1935.

Q. Did you resume employment for the plaintiff after that date,—April 30th, 1935?

A. I did.

Q. When, Mr. Larson?

A. As I recall it, it was about the 15th of September.

Q. How long did your employment last at that time?

A. My recollection is that it was until the 1st of December, 1935.

Q. You came on the job, did you not, the day following the slide that occurred on the night or the evening of August 28, 1935? A. I did.

(Testimony of Lewis Michael Larson.)

Q. You say, now, you think you were employed about the 15th of September. Weren't you employed immediately following the slide?

A. I was employed by the legal department.

Q. You were employed by the legal department?

A. Yes.

Q. That is the legal department of the plaintiff Six Companies?

A. As I understand it.

Q. How long did you remain in the employ of that Company,—the legal department?

A. Only two or three or four days, as I recall it now. It was not long; it was merely to make a survey of the conditions.

Q. That was August 29th?

A. August 29th.

Q. And the employment lasted three or four days; and then did that employment cease?

A. It did. [689]

Q. For the Six Companies altogether, at that time?

A. I have no recollection, after that time, of having any direct association. I was in conference with Mr. Hindmarsh during that time, however.

Q. Then, on the 15th of September, you went back with the Six Companies, engineering department, under a regular employment?

A. That is correct.

Q. And you were engaged in what I think you call "recovering the Tunnel"; that is, taking out the slide?

(Testimony of Lewis Michael Larson.)

A. Yes; that is the portion that had caved in.

Q. Yes, the portion that had caved in. From September 15th until about December 1st, your time was given to that work,—the recovering of the Tunnel, the removal of the material that had caved into the Tunnel; and did you have anything to do with the placing of the concrete, the retimbering in the portion of the Tunnel where the cave-in had occurred?

A. I did whatever was necessary in that portion, including the lining of that section of the Tunnel.

Q. So that, in recovering the Tunnel,—to make it fully clear,—you, afterwards, had charge of removing the caved in material, removal of the debris, and the timbering of a section of the Tunnel that had been impaired by the cave-in, the restoration of the timbering, the construction of the forms, and the pouring of the concrete in the forms?

A. That is correct.

Q. And that required from about the time you started on the 15th of September? There had been some work prior to the 15th of September, with respect to the removal of the bodies of the men who were killed in that accident? A. Yes.

Q. But, beyond that, the work was very much the same on the 15th of September; the condition of the work to be done was very much the same as it had been immediately following the accident?

A. I believe it was. [690]

Q. When you finished your work about the 1st of December, 1935, for the Six Companies, you had

(Testimony of Lewis Michael Larson.)

completed all of the work that was necessary to construct the main concrete arch in the portion of the tunnel that had been affected by the slide?

A. Everything except a little finishing of the lining of what we term "pointing up."

Q. Would you tell us what that is,—"pointing up"?

A. In carrying the weight of the tunnel down to the core, I had substituted rails, and taken out the timbers; those rails, later on, were burned off, back of the inner face of the lining; the pointing up means a covering over of the exposed rail. That was not quite completed.

Q. In other words, you used iron rails, or steel rails, as stulls? A. That is the point.

Q. Through the wooden forms which were installed in this section of the tunnel that was affected by the cave-in? A. Yes.

Q. You covered those holes with cement?

A. That is correct.

Q. After the 1st of December, 1935, when were you again employed by the Six Companies of California?

A. I have forgotten the exact date; possibly other people could supply that better than myself.

Q. Well, you have done pretty well so far. Let's have a little memory exercise.

A. I think it was in October of 1937.

Q. October, 1937. That would be last October?

A. Last October; that is my recollection.

(Testimony of Lewis Michael Larson.)

Q. Were you employed by the engineering or the legal department of the Six Companies last October?

A. By the legal department.

Q. During the short employment you had with the legal department in 1935, what did you do?

A. I was doing a little mining work for myself.

Q. You did not understand my question, Mr. Larson. I asked you not to state the type of employment you were following during your work [691] for the legal department; but what the actual work was that you did.

A. May I have that question read?

(Pending question read by the reporter.)

The Witness: A. Does this cover the period in October——

Mr. Tinning: Q. From the 29th of August, for the three or four days you stated you worked for the legal department.

A. To look at and report the conditions, as I found them in the Tunnel, and outside of the Tunnel, that would affect the work in the Tunnel, and safety of the construction.

Q. By that, you mean you inspected the timbering in the Tunnel, as it stood at that date; the condition that it was in; the excavation in and around the timber; the strain or stresses that might show in the timbering; and, during those four or five days, did you make any measurements of the portion of the timbering that may have intruded in that area required by the concrete?

(Testimony of Lewis Michael Larson.)

A. Not during that period.

Q. In other words, your report was a general report, based upon your knowledge as an experienced tunnel man, as to the conditions you found in the Tunnel immediately following that cave-in?

A. That was the objective.

Q. Did you make a written report on that, Mr. Larson? A. I did not.

Q. To whom did you talk?

A. I talked to Mr. Tom Price. I think I talked to Mr. DeLancey Smith, and to Mr. Hank Lawlor. I believe I talked to nobody else—not that I can recall.

Q. You made no written report of any kind at that time? A. No; just a verbal report.

Q. Did you ever make any written report on that observation?

A. I made notes on that observation that are used for making my verbal report. [692]

Q. Did those notes include references of your observation as to the condition of the timber in the Tunnel? A. I think they did.

Q. Did they also record the places that—or the sections within the tunnel, at which concrete had been poured?

A. I don't think so. I don't think I took the station numbers of that, because that was obvious.

Q. Were there any notes in there showing how long it had been from the time that the concrete lining had been last poured in the tunnel up to the date of that?

(Testimony of Lewis Michael Larson.)

A. No; because I was not familiar with that phase of it, myself. Some pouring had been done while I was absent.

Q. Well, are you prepared to say, now, approximately how much pouring had been done while you were absent?

A. It would have to be an estimate, only. It would not be absolute.

Q. Well, what, in your opinion, was the amount of concrete lining that had been placed after you left on April 30th?

A. I think, about 80 feet in the north tunnel, from the point where I had lined the first 110 feet; in the south tunnel, possibly two or three hundred feet; that is all an estimate,—just a rough estimate.

Q. Your idea is, now, there had been two or three hundred feet of concrete poured in the south tunnel after you left the work on April 30th and before you returned to it on August 29th?

A. That is my recollection now; I am not sure as to the accuracy of that recollection.

Q. Well, it is your best recollection?

A. Yes.

Q. And in the north tunnel,—the tunnel which you had been in charge of, driving,—that there had been about 80 feet of lining poured?

A. Yes. I am more definite on that, because I know where I had been pouring; that was why my memory is better on it. [693]

Q. That was the tunnel where the slide occurred?

A. That is.

(Testimony of Lewis Michael Larson.)

Q. After you returned to the employment of the legal department of the Six Companies, in October, what has your occupation been?

A. To assist in taking from the Six Companies' records such information as is necessary to form an accurate conclusion of the rate of excavations, the amount of concrete poured, and the number of days' delay; therefore, helping to set up for the attorneys such information as may be necessary and useful for them to have.

Q. Where were you employed after you left the Six Companies of California, the plaintiff in this action, on December 1, 1935, at the time that you finished recovering the caved-in tunnel?

A. Now, getting back to mining, I was working for myself.

The Court: We will take a recess.

(Recess) [694]

(After recess:)

Mr. Tinning: Q. Mr. Larson, you said you left the employ of the Six Companies in the fall of 1935, in December. Did you have any other employment in connection with the tunnel by anyone prior to your going back to the legal department of the Six Companies in October, 1937?

A. Not that I recall; I am sure I had not.

Q. Did you prepare any estimates for any contractor who either bid or considered bidding on the reletting of the work after the Six Companies quit?

A. I did.

(Testimony of Lewis Michael Larson.)

Q. How many estimates did you prepare for contractors who were bidding on the work?

A. I prepared two that were used.

Q. How many that were not used?

A. One.

Q. For whom was the estimate that was not used prepared?

A. I did not have any definite connection at the time. I made the estimate, as is often the case, being unemployed.

Q. Whom did you make it for?

A. Myself.

Q. You made it for yourself? A. Yes.

Q. At what time did you make that estimate?

A. Immediately after the District first called for bids, that date I am not sure of now; you can probably supply that.

Q. That was September, 1936, September 11?

A. Yes.

Q. Did you give the estimate that you made in September, 1936, to anyone? A. I did not.

Q. Did you communicate it to anyone at that time? A. I did not.

Q. How long did it take you to prepare that bid thereafter?

A. I think about a month, as I recall it now.

Q. About a month? A. Yes.

Q. So that for about a month previous to the time, the date on which bids were called for the completion of the Broadway Low Level [695] Tun-

(Testimony of Lewis Michael Larson.)

nel you occupied yourself without compensation by anyone in the preparation of the bid for the completion of the work? A. I did.

Q. Have you that bid or that estimate?

A. I have only a summary of it.

Q. Where were you working when you made the estimate, where was your office?

A. In the Sequoia Hotel here in the City.

Q. What was your purpose in making an estimate of that kind, Mr. Larson? Did you have in mind that you might find some contractor who would pay you for the estimate, someone who might be considering a bid?

A. I felt reasonably sure that I could form some sort of an association.

Q. So that this was not a gratuitous month spent by you, just for curiosity, but you thought you were doing something for which you might be compensated if you found a contractor who wanted it?

A. Yes, directly or indirectly.

Q. That is, by employment, you mean directly or paying you directly for the work that you had done? A. That is correct.

Q. Did you offer that to anyone?

A. I did not.

Q. Did you contact anyone or discuss the fact that you had made an estimate with anyone prior to the time bids were to be received under the District call in 1936?

A. I think I mentioned it to Mr. George Pollock, though I am not sure of that.

(Testimony of Lewis Michael Larson.)

Q. In that estimate that you prepared at that time, prior to the first date on which bids were called in 1936 by the District, did you prepare an estimate of anything other than the work in the tunnel?

A. Yes, I did.

Q. What did the bid for this work call for?

A. My recollection is the bid called for everything that was left uncompleted by the Six Companies.

Q. In other words, the first call for bids, and my memory is cor- [696] rect, that date was September 11, was for the entire job?

A. Yes, uncompleted work.

Q. That date was September 11, 1936, my memory is correct on that? A. Very well.

Q. You prepared then in your estimate the cost of the outside work, that is, what remained to be done, of the highway structures from Keith Avenue and Broadway, some two and a half miles up to the mouth of the west portal of the tunnel, and the remainder of the highway to be done on the east portal in Contra Costa County, the completion of the ventilating buildings at both the east and west portals, and those matters that went to the completed project from the point where it had been left by the Six Companies on June 13, 1936? A. Yes.

Q. What did you use as a basis of your estimate for the completion of the ventilating buildings?

A. I called on the people who had formerly had the contract with the Six Companies to get a quota-

(Testimony of Lewis Michael Larson.)

tion from them; they were prepared to give it to me, but I learned at that time that there would be no bid submitted by any contractor, and consequently when they offered it to me I asked them to hold it in abeyance, I would not need it.

Q. Where did you learn that there would not be any bids by any contractor?

A. I think it was here in the city.

Q. You mean through gossip, that there would be no bids?

A. What we term the "grapevine."

Q. What was the information that you had there would be no bid from any contractor?

A. That the call for bids was too general, not specific enough.

Q. And the result showed your information was correct, there was no bid received on it?

A. I understand there was no bid on it.

Q. And thereafter bids were called again for the 19th of October, [697] I believe the date was, and the work was segregated into driving the tunnel and seven other schedules of outside work, the finishing of the tunnel, the completion of the ventilating building, the installation of the mechanical and electrical and ventilating equipment in those buildings, and into various units of work. You knew that, didn't you, when you worked on your estimate? A. Yes.

Q. You said that the grapevine told you that no bids would be received in the September, 1936 call

(Testimony of Lewis Michael Larson.)

because the call for bids was too general. Was there any difference in the call for bids in October except that the work was broken up into the eight schedules?

A. I think there was, just what the differences were I could not enumerate, but the contractors accepted it as more specific, and I think it is more specific.

Q. There was the same identical specification, was there not?

A. The general specifications I think was the same.

Q. And the tunnel specifications were the same?

A. I believe the chief difference laid in the fact that you paid the contractor in the second call for bids on so much per sack for grouting; I believe it was more specific as to what should be done in the way of finishing. That is as I recall it now.

Q. I think you are probably correct in that; in other words, what you are referring to now as being more specific was in the first call for bids it called for completing the project in that every portion of the tunnel had some work done upon it, and there was no portion of the tunnel that was completed?

A. I believe that was stated in the call for bids.

Q. That was true, was it not, when you made estimates on it?

(Testimony of Lewis Michael Larson.)

A. I was in no position to deny it. I assumed it to be correct.

Q. You went out and looked at the tunnel, didn't you, when you [698] were making the estimate?

A. Yes, but I did not study it in the same detail that an engineer would have studied it who was not in touch with all of the details.

Q. When you made this estimate prior to September 11, 1936, during the course of the preparation, did you go out to the site of the work and go over the tunnel?

A. You mean for the period after September 11—I am a little confused.

Q. I am only using the date of call for bids September 11, the date for which bids were called the first time, and the work was called for under one general contract to complete, I am asking you when you prepared this estimate that you said was never used if you went out to the job and went over it and observed the state of completion of the work?

A. I undoubtedly did; it is my custom always to do that.

Q. Do you have any independent recollection of whether or not you went on the job?

A. I know that I did but I cannot tell you the date nor the circumstances.

Q. It was before you completed the work on this estimate? A. Correct.

(Testimony of Lewis Michael Larson.)

Q. When you visited the project did you observe whether or not the drift from the full excacated face had been driven in from the west portal, had been completed through to the east end of the tunnel?

A. My recollection is there was one drift that was not, and three that were.

Q. In other words, the most northerly drift in the north tunnel was not completely driven through?

A. It was not completely driven through.

Q. And in the same tunnel, the north tunnel, the wall plate drift had been completely driven through from the west excavated face to the east portal on the south side of the north tunnel?

A. Yes, it had been.

Q. That was on the south side of the north tunnel? A. Yes. [699]

Q. In the south tunnel the drifts had driven, the wall plate drifts had driven completely through the tunnel in to the east portal?

A. Yes, you could go from the west end of the tunnel through the drifts, in either drift to the east portal.

Q. So that at that time the ground to be encountered in each of the tunnels had been opened by a drift or drifts all the way through the mountain? A. Yes.

Q. All of the material in the mountain could be observed from those drifts and the nature of the ground?

(Testimony of Lewis Michael Larson.)

A. The material—I think it should be qualified —not all the material in the mountain, but the material.

Q. All the material in the mountain through which these drifts passed?

A. In that immediate vicinity of the drift, yes.

Q. You prepared two other bids in 1936. Let me withdraw that. You prepared two other estimates for bids on the completion in 1936. When was the first of the bids which you say were used by other contractors prepared by you?

A. Immediately prior to the offer of a bid for the completion of the tunnel. I don't remember the date.

Q. Well, for this purpose I think my memory is right. We will assume it was October 19th, I think that is the correct date. I am not sure, Mr. Larson, but I thought I understood you to say that the two bids that were used were prepared—the two estimates which you prepared were used on the second bidding; is that correct?

A. No, I did not intend it that way. The first estimate was the one used by the Six Companies of California, the first bid. The second estimate was not used by anyone. The third estimate was used by another contractor.

Q. Then you did not understand me when you made that statement. I was pointing to another period of time. I am only referring to [700] the

(Testimony of Lewis Michael Larson.)

estimate made by you after you left the Six Companies in December, 1935.

A. Yes. I made only two after that.

Q. You only prepared two estimates after you left, then, in December, 1935?

A. That is my recollection, yes.

Q. Is there any question about your recollection?

A. None at all.

Q. That is, apparently that you prepared two bids, one of them you never used, because you found no one to use it, and the second one was prepared after your first one, and was used by another contractor? A. That is the case.

Q. Who was he?

A. George Pollock Company.

Q. George Pollock Company was the contractor who was the low bidder on the completion of the driving of the tunnel? A. Correct.

Q. And the contractor who completed the work?

A. That is true.

Q. When was that bid prepared?

A. It was prepared immediately prior to the letting of the bid. I cannot recall the date when I began the estimate or when it was completed.

Q. How long did you spend preparing the estimate? A. Ten days.

Q. At that time did you go out to the tunnel again? A. I did.

Q. How many times did you visit the tunnel in the preparation of that bid? A. Once.

(Testimony of Lewis Michael Larson.)

Q. Did you take any measurements of the work to be done?

A. Yes. I took a measurement in this respect: I took the distance stated in the call for bids. I took a rough check on the materials on the ground.

Q. Did you at that time complete an estimate in the same way that you prepared an estimate for Six Companies in 1934?

A. I did not transmit my papers to anyone to check extensions or to get me material quotations. I got those things myself.

Q. To whom did you deliver that bid?

A. To George Pollock, as I recall it; either to George Pollock or to his associate, Mr. Clifford. [701] I am not sure about that. I believe, though, it was Mr. Pollock.

Q. Where did you do the physical work of preparing this estimate during the ten days you worked on it?

A. In my apartment in this city.

Q. Did you keep any copy of that estimate?

A. I did.

Q. Have you a copy in your possession somewhere now?

A. I have a summary in my possession.

Q. Well, you also have a summary of the first bid that you prepared for the completion?

A. Yes, I have.

Q. Did you destroy your work sheet?

(Testimony of Lewis Michael Larson.)

A. Yes. I had no occasion to keep the work sheet.

Q. For your second estimate, which you prepared for Mr. Pollock, were you paid?

A. I was.

Q. Were you employed by him at the commencement of that, the preparation of that bid, or did you begin it as you had the previous one?

A. I commenced it as I had the previous one.

Q. And then you told them you were doing this work and offered your services in preparing the estimate?

A. I did not come that way. I had an offer from different contractors for my estimate, and I accepted the offer that Mr. Pollock had made to me.

Q. What was your reason for leaving Six Companies on April 30, 1935?

A. That would have to be answered by other people. I do not know.

Q. Were you discharged?

A. I ask again that you ask that information from other people.

Q. Well, I am asking you, Mr. Larson, whatever the reason was.

A. There was no reason stated, except that they wished to put the tunnel under one management, both tunnels under one management.

Q. And they told you your services were no longer required after that?

(Testimony of Lewis Michael Larson.)

A. They told me Mr. Whitmire would remain with them, continue with them, and that was, to me, an evidence that my services would not be required.

Q. Mr. Larson, when you were testifying the other day in regard to [702] your experience in tunnel construction in the Coast Range I believe you said that your first experience in the San Francisco Bay Region was in connection with the Bay Shore development of the Southern Pacific Company between 1905 and 1911; is that correct?

A. That is what I stated, yes.

Q. That involved the driving of the Bay Shore tunnels near the San Francisco Bay, from San Francisco down the Peninsula, the present line of the Southern Pacific Company.

A. Yes, one of those tunnels.

Q. One of those tunnels. Which tunnel was it that you had experience with?

A. The one known as Tunnel No. 4.

Q. How many tunnels are there in that development?

A. There are five on the operating line and one tunnel, No. 2, is duplicated; six tunnels in but only five used for operating purposes.

Q. Tunnel No. 5 was your tunnel?

A. No. 4.

Q. Tunnel No. 4? A. Yes.

Q. Which tunnel is that as you leave San Francisco?

(Testimony of Lewis Michael Larson.)

A. Tunnel No. 4 is just as you enter what is known as the Bay Shore Yard.

The Court: The first tunnel, the second tunnel, the third tunnel, or which?

A. It is the fourth tunnel from San Francisco.

Mr. Tinning: Q. The fourth tunnel from San Francisco?

A. Yes, the fourth tunnel from San Francisco.

Q. How long a tunnel is that?

A. My recollection is that it is about 4500 feet.

Q. Through what kind of material is it driven?

A. Through some serpentine and, I think, shale. That is merely my definition, I am not a geologist and I wouldn't say the definition is correct.

Q. Well, serpentine and shale formed the majority of the material [703] through which the tunnel was driven? A. As I recall it.

Q. Is that self-supporting material?

A. No, it is not.

Q. Did you have to timber that tunnel as it was driven? A. I did for portions of it.

Q. Was it driven by the full face operation?

A. No, it was not.

Q. Were there any drills, jumbos, or drifters used in that tunnel?

A. No. In those days we did not have anything but what they termed "double jacking," "single jacking," that is, hand work.

Q. In what capacity were you employed on that work? A. I was the general foreman.

(Testimony of Lewis Michael Larson.)

Q. Who was your superintendent?

A. Mr. Dow.

Q. Was that the first tunnel work that you ever did in the San Francisco Bay Region?

A. It was.

Q. You stated you were employed on that work, the Bay Shore work, from 1905 to 1911?

A. I was.

Q. I think you also stated you were not on the tunnel all of that time, you were in some yard as general foreman.

A. When the tunnel was completed.

Q. How long did it take to drive that 4500-foot tunnel?

A. I think about a year and a half with the driving from both ends. I am not sure of that, I have not any data on it.

Q. How big was the section, what were the dimensions, width and height?

A. I think 26 feet 5 inches high at the center, and about 27 feet wide. I am speaking of the concreted section. That is as I recall it.

Q. How thick was the concrete?

A. Approximately 3 feet. The concrete was an arch lined, brick arch, or a spring line.

Q. Then the walls were practically perpendicular, were they?

A. They were perpendicular.

Q. They were perpendicular? A. Yes.

[704]

(Testimony of Lewis Michael Larson.)

Q. They ran up about how high?

A. I think it was 10 feet 6 inches.

Q. The rest of the arch, you stated, was brick?

A. The total of the arch was masonry work.

Q. You stated something about total.

A. The total arch.

Q. The total arch.

A. We speak of the spring line up to a certain point.

Q. That was a perpendicular concrete wall and then the circular portion with the arch laid in the brick? A. Yes.

Q. Was the core removed before the arch was placed? A. No. [705]

Q. In other words, you stulled in the core of that tunnel as it was drilled?

A. That is true. I might tell you more of it, to make it a little clearer, if I am permitted.

Q. Yes.

A. We had this earthquake, that we might have celebrated yesterday, during the period of that work; and after the earthquake, it seemed very heavy pressure came on the tunnel. It had been registered during the period when we were shut down; and immediately following the earthquake, the minute we began to work the ground, the timbers began to take terrific pressure, and we had to have the core to give support on that account; otherwise, it might have stood without support.

(Testimony of Lewis Michael Larson.)

Q. Well, there was a considerable period, then, after you got some of your excavating done, your timbers in, when you were delayed in construction due to the interruption of the earthquake, and pressure came on those timbers during that period?

A. I think the result of the shake caused it, and may have been immediate but it did not register until we began to move the timbers.

Q. How long was it after the earthquake before you resumed work in the tunnel?

A. My recollection was about 10 days.

Q. It was not a very long period? A. No.

Q. When was the heavy pressure, that you referred to, registered; how long after?

A. Immediately after we resumed.

Q. In 10 days?

A. Yes. We began taking the timber supports out that were resting on the core, in order to lay in the brick and masonry. As soon as that operation began, they began to show signs of weight.

Q. How long, or how far, had the tunnel been driven when the earthquake came over the horizon? A. I think the lower drift—we used the drift system—I think the lower drift was in about six or eight hundred feet; that is my recollection; and the core had been [706] removed possibly three or four hundred feet.

Q. When the core was removed in this Bayshore Tunnel No. 4, was the brick arch in at the time you removed the core? A. Yes.

Q. In other words, you put your permanent lining in before you removed the core? A. Yes.

(Testimony of Lewis Michael Larson.)

Q. Prior to the earthquake, when you were removing the timber, putting in your masonry arch, brick arch, up to that time, you supported the arch by stulls against the core? A. We did; yes.

Q. You did the same thing after the earthquake?

A. Yes.

Q. So, the only result of the earthquake, in so far as the driving of that tunnel was concerned, is that for a time you had heavy pressures following the earthquake? A. That is true.

Q. More difficulty than you had before?

A. Yes.

Q. But the method used in driving the tunnel was the same? A. It was the same.

Q. You took out the timbers, and you carried your masonry arch around before the timbers were taken out? A. Yes.

Q. You had to stull against this timbered arch, as you put it in? A. We did do so.

Q. Did you take all the timbers out of that Bayshore Tunnel?

A. I think we did. I am not entirely clear on that.

Q. That was not self-supporting ground; but you took all the timbers out?

A. That was possible to do that, by the method we pursued, yes.

Q. And you did?

A. Yes. Let me clarify that: To my recollection, we did.

Q. You were there, Mr. Larson?

(Testimony of Lewis Michael Larson.)

A. Yes, I was there.

Q. You are giving us your best recollection?

A. Yes.

Q. Now, apparently after you left the Southern Pacific Company in 1911, at the conclusion of your work on the Bayshore Cut, you were [707] not engaged in the vicinity of San Francisco for five or six years; your work was in other places?

A. That is true.

Q. And apparently, out of California?

A. Yes, out of the State.

Q. You then returned to San Francisco in 1918, and you were employed by the Foundation Company of New York near Colma?

A. At Tacoma; Tacoma, Washington.

Q. Oh, Tacoma, Washington? A. Yes.

Q. My notes are not very clear on that. Then you were not around San Francisco in 1918?

A. No; I was not.

Q. The next time, according to my notes, you were back in San Francisco, or in the vicinity of San Francisco, was in 1923, when you had some work for the Spring Valley Water Company, in the vicinity of Niles Canyon? A. In Niles, yes.

Q. That continued from 1911 to 1923, a period of 12 years, which meant that you were not around San Francisco? A. That is correct.

Q. That is, engaged in tunnel work?

A. Engaging in tunnel work, is correct.

(Testimony of Lewis Michael Larson.)

Q. During that period from 1911 to 1923, did you keep in touch with the general development of tunnel construction in the San Francisco Bay region?

A. I did. This is my home, and consequently, I was interested in whatever might be doing.

Q. I suppose you read the engineering literature that comes out,—the various journals—for instance, the Western Construction News and others that I might call professional journals that have to do with construction work in this vicinity?

A. I do, when they are available, when I have the opportunity.

Q. Well, were you in touch with any of, or did you know about, the construction of other tunnels in that period between 1911 and 1923?

A. I visited the Twin Peaks Tunnel during the period of the opening of that work. [708]

Q. What year was that?

A. That was 1915.

Q. Did you make any observations of the driving of the Stockton Street Tunnel in San Francisco, which commenced, as I recall, in 1913?

A. No; I did not. I was then up in Oregon.

Q. Did you make any observations of the driving of the Fort Mason Tunnel in 1914?

A. No. I was out of the state at that time.

Q. Did you know about that? A. I did.

(Testimony of Lewis Michael Larson.)

Q. Did you make any observations of the driving of the Richmond Vehicular Tunnel?

A. I did not.

Q. Did you know anything about that?

A. No; I know nothing of that.

Q. Now, you started in 1923 with the Spring Valley Water Company; and what were you doing for that company?

A. I was superintendent for them, putting that aqueduct from Niles Canyon, just before the San Francisco Water Department acquired the Spring Valley Water Company.

Q. Did the aqueduct you refer to require any tunnel work? A. No.

Q. Just open cuts?

A. That was all open cut.

Q. And covered? A. Yes.

Q. That work was between Niles and what point? A. Sunol; between Niles and Sunol.

Q. It was the aqueduct that connected the water gate at Sunol with the lines of the San Francisco?

A. It was the replacement of the wooden aqueduct, that was there, by a concrete aqueduct.

Q. In other words, in your work there, did you observe the tunnels in Niles Canyon?

A. I did.

Q. Are any of those tunnels in self-sustaining ground?

A. My judgment is that they are not.

(Testimony of Lewis Michael Larson.)

Q. Did you observe whether or not they were timbered?

A. They are timbered; or were timbered, at that time. [709]

Q. In your judgment, they were not built on self-sustaining ground?

A. I assume that from the fact they were timbered.

Q. Then, as I understand it, your tunnel operations were resumed with the construction by Twohy Brothers of the Hollywood Tunnel in Los Angeles?

A. Yes.

Q. You were there for about two years?

A. Yes.

Q. Some time in 1925 was that work done?

A. I think it was in 1924 and '25.

Q. How long a tunnel is the Hollywood tunnel?

A. I think it is 4325 feet.

Q. What were the dimensions of the tunnel,—the width overall, or inside, the finished lining, and the height?

A. Inside the finished lining, it is 25 feet between walls; and I think about 23 feet high at the center.

Q. Was it lined? A. It was.

Q. With what material? A. Concrete.

Q. Were the timbers removed?

A. They were.

(Testimony of Lewis Michael Larson.)

Q. Was that tunnel driven by a full face driving operation? A. It was not.

Q. Was it driven in self-supporting ground?

A. It was not.

Q. It was driven by a drift method, was it not?

A. Yes.

Q. There were considerable difficulties encountered in driving?

A. We did have difficulties, yes.

Q. Against pressures? A. Yes.

Q. Use breast boarding in places?

A. I don't recall we used any breast boarding.

Q. Did you drive any spiling?

A. No; we did not drive spiling.

Q. Did you advance spiling by taps of sledge hammers? A. Yes.

Q. When did you finish that Hollywood Tunnel?

A. My recollection is it was in July, 1925. That is only a guess. [710]

Q. Following that, you prepared an estimate for a tunnel in the vicinity of San Francisco, did you not? A. Yes.

Q. What tunnel was that?

A. Then known as the Duboce Tunnel; I think now known as the Sunset Tunnel.

Q. Is the ground in the Duboce Tunnel self-supporting? A. Some of it.

Q. You found that out afterwards?

A. Yes, afterwards.

(Testimony of Lewis Michael Larson.)

Q. In preparing your bid, did you assume that the ground would be self-supporting?

A. My memory is not clear on that.

Q. What was the size,—the dimensions,—of the Sunset Tunnel?

A. I think it was about the same size and dimensions as the Hollywood Tunnel.

Q. About 25 feet in width, and about how high?

A. About 22 or 23 feet high, I think.

Q. Was the Sunset Tunnel lined throughout?

A. I believe it was.

Q. Do you know whether the timbers were removed?

A. Yes. In fact, I know some of them were not.

Q. Following your work with Twohy Brothers, in preparing an estimate on the Sunset Tunnel, you prepared an estimate for Twohy Brothers on the Claremont Tunnel, did you not? A. I did.

Q. Then you were later employed as a superintendent of construction on the Claremont Tunnel?

A. I was.

Q. How long was your occupation there at the Claremont Tunnel?

A. I believe it was about June, 1926 until November or December, 1929.

Q. In other words, slightly over three years?

A. Yes.

Q. That tunnel was what size?

A. The excavated size was 12 by 12. The line between was 9 foot horseshoe.

(Testimony of Lewis Michael Larson.)

Q. There was an invert at the bottom.

A. Yes.

Q. And a concrete pipeline of about 9 feet, approximately? A. It was 9 feet. [711]

Q. Was it completely round?

A. No. It was a horseshoe.

Q. How wide was it? A. 9 feet.

Q. How high? A. 9 feet.

Q. So you had an invert at the bottom and a horseshoe at the top? A. That is true.

Q. The excavation of that tunnel was 12 by 12? A. Yes.

Q. How long was the tunnel?

A. 18,004 feet.

Q. It was a water tunnel which was constructed by Greer and Meade, your employers, under a contract with the Eastbay Municipal Utility District, as a part of its system leading from Pardee Dam, into the City of Oakland? A. Yes.

Q. Leading through the Coast Range?

A. Yes.

Q. Leading through the same hills, same mountains, as the Low Level Broadway Tunnel was?

A. Yes.

Q. Following this, you prepared a bid on the Figueroa Tunnels in Los Angeles? A. Yes.

Q. What was the size of those tunnels?

A. My recollection is they are about 46; between 46 and 50 feet wide, inside the lined sections, and somewhere about 30 feet high at the arch.

(Testimony of Lewis Michael Larson.)

Q. How long were those tunnels, approximately?

A. I think they would average about 400 feet; some were longer, and some were shorter.

Q. In preparing your estimate, did you have a knowledge of the materials through which the tunnels were driven?

A. I had such knowledge as I gained from my own observation.

Q. Did you conclude, before you completed your estimate, the materials through which those tunnels were driven were self-supporting?

A. No; I did not, on account of the size of them.

Q. On account of the size of them?

A. Yes.

Q. In other words, the materials through which they were driven were not self-supporting for tunnels of the size that were built [712] to those specifications—It was true that steel support was used to hold up the material while the lining was being put in?

A. That was the design of the——

Q. That was done, was it not?

A. That was, yes.

Q. Following your estimate on those tunnels, you prepared an estimate for a sewer tunnel in San Francisco. For whom was that estimate?

A. Mr. Meade,—W. S. Meade.

Q. The same man you worked for on the Claremont Tunnel? A. Yes.

(Testimony of Lewis Michael Larson.)

Q. What was the name of the tunnel?

A. I don't recall the name—It is out here in the vicinity of the Bernal Cut.

Q. How long was it?

A. Oh, I think about three-quarters—between half and three-quarters of a mile.

Q. What was the size of it?

A. I think about 6 feet on the inside. That is rather a faint memory.

Q. Was the material through which this tunnel was to be driven, in your opinion self-supporting?

A. We had information that on this end we would run into water and sand; there were some borings that gave us that information. The other portion of the tunnel—my recollection is not clear as to what the formation might be,—the conclusion I arrived at.

Q. You don't recall now whether you concluded there was any part of this tunnel that was to be built, that you assumed was to be built, through self-supporting material?

A. I don't recall that now; not clearly enough to testify to it.

Q. You then prepared an estimate a little bit out of the San Francisco Bay region, but in Northern California,—the Newcastle Tunnel,—which is a portion of the road from Sacramento to Reno?

A. Yes.

(Testimony of Lewis Michael Larson.)

Q. Was that tunnel built in self-supporting material?

A. I thought it would be when I estimated it, excepting at the two portals. [713]

Q. What was it, actually?

A. The information I have is after the tunnel—the drift penetrated the tunnel a certain distance, and they found very hard granite.

Q. Quite a different material than anything found here in the San Francisco Bay region?

A. The formation there is different.

Q. That is the Sierra—the foothills of the Sierras? A. Yes.

Q. And a few miles east of Rocklin, where the granite, the ripraps for the Southern Pacific Line, is taken?

A. Yes; they are on this side.

Q. In other words, it is in the granite area?

A. Yes.

Q. They wouldn't be found around here?

A. Not to my knowledge.

The Court: We will take a recess until two o'clock.

(Thereupon, an adjournment was taken until two o'clock, p. m., this date.) [714]

(Testimony of Lewis Michael Larson.)

Afternoon Session

Two O'clock

LEWIS MICHAEL LARSON,

Cross Examination (Resumed)

Mr. Tinning: Q. Mr. Larson, following completion of your estimate for Mr. Meade on the Newcastle Tunnel I understand that you prepared an estimate for a bid on the Wawona Tunnel, which I understand is a tunnel on the southerly road leading out of Yosemite Valley?

A. That it right.

The Court: Is that one the granite tunnel?

A. Yes.

Mr. Tinning: That was a tunnel in which the material was self-supporting, was it not?

A. Yes, I think it was with very little exception.

Q. You so considered it in preparing your estimate for a bid?

A. I did, except that portion in which there was a valley that ran down close to the roof of the tunnel, where I thought some support might be needed.

Q. During construction?

A. During construction, yes.

Q. That is in the granite of the Sierras?

A. Yes.

Q. Following that you made an estimate for a bid for a C. P. R. tunnel in Vancouver?

A. Yes.

Q. What was the tunnel?

(Testimony of Lewis Michael Larson.)

A. It was a railroad tunnel that connected two yards of the C. P. R.

Q. Do you know the name of it?

A. I don't know the name of it.

Q. How long was it, approximately?

A. I think about three-quarters of a mile.

Q. What size?

A. It was a single track tunnel which made it about 17 feet in width on the ground and about 20 feet high.

Q. Was that tunnel lined with concrete lining?

A. It was contemplated to be lined, and I think it was.

Q. What kind of material was that tunnel driven through? [715]

A. I have not any definite knowledge of it, except the survey I personally made of other tunnels in that vicinity.

Q. What did you find from your survey?

A. Laminated material where the laminations were lying in horizontal layers instead of vertical layers, or nearly vertical.

Q. In preparing your estimate for that bid did you assume that the tunnel would require timber supports during its construction?

A. I have forgotten now whether we would have followed directly with lining. I know we had to put in some rails in the concrete. If the rails were considered as support during the construction of course I would not figure on any timber, and I do

(Testimony of Lewis Michael Larson.)

not definitely remember, but I believe when I figured I figured it was a tunnel to be supported by timbers. That is my recollection now.

Q. Following your work in connection with the tunnel at Vancouver, you prepared an estimate for Lindgren & Swinerton for a tunnel at Boulder Dam? A. Yes.

Q. In preparing this estimate for the cost of construction of those tunnels did you assume that the ground would require support during construction? A. 10 per cent of it.

Q. 10 per cent of it? A. Yes.

Q. Did you plan in that tunnel to operate on a full face driving method? A. I did.

Q. And those tunnels were constructed through material which required little or no timber support? A. That is my understanding.

Q. You never saw them during the construction? A. I did not.

Q. Where were the tunnels which you worked on for Merritt, Chapman and Scott near Ventura?

A. Between Ventura and Maricopa.

Q. On what route were they?

A. On the route known as the Ventura-Maricopa Highway, which would be a connecting line [716] between, as I understand it, the Valley Route and the Coast Route.

Q. Between the Coast Route and the Valley Route? A. Yes.

(Testimony of Lewis Michael Larson.)

Q. What was the length of those tunnels?

A. I think the three of them totaled under 1500 feet. I have forgotten the definite length.

Q. What was the size of the tunnels, the dimensions?

A. Standard highway tunnel, which would be approximately 30 feet in width and about 25 or 26 feet in height.

Q. Were those tunnels lined with a concrete lining?

A. Only the portal section, and one part of the tunnel known as Tunnel No. 2, that was in a broken formation, that was lined during the period I was there, and then I am told that they lined all three tunnels completely.

Q. Was each tunnel timbered during construction?

A. No, that is, two of them were not, one was.

Q. Will you give us from the west toward the east the portions of the tunnels that you refer to? You said a portion of the tunnels were lined immediately following the construction.

A Tunnel No. 1, that is the one nearest to Ventura, near the portal section of the tunnel, my recollection is about 10 feet, from 5 to 10 feet of the tunnel; Tunnel No. 2, the next one, about 30 per cent of the tunnel from the west end, and the two portals, with the eastern portal having about five feet of lining. Tunnel No. 3, there were two por-

(Testimony of Lewis Michael Larson.)

tals, the one farthest from Ventura there was approximately 50 feet of the lining near the portal and the east end of the tunnel.

Q. Was timber placed in any portion of the tunnel where there was no concrete lining?

A. No.

Q. What type of material were these tunnels driven through?

A. The first tunnel, No. 1, I don't know the name of the rock, but it was so near to a rock that would not stand as it was pos- [717] sible to without collapse, it was pretty well broken material, and Tunnel No. 2, after we passed through the laminated section for about 35 or 40 per cent of the distance, I think it was 30 per cent, we ran into what was termed an agglomerate, which I have been told is different from a conglomerate in that there is a clay cementing material instead of a sand cementing material. In the third tunnel the rock was considerably firmer. Whether it was granite or not I am not prepared to say.

Q. I think I understood you to say that the third tunnel was where you had lining.

A. The second tunnel.

Q. How far from Ventura is the most westerly of these tunnels, approximately?

A. Between 15 and 20 miles, probably 20 miles.

Q. How far is it from the most westerly tunnel to the most easterly tunnel?

(Testimony of Lewis Michael Larson.)

A. A distance of one additional mile, approximately.

Q. All three tunnels were within a space of a mile on the highway? A. Yes.

Q. Following your work for Merritt, Chapman & Scott near Ventura you prepared an estimate for Lindgren & Swinerton to bid on the outlet tunnel for the San Gabriel Dam No. 1?

A. Yes.

Q. What was the size of that tunnel?

A. That was 30 feet inside the lined section.

Q. Was that a water tunnel with an invert in it?

A. Yes, it was a circular tunnel completely lined.

Q. Was timber used in the construction of the tunnel, do you know?

A. Not a great amount of it.

Q. What type of material was it driven through?

A. It was a rock similar to the one that I represented as being in the No. 1 tunnel of the Maricopa tunnels where it was a question of whether it should have been timbered or whether it was dangerous without timber. [718]

Q. Following this work on the San Gabriel Tunnel you prepared an estimate for Lindgren & Swinerton for work on the Hetch Hetchy Tunnel?

A. Yes.

Q. And the portion of the Hetch Hetchy tunnels which you testified were those lying east of Niles and south of Livermore, through the Coast Range, were they not? A. Yes.

(Testimony of Lewis Michael Larson.)

Q. How many miles of that tunnel did you consider in your estimate, approximately?

A. I have forgotten the miles, but there is a man here that could answer it.

Q. I just want an approximation.

A. I think approximately in the vicinity of 6 miles.

Q. What was the size of that tunnel?

A. 15 feet, between 15 feet excavations, as I recall it.

Q. In preparing your estimate did you assume that you would require timber?

A. Through the major portion of it, yes, it would definitely require timber.

Q. That tunnel was lined with concrete lining?

A. It was.

Q. With an invert?

A. Yes, that was also a circular tunnel.

Q. At the time that you prepared your estimate of the Broadway Low Level Tunnel for the Six Companies in 1934, were you acquainted with the troubles and difficulties that had been encountered in the Hetch Hetchy tunnels? A. I was.

Q. You knew at that time, Mr. Larson, that due to the difficulties there encountered the contractor had been required to keep his concrete up close to the face of his excavation?

A. I knew that he had concluded it was necessary.

(Testimony of Lewis Michael Larson.)

Q. Following your estimate on the Hetch Hetchy tunnels you prepared an estimate for the Yerba Buena tunnel on Goat Island on part of the San Francisco Bay Bridge? A. I did.

Q. In preparing that estimate what did you assume with respect [719] to the ground you would encounter?

A. I thought we would have to do a little timbering there, but the plan of progress had something to do with the answer there, the plan being to drive the two side walls and then concrete that—the plan and specifications also called for steel beams to be placed—

Q. Steel beams?

A. Steel beams. I contemplated placing them as I took out the ring and work from those for a support for my concreting.

Q. In other words, in the method that you adopted in preparing your estimate you were going to leave the core in until after the permanent lining was installed in the tunnel? A. I was.

Q. What was the size of the tunnel?

A. I think it was 58 feet in width—that is my recollection of it.

Q. How high?

A. I should judge, my recollection is it was about 40 feet high; that is only approximate.

Q. Was this ground through which the tunnel was constructed self-supporting?

A. In certain localities I understand that it was.

(Testimony of Lewis Michael Larson.)

Q. When you prepared your estimate what did you consider you would encounter?

A. I thought we might find some broken ground in the side walls, pouring concrete in the side walls, and giving me the use of the steel beams for the arch would not necessitate the use of very much timber; furthermore, the grouting was to be done on the arch so as to make the ground from the arch practically self-supporting on filling in voids and bonding together the rock that might be disassociated.

Q. That was something that would be done during the construction and when the job was done you would have a solid grouting?

A. My recollection is that the grouting would be done in advance of excavation.

Q. In preparing your estimate did you assume that steel would be [720] placed by the owner or furnished by the owner for that tunnel?

A. No, I do not recall that it was; it was a bid item, that is my recollection now.

Q. As a matter of fact, in the construction of that tunnel steel beams were used from portal to portal, were they not?

A. That is my recollection.

Q. And after they were installed the concrete lining was placed in the tunnel in the space between the ring and the core was excavated? A. Yes.

Q. You did not consider that ground self-sustaining, did you?

(Testimony of Lewis Michael Larson.)

A. The way it was to be handled, yes, I would. In the first place there was grouting to be done to bond the material at the arch; the side walls I did not consider as self-sustaining; it was only in part that would be true.

Q. So your answer then would be that you considered the ground at the Yerba Buena tunnel partly self-sustaining and partly not self-sustaining?

A. That is true.

Q. If the ground was self-sustaining why were steel beams installed throughout the tunnel?

A. I think that is a question that a designing engineer only could answer; what the purpose was I could not say.

Mr. Tinning: If your Honor please, we would like to offer in evidence on behalf of the defendant a diagram, map showing the location of a number of tunnels, and I think all of the tunnels we thought of in the vicinity of San Francisco Bay. It is a diagram taken from a Government map, a photograph of a Government map, upon which we have indicated the location with approximate accuracy for the purpose of being used in connection with the testimony of this witness, and the table on the left shows the numbers which have been given to the different tunnels simply for the purpose of identification. We offer it as Defendant's Exhibit B. [721]

(The map was marked "Defendant's Exhibit B.")

[Set forth in the Book of Exhibits at page 323.]

(Testimony of Lewis Michael Larson.)

Mr. Tinning: Q. Mr. Larson, I will ask you to look at this diagram and I will point out to you various tunnels which are in existence at the present time, and I attempt to call your attention to various tunnels which were in existence at the time that you prepared your estimate. We have just been talking about the Yerba Buena Tunnel, which is shown on the diagram, Defendant's Exhibit B, as No. 15. On the portion of the map marked San Francisco, with the number 24, is indicated the most northerly tunnel on the bay shore. Are you familiar with that tunnel? A. In a large measure, yes.

Q. How long is it, approximately?

A. Approximately 2,000 feet.

Q. About 2,000 feet? A. Yes.

Q. What type of material was that tunnel constructed through?

A. That was a broken formation.

Q. Was the tunnel which is marked here as No. 24, and I assume from what you said that would be Tunnel No. 1 on the Bay Shore? A. Yes.

Q. Was that tunnel timbered during construction? A. It was.

Q. Was the timber removed in the same way that you have described in No. 4 tunnel this morning?

A. I believe all of it was, though my contact with it is not definite enough to say all, I think it was.

(Testimony of Lewis Michael Larson.)

Q. You were generally familiar with it during construction? A. Yes.

Q. As you were working on the same project?

A. Yes.

Q. Was that tunnel driven by a full face method?

A. It was not.

Q. Was it driven in the same way that Tunnel No. 4 was driven?

A. Very much the same way.

Q. The wall construction? A. Yes.

Q. The ring advanced ahead of the excavation and the masonry and [722] brick wall?

A. Yes.

Q. No. 23 is the subway for the Ferry Building. That I do not think is comparable. A. No.

Q. No. 16 shown on this map is the Stockton street tunnel. A. Yes.

Q. Now, were you familiar with the construction of that tunnel? A. Only from hearsay.

Q. Have you a knowledge of the general conditions from your general knowledge of tunneling in this area as to whether it was in self-supporting ground? A. I believe it was not.

Q. It was built by the ring method stulling against the core?

A. A good portion of it was.

Q. Wasn't all of it?

A. I understand that they started in without doing so and got into trouble.

(Testimony of Lewis Michael Larson.)

Q. And that then they stulled against the core and put in the concrete lining?

A. I believe that is true.

Q. And thereafter removed the core?

A. That is my understanding.

Q. And the lining of that tunnel is some two and a half feet at the top and some eight and a half feet at the base?

A. That I don't know.

Q. Would you say that the Stockton street tunnel was built in Self-supporting ground?

A. I would think not, because of the improvements alongside; that has something to do with it; you do not take any risk when you have apartment houses right alongside.

Q. Is the risk a different thing than where the ground is self-supporting?

A. Yes, you have to couple the two facts together; you will take a chance on self-supporting ground with no improvements that you would not take if there are any improvements that are likely to be damaged by your oversight, if there is one.

Q. So that you are not able to say whether or not the ground under the Stockton street tunnel through which the Stockton street tunnel [723] was driven was self-supporting ground?

A. I am not in a position to say.

Q. Even though it was driven with a temporary

(Testimony of Lewis Michael Larson.)

lining stulled against the core and the concrete lining installed before the core was romoved?

A. No, because I knew the conditions that preceded it, that had an influence on it.

Q. What were the conditions that preceded it?

A. The contractor who began it had, as I understand, little experience in tunnel work, and allowed the concrete to get beyond control, and that caused what we term a fear complex to the contractor and to the City, and a different method was then adopted, that assured against any accident or unwarranted hazard.

Q. What was the method that the contractor adopted that proved unsuccessful and installed the fear in the city?

A. My understanding is that they started in much like they would in an open cut with an open face method in the beginning, without developing the ground to see whether it had self-supporting features.

Q. In other words, instead of driving drifts into the ground which is to be excavated and exploring it ahead of the excavation, they undertook a full face operation and got in trouble?

A. That is the information that has come to me.

Q. Will you please look at No. 18, shown on this diagram, Defendant's Exhibit "B", which is intended to represent the Twin Peaks Tunnel? I understood you visited that.

A. Just as they were going underground. [724]

(Testimony of Lewis Michael Larson.)

Q. You also testified, I believe, that the materials encountered in the Twin Peaks Tunnel were not self-sustaining?

A. I could not say anything about that, because I saw it only at the beginning of the work.

Q. From your general knowledge of the conditions in the Bay region, founded upon the excavations of various tunnels, would you assume the ground encountered in the Twin Peaks Tunnel was self-sustaining?

A. I would have to answer that by enlarging upon the conditions there. You have a double-track tunnel that is unusually wide.

Q. How wide, approximately?

A. I am not informed on that; but there was a curtain wall, I think, in the center, to make provisions for pedestrians to go down, at different points in the tunnel, to enter the cars; and I believe that it is separated; that curtain wall may have been a sort of safeguard against passengers attempting to go over onto the other side. This is conjectural.

Q. What would that have to do with the method used in construction?

A. It would have a tendency to separate out the width of your tunnel, and leave a flatter arch; a flatter arch would be more difficult to hold than one that had an even circle all the way around.

Q. The design that is used in that tunnel, you

(Testimony of Lewis Michael Larson.)

could assume it had some control over the methods that were necessary in driving?

A. That, and the price of lumber. The price of lumber, I think, was $8.50 a thousand.

Q. Was there a great deal of timber used in the Twin Peaks Tunnel?

A. I could not say; I really don't know.

Q. Then, how would the price affect the driving?

A. Well, it is just inference that, if you could give either timber or concrete support to it, and your material price of lumber is very cheap, the tendency to put in lumber is increased by the price of the material to be erected; and where you might feel you could take a chance on [725] that untimbered tunnel, if the timber is cheap you will put it in.

Q. But you don't know what they actually encountered there, and you did not inquire, in connection with your preparation of the bid, or other bids for tunnels in this Bay area? A. I did not.

Q. Coming over to the tunnel which is marked "17" on the diagram,—the Sunset or Duboce Tunnel,—on which you prepared an estimate: I think you testified, this morning, that you thought part of the material through which that tunnel was driven was self-supporting, and part was not?

A. That is the understanding I have.

Q. Did you see that tunnel at any time during construction? A. I did.

Q. At what stage did you see it?

(Testimony of Lewis Michael Larson.)

A. I visited it from the east end,—that is, from this end of the tunnel; and the excavation then had advanced, as I recall it, about 1,000 feet from the east portal. The concreting operation was just beginning. Because of some heavy ground that was encountered at that point, the preparations for concreting, I believe, had just been completed, and they were about to pour.

Q. Was the portion of the tunnel, which you saw, timbered throughout? A. It was.

Q. Did you ever see the tunnel after that?

A. I did not; not until after it was completed.

Q. Did you see the tunnel again after that?

A. I have seen it since it was completed.

Q. As a matter of fact, that tunnel was timbered throughout, was it not?

A. I understand that there were portions there, at least in the drifts, where no timber was required; but, later on, it was fully timbered.

Q. How was that tunnel driven; was it driven by open face?

A. Driving two wall plate drifts, and a top drift, and then the connecting part, which we term "the ring," was done in it; and then [726] the core removed,—I think, in much the same manner as the wall plate drift that I had planned for the first 720 feet of the Broadway Tunnel.

Q. It is a fact, is it not, that the timbering in that tunnel settled during construction, and it was

(Testimony of Lewis Michael Larson.)

constructed some 8 or 10 inches below the original designed grade?

A. That is my understanding.

Q. And there were many difficulties involved in the construction of that tunnel?

A. On this end,—the east end, I believe; yes.

Q. That tunnel, you stated this morning, you considered was on partly self-supporting ground and partly in non-self-supporting ground?

A. From the report that I had on the tunnel, that was my conclusion.

Q. And the difficulties that were encountered in that tunnel,—the fact that a thousand feet of tunnel had been left open, the timber had settled,—so the tunnel had to be built on a different alignment from the original design—you had all those facts in mind at the time you prepared your estimate on the Broadway Low Level Tunnel?

A. I knew, in a general way.

Q. Well, you knew, then, what you are stating now, did you not?

A. Not all; no. Since then, I have made inquiry more in detail.

Q. Tunnel No. 19 is a tunnel under Fort Mason. I think, this morning, you stated that you did not recall having any particular knowledge regarding that tunnel?

A. I have very little knowledge of that.

Q. Do you know that that tunnel was built in 1913, prior to the construction of the 1915 Exposi-

(Testimony of Lewis Michael Larson.)

tion, and freight was carried through that tunnel?

A. That was the information I had.

Q. And that a large portion of those tunnels was built through sand and clays and soft rocks?

A. I did not have the details on it. [727]

Q. And that there were difficulties with slides?

A. No; I had not information on that,—on that angle.

Q. Mr. Larson, if you cannot see what I am attempting to point out here, will you tell me?

A. Yes, I think I can see from this point.

Q. Now, going north from San Francisco, we come to two tunnels on the Marin County shore: one is the Waldo Tunnel,—which, of course, was not constructed; that was No. 21 on the diagram, and that was not constructed at the time you prepared your bid for the Broadway Low Level Tunnel? A. It was not.

Q. Did you know about that Tunnel No. 20,—the Fort Barry Tunnel,—that is located on Government reservation?

A. Not until after my association on the Broadway Tunnel.

Q. Do you know, now, whether that is built on self-sustaining material?

A. Some of it was, yes.

Q. That is a timbered tunnel, is it not?

A. I think they recently lined it with concrete.

Q. Up to three or four years ago, and for a number of years, that tunnel was a timbered tunnel?

A. Yes.

(Testimony of Lewis Michael Larson.)

Q. A narrow, vehicular tunnel? A. Yes.

Q. About the size of the old tunnel that you observed when you were inspecting this Broadway Low Level Tunnel site?

A. Very similar in size.

Q. And was supported by timbers approximately the same size, was it not?

A. Yes, excepting at the portal.

Q. How were they supported?

A. Concrete lining.

Q. There were concrete rings in either portal in the heavy ground?

A. That is my information.

Q. So, you knew about that at the time you prepared your estimate for the Broadway Low Level Tunnel?

A. No; I knew nothing about [728] this.

Q. You learned about that after. Did you have any knowledge of the tunnel between Tiburon and San Rafael? A. No; I did not.

Q. Do you know anything about it now?

A. No; I do not.

Q. You haven't paid any attention to it?

A. It is a railroad tunnel.

Q. Yes. Coming across the Bay to Contra Costa County, I will ask you if you know anything about, or knew anything about, the Santa Fe Tunnel, on the road leading from the Richmond Station down to the old ferry wharf which ran through the Potrero Hills,—the range that lies between the Bay and the City of Richmond.

(Testimony of Lewis Michael Larson.)

A. I knew nothing about it.

Q. Have you ever familiarized yourself, since you made an estimate on the Broadway Low Level Tunnel, with the conditions there?

A. Not in this tunnel you are referring to.

Q. Immediately south of the Santa Fe Tunnel that I have referred to, is the tunnel which we have designated here as Tunnel 14,—the Richmond Tunnel,—vehicular tunnel,—which carries automobiles and other vehicles through the same range of hills that the Santa Fe Tunnel takes the trains through. Were you familiar with that tunnel at the time you prepared your estimate for the Broadway Low Level Tunnel? A. I was not.

Q. Are you familiar with it now?

A. No; I cannot say I am; I have paid no attention to it.

Q. You have no knowledge with respect to it?

A. I knew there was a tunnel there; but I knew nothing about the size.

Q. Knew nothing about the method with which it was constructed?

A. I knew nothing about the methods or the formation of the material.

Q. Proceeding farther towards the east, we find a tunnel which is [729] marked "Tunnel No. 2,"—The San Pablo Water Tunnel, constructed by the Eastbay Water Company, to carry the water from the San Pablo Dam through the hills into North Berkeley. You are familiar with that tunnel, and

(Testimony of Lewis Michael Larson.)

you were when you made your estimate for the Broadway Low Level Tunnel?

A. Only what I had explained to me at the time when I went in the Claremont Tunnel.

Q. When you were in the Claremont Tunnel?

A. Yes.

Q. At the time when you were in the Claremont Tunnel, did you learn that there had been a great many difficulties encountered in construction of the San Pablo Tunnel?

A. I heard there were some; I did not know how many.

The Court: What year was that?

Mr. Tinning: The tunnel was constructed, if I remember correctly, about 1915.

Q. That tunnel is something over two miles long, is it not? A. I don't know.

Mr. Wittschen: 1918 is the correct year.

Mr. Tinning: 1918, it was constructed.

The Witness: I don't know the length of it.

Mr. Tinning: Q. You heard there had been many difficulties encountered in that tunnel, and timbering was required throughout,—heavy timbering?

A. I heard there were portions of the tunnel where there was swelling ground, and it was difficult to hold, and they had encountered gas, where some men were killed.

Q. And the timbers were crushed by the swelling ground? A. Yes.

(Testimony of Lewis Michael Larson.)

Q. You did not consider that the area through which the San Pablo Tunnel was constructed was in self-supporting ground, did you?

A. I did not know; but I assumed a portion of it could not have been, on account of swelling ground.

Q. I will ask you to look at Tunnel No. 8, on this diagram,—[730] which is the Franklin Canyon Tunnel, of the Santa Fe—a tunnel approximately a mile long, built about 1899—one of the first large tunnels that was built through the Coast Range in the region of San Francisco Bay. Did you have any knowledge of the difficulties that were encountered and the materials met in the driving of that tunnel? A. None whatever.

Q. When you were preparing your estimate of the Broadway Tunnel, you made no inquiry regarding the history of that?

A. No. I really did not know, at the time, of the existence of that tunnel.

Q. I will show you tunnels Nos. 10 and 9, which lie—No. 10 lies on the west side of Alhambra Valley; and No. 9, on the east side, where the Santa Fe crosses Alhambra Valley. Those are two short tunnels. Were you familiar with them, when you—

A. I could not have been familiar with them; I did not even know of their existence at the time.

Q. When you were preparing your estimate on the Broadway Low Level Tunnel, did you know that Tunnel No. 11,—which is known as the Walnut

(Testimony of Lewis Michael Larson.)

Creek Tunnel, and which was constructed about 1926 or '27, on the line of the Eastbay Municipal Utility District Aqueduct—did you know about that? A. I knew, by hearsay, of it, yes.

Q. Did you ever inspect that tunnel?

A. I never did.

Q. Do you know what kind of materials were encountered there?

A. No; I do not.

Q. When you made your estimate on the Broadway Low Level Tunnel, did you know about Tunnel No. 6,—the Upper San Leandro Water Tunnel of the Eastbay Municipal Utility District?

A. I did not.

Q. And which is in the City of Oakland, and lies southerly of the Claremont Tunnel and the Broadway Tunnel and the other tunnels which lie immediately easterly of Oakland,—A tunnel somewhat over a mile [731] long?

A. No; I did not. This is the first I ever heard of that one.

Q. You did not know there were considerable difficulties encountered in driving that tunnel?

A. No; I did not know of the existence of the tunnel.

Q. Or you did not know whether that was driven in self-supporting material or not?

A. I could not know, not having known of the existence of the tunnel.

(Testimony of Lewis Michael Larson.)

Q. Did you know of Tunnel No. 5,—which is marked here as the Shepard Canyon Tunnel—the tunnel now used by the Sacramento Short Line,—a tunnel that was built through the hills about a mile southerly of the Broadway Tunnel, in 1911 or 1912, when the Oakland and Antioch Electric Line was constructed?

A. I knew of the existence of the tunnel, yes.

Q. When you were making your estimate of the Broadway Low Level Tunnel, did you make any examination of that Sacramento Short Line Tunnel? A. I did not.

Q. So, when you prepared your bid, you did not know that that had caused many difficulties in its construction; a number of men were killed; slides occurred?

A. I knew very little about the difficulties that were encountered.

Q. Did you know that timbering was used throughout the tunnel? A. I did not.

Q. Did you know that they had a slide near the west portal, which extended to the surface and required some 50 or 60 cords of wood to fill up the face of the void above the top of the tunnel?

A. I did not.

Q. When you prepared your estimate of the Broadway Low Level Tunnel, did you have in mind the material encountered in the Lafayette Tunnel

(Testimony of Lewis Michael Larson.)

of the Eastbay Municipal Utility District,—Tunnel No. 4? [732] A. Only in part.

Q. You were in charge of the work in the Claremont Tunnel,—which is shown as Tunnel No. 3 on this map? A. Yes.

Q. The Lafayette Tunnel was constructed contemporaneously with the tunnel on which you were working? A. It was.

Q. But you don't know what materials were encountered in that tunnel?

A. I knew some, yes.

Q. Well, generally, were the materials self-sustaining or not? I am referring to No. 4,—the Lafayette Tunnel?

A. Well, for a period of time, and in different parts of the tunnel.

Q. By that, do you mean a period of time shortly after excavation the material stood without support, and then, as time lapsed, began to require support?

A. That was my understanding.

Q. And the support that you understood, Mr. Larson,—to make it clear,—was support not to prevent the falling of rocks on the men who were working in the tunnel, but to maintain the integrity of the tunnel structure?

A. In part, yes; in fact, mostly so; but I also understood that material there was a softer material than the Orindan encountered in the Clarement Tunnel.

(Testimony of Lewis Michael Larson.)

Q. What kind of material was the Lafayette Tunnel driven through?

A. The major portion, I am told, was through the Orindan. I did not visit very often; I did not see very much of the tunnel.

Q. But that was your understanding: that it was an Orindan that was softer than you found in the Claremont Tunnel?

A. That was the information I had.

Q. You had that information when you prepared your bid on the Broadway Low Level Tunnel? A. I did; I knew of that.

Q. Tunnel No. 3, shown on Defendant's "B",—the Claremont Tunnel: that tunnel is a tunnel for which you prepared a bid for one man who was not successful; and you prepared an estimate, or a bid, [733] thereafter, for the successful contractor? A. Correct.

Q. You were in charge of that tunnel in 1926, May or June, I believe you said, and until the fall of 1929? A. Yes.

Mr. Marrin: Mr. Tinning, may I clear that up? I understood Mr. Larson's testimony to be that he prepared it for a contractor who was not at first successful and thereafter was the low bidder.

Mr. Tinning: I am not trying to make a point of it. I was just trying to ask about the testimony, because I have no notes.

Mr. Marrin: I see.

(Testimony of Lewis Michael Larson.)

Mr. Tinning: Q. My understanding of that was you prepared an estimate for one man, and he did not get the contract; and that, later, you went to work for Greer and Meade, as their tunnel superintendent in that construction, and remained in that capacity throughout? A. That is correct.

Q. I thought you mentioned Lindgren and Swinnerton? A. Twohy Brothers.

Q. Twohy Brothers? A. Yes.

Q. Before leaving the diagram, there is one other tunnel here that I would like to direct your attention to,—No. 7: the old Highway Tunnel. That is the tunnel you passed through when you were making your inspection of the ground,—the surface conditions surrounding the Broadway Low Level Tunnel? A. Yes.

Q. No. 7. As a matter of fact, when you were building the Claremont Tunnel, in that approximately three-year period, you passed through the old tunnel on many occasions, did you not?

A. I did.

Q. You were already very familiar with that tunnel? A. Reasonably so, yes.

Q. During the same time you were employed on the Claremont Tunnel—By the way, that was driven from both ends, was it not? A. It was.

Q. So, you had to travel from the westerly end to the easterly end [734] frequently, in your work, before the tunnel was holed through?

(Testimony of Lewis Michael Larson.)

A. Well, not before the tunnel was holed through. I was watching the west end excavation, but, after—there was 6000 feet of work—5000 feet of that tunnel driven from the end that I had nothing to with the driving of—but, later on, after the tunnel was driven through, I had occasion to go over there to do some reinforcing work in the tunnel; and that took me frequently through the old tunnel.

Q. Did you, when you were travelling back and forth, in connection with your work, between 1926 and 1929, also use the Fish Ranch Road?

A. I believe, very little. I may have made one or two trips over it.

Q. It was not your usual route?

A. No, no.

Q. The Claremont Tunnel and the Lafayette Tunnel were of substantially the same size and type of construction, were they not?

A. A difference of a foot, I think, in diameter.

Q. The Lafayette Tunnel was a foot larger than the Claremont? A. I think, the reverse.

Q. Smaller?

A. That is my understanding.

Q. They were both water tunnels? A. Yes.

Q. Both lined with concrete and with what we call an invert—they had a horseshoe shape above, and that was closed by a semicircle below?

A. I believe that is true, yes.

Q. I think you said the diameter. Both height and width of the finished Claremont Tunnel were 9 feet? A. That is correct.

(Testimony of Lewis Michael Larson.)

Q. And the excavation was 12 feet?

A. Approximately.

Q. This old tunnel that you testified about, and you have described in your earlier testimony, the old Highway Tunnel, between Contra Costa County and Alameda County, is how big?

A. I would estimate it to be about 16 feet wide; might be a little wider—about 12 to [735] 15 feet high; probably around 14 feet high.

Q. Well, I have made inquiry, and I think your memory is quite accurate. You would not say the figure was wrong, of 17½ feet in the clear, inside, between the timbers? A. No; I wouldn't.

Q. And 15½ feet high? It is certainly very close to your memory. Now, the timbering in this tunnel was 12 by 12. You recollect that?

A. I am not sure whether 12 by 12 or 10 by 10.

Q. As you drove through there, you noticed that these timbers were, in some places near the portals, somewhat distorted by the surface pressures in the surface of the ground, as you got into the interior of the tunnel; and the materials seemed to be standing well, and the timbers, you thought, were the same timbers that were installed in 1903 or 1904? A. That was my conclusion.

Q. From what you were able to observe and from any inquiry that you made?

A. Just my observation.

Q. You made no inquiries to ascertain if there had even been slides, in that tunnel, in which timbering had broken and people had been injured?

(Testimony of Lewis Michael Larson.)

A. I did not.

Q. Were you able to see that there had been a number of timbers replaced in that tunnel?

A. Near the portals, only.

Q. Near the portals. In the center portion of the tunnel, so far as you were able to observe, and in the formation which you said was the chert, you were unable to observe any retimbering?

A. I could not see that there had been anything done in the way of retimbering in that tunnel.

Q. How far apart were those timbers in there?

A. I estimate them to be 4 feet. I am not sure my estimate is correct.

Q. In that tunnel, as you passed through it, did you observe anything to indicate that there had been trouble, by water?

A. Not in the major portion of the tunnel; only at the portals. [736]

Q. What do you consider the portal; how far from the portal would you say falls within that definition?

A. Well, that portion of the tunnel that is effected by operations within, where the result of excavation might influence the structure there; and its extreme limit, I should say, probably is from 30 to 50 feet, depending on which end you are speaking of.

Q. Well, if there is a difference between the ends, please tell me; if you consider one end is a

(Testimony of Lewis Michael Larson.)

greater portion of a tunnel, or if you did consider more of a portion on one end than the other.

A. I would think the weakest portion of this tunnel would be the east end.

Q. Where the overburden is light, and where it is in the Orindan?

A. Well, yes; but probably fractured. Well, I am not sure that that is Orindan, by the way, on that end.

Q. How many feet, on the westerly end of the tunnel, would you consider within the portal area?

A. Approximately 40—between 30 and 40.

Q. Between 30 and 40?

A. Yes; that is a rough estimate.

Q. This Broadway Low Level Tunnel is built in close proximity to the—300 feet below the old tunnel that we have just been referring to? A. Yes.

Q. And the timbers used in the temporary support of the Broadway Low Level Tunnel were of the same cross-section—12 by 12—as the timbers in the old tunnel, were they not?

A. The timbers in the Broadway Tunnel were 12 by 12. If you are sure the timbers in the old tunnel were 12 by 12, I would agree with you.

Q. Well, I think it is, Mr. Larson.

The Court: We will take a recess now.

(Recess) [737]

(After recess:)

Mr. Tinning: Q. Mr. Larson, when you were inspecting this tunnel, the old highway tunnel, did

(Testimony of Lewis Michael Larson.)

you know how that tunel was driven, whether it was driven by the full face method or the wall plate method, or what method was used?

A. I have no knowledge of how it was driven.

Q. Would it have made any difference in your opinion that you formed as to the material through which it was driven if you knew that that tunnel was driven with a crown or top drift, and a bench against which arch timbers are supported by stulls until the plumb posts or vertical timbers were placed under the outer end of the segments?

A. It would not, because I relied on the geologist's report on its being self-supporting ground, consequently I would ignore that fact as sometimes the notion of, and often times that of an inexperienced tunnel man, you cannot judge that the method he used was the proper method and say you could follow the same method.

Q. Do I understand that your opinion as to the ground which was to be encountered in the Broadway Low Level Tunnel was formed from the geologist's report and that likewise that your opinion as to the ground that actually you could see in the old tunnel was formed from the geologist's report?

A. My observation of the ground in the old tunnel and my study of the general conditions, physical conditions there, was, I could not find anything that caused me to conclude that the geologist was wrong in his report.

Q. But his report did not refer particularly to the old tunnel, did it?

(Testimony of Lewis Michael Larson.)

A. It referred to the ground that was anticipated would be found in the new project.

Q. In the project for which you were preparing an estimate?

A. Yes, and that was covered by his report, and it was his report [738] that I relied on.

Q. Now, we are discussing the old tunnel of which you made a visual examination, and which you said previously in your testimony led you to believe that the material to be encountered in the new tunnel would be similar to that in the old tunnel.

A. That as I understood the geologist to say that same body of material, that is, the same cherts, would be encountered as is in the old tunnel; in that respect I felt that we could look for a cherts formation, and the self-sustaining quality of it I judged from what Dr. Louderback said in his report.

Q. In other words, you assumed from Dr. Louderback's report that the cherts that you might encounter in driving the new project would be similar in character and standing qualities to that which you discovered in the old tunnel?

A. No, that would be a misinterpretation of his report, I think.

Q. What did you assume then, Mr. Larson?

A. I assumed that the major portion of the cherts and the orindan, as he states in his conclusion, which was the definition of his previous re-

(Testimony of Lewis Michael Larson.)

marks—that the major portion of the tunnel, particularly as he emphasizes the cherts and the orindan formation would be self-supporting.

Q. I think we are talking about different things. I am asking you what you assumed by reason of your inspection of the old tunnel.

A. That there was no reason to change or doubt the conclusions that the geologist made regarding the material to be encountered in the Broadway tunnel.

Q. Did you regard the ground, the rock through which the old tunnel was constructed, as self-sustaining?

A. I had not formed any definite conclusion as to whether or not it was self-sustaining; that did not enter my mind at the time.

Q. Do you now consider that the material through which the old [739] tunnel was driven was self-sustaining?

A. I could not answer that, frankly.

Q. You used your observation of those materials as a basis for arriving at a conclusion, one of the bases for arriving at your conclusion as to what it would be proper to bid on a tunnel on a project of three and a half million dollars or more?

Mr. Smith: Not three and a half million, but two million.

Mr. Tinning: Q. Did you not form any opinion as to whether or not the material through which the old tunnel was driven was self-sustaining material?

(Testimony of Lewis Michael Larson.)

A. I did not view it in that light. I viewed it in this light, that I would encounter a cherts, and experience teaches underground men that generally the deeper you go into a formation the more self-supporting the material is, and since I had the authority of the geologist, whose opinion in that territory particularly should be as elaborate and sure of being a right conclusion as any that we could possibly get, I could see no reason for changing the thought that he had advanced in his report, after observing the old tunnel.

Q. And your connecting the two was then that the conditions that you observed in the old tunnel were such, coupled with the fact that you were going through a similar material at a deeper level, that these similar materials would be stronger at the lower elevation than they were in the old tunnel?

A. I had a right to conclude that from the geologist's report.

Q. At any rate, you did so conclude?

A. I did so conclude.

Q. Mr. Larson, I show you a photograph—this is one of 12 photographs which were taken of the old tunnel on the 15th of April, last Friday afternoon, and I will ask you if that is a fair representation of the conditions which you saw there when you inspected that tunnel three or four years ago?

A. Might I ask [740] where that is?

Q. That is the westerly portal looking toward the east.

(Testimony of Lewis Michael Larson.)

A. This is the west portal. I think the timbering, as I remember it, was slightly more distorted in the immediate vicinity of the portal, not the batter posts on the outside, but these segments.

Q. I show you a photograph, numbered 2, and ask you if that is a fair representation taken from the north looking toward the south—that would be looking toward the right-hand wall of the tunnel as you go east at the entrance.

A. At the west portal?

Q. Yes. A. I think it is.

Q. I show you a photograph, numbered 3—does it bother you to hold these? A. Not at all.

Q. Which is taken looking at the left-hand or the north wall at the west portal of the old tunnel and ask you if that appears to be a fair representation of the conditions as you saw them in 1934 when you inspected the tunnel?

A. I think so. I notice the timbers here are rotted off, showing they had been there for many years.

Q. I show you photograph No. 4, which is taken from a position inside of the west portal about ten feet looking toward the east and ask you——

Mr. Smith: We will state the situation as we understand it; in 1935, shortly after the slide occurred in the Broadway Low Level Tunnel there was a considerable amount of work in the east portal of this tunnel by Contra Costa County under a contract, and no portion of that work is shown in these photographs.

(Testimony of Lewis Michael Larson.)

(Thereupon a recess was taken while the Grand Jury reported.)

Mr. Tinning: I will continue with the statement. The photographs that I propose to offer here do not represent any portion of the re-timbering which has been done since 1934, so far as I know, and they [741] do not represent any portion of the work that was done in 1935, under a contract with Contra Costa County. If you will look at Photograph No. 4 I have just handed you, there appears to have been some retimbering done in there which I think is some maintenance work near the portal, and within a distance of 30 or 40 feet of the west portal, which was in the area that Mr. Larson stated that he had seen.

Mr. Smith: The only reason I called it to your attention is that the witness should know that it was not intended by you that these pictures were given to him as representative of the conditions existing at the time he went up there, before he made an estimate on the project in 1934, and the fact that the pictures were taken last Friday, that there has been considerable work done on it.

Mr. Tinning: I think I so stated in all my questions, if it was substantially representative of conditions as he found them, and it is only for that purpose.

Mr. Smith: That is all right.

Mr. Tinning: You have seen photographs 1, 2 and 3, and we were just asking you about 4.

(Testimony of Lewis Michael Larson.)

A. Yes, this illustrates the distorted condition of the arch timbers that I spoke of in my previous testimony. They are at a point of almost collapse, and yet at the same time nothing is being done about it which would indicate that the structures did not require much support.

Q. This area which you say did not require much support is in an area near the west portal?

A. It is where the conditions are more difficult than they will be further in the tunnel.

Mr. Smith: You are going to offer the whole group as one exhibit?

Mr. Tinning: Yes, the twelve photographs. [742]

Q. If you will look at the top of the tunnel you will notice that the number of segments in the ring changes from a three-segment ring to a four-segment ring, and apparently as you go east in the tunnel that four-segment ring is maintained as a type of arch to at least as far as the other portal, to where they take up again a portal structure: Is that your memory? A. Substantially.

Q. I show you a photograph taken on April 15, 1938, looking east away from the west portal along the south wall of the tunnel, taken 75 feet in, east of the west portal of the tunnel, and ask you if that represents the conditions in the tunnel substantially as they were when you inspected it in 1934?

Mr. Wittschen: For the sake of the record will you give the number of that photograph?

Mr. Tinning: That is No. 5, Mr. Wittschen.

(Testimony of Lewis Michael Larson.)

The Witness: I think it is at this particular point.

Q. I show you photograph No. 6, Mr. Larson, which was taken at a point 75 feet inside the west portal, looking toward the west, and ask you if that represents, in your opinion, a fair representation of conditions in the tunnel as they were when you inspected it in 1934?

A. I think it does. Of course, we are now speaking of a permanent timbering aspect where the operation is to be maintained year after year with timbers. I think that point should be emphasized.

Q. Well, at this time I am trying to learn from you whether you think that photograph No. 6 correctly represents the conditions as you saw them, or substantially represents the conditions as you saw them in 1934 when you inspected this tunnel.

A. I believe it does.

Q. I show you photograph No. 7, taken at a point 190 feet east of the west portal looking toward the westerly portal of the tunnel. [743] The photograph shows the south or left wall. Does that represent timbering in the tunnel substantially as you saw it in 1934?

A. In so far as I can tell from a photograph I would say yes.

Q. I show you photograph No. 8, which is taken 430 feet east of the west portal, the camera being approximately at a point on the north side of the tunnel, and I will ask you if that photograph repre-

(Testimony of Lewis Michael Larson.)

sents the conditions in the tunnel substantially as they were in 1934 when you inspected it?

A. I think I remember that particular point there, because there had been no maintenance work done, apparently, in the last 30 years in spite of the pressure as that had become evident at that time.

The Court: Tell me, is the arch here, are the timbers there?

Mr. Tinning: Yes, your Honor.

The Witness: That is a four-foot spacing, isn't it?

Mr. Tinning: I think so, yes. Especially in the center of the tunnel it seems to be. Our measurement indicates they are four-foot centers.

Q. I show you photograph No. 9, Mr. Larson, which is a photograph taken on April 15th, the same point as the preceding one, No. 8, 430 feet from the west portal, looking at the south side of the tunnel, and a view of the opposite side of the same portion of the tunnel that you were looking at in the previous view. Does that substantially represent conditions as you saw them in 1934?

A. I believe it does at that particular point.

The Court: That is to say 8 and 9 are opposite each other in the tunnel at that particular point?

Mr. Tinning: Yes, your Honor.

Q. I show you photograph No. 10, Mr. Larson, which was taken at a point 630 feet east of the west portal, and is a view of the south side of the tunnel. Would you say that that is a fair [744] representa-

(Testimony of Lewis Michael Larson.)

tion of conditions as you saw them in 1934 in the tunnel?

A. At that particular point, yes.

Q. At that particular point, yes. I show you photograph No. 11 taken April 15th, 1938, at a point 505 feet from the west portal of the tunnel looking easterly along the north wall.

Mr. Smith: East of the west portal, but looking east.

Mr. Tinning: Looking east. I ask you if you consider that photograph a fair representation of the conditions that you saw in the tunnel at that point in 1934?

A. I don't see any retimbering done, so I assume that to be the case; apparently it is.

Q. Well, what we had in mind in taking this photograph, Mr. Larson, was the apparent displacement or movement in the seven timbers down or away from the camera.

A. Of course, I have no knowledge whether that is a shift or whether they were placed in that position, and if a shift, nothing had been done about it in thirty years is evident.

Q. Well, I don't know anything about that, either. What I have in mind is just this fact, does it represent——

A. I believe it is a fair representation, yes.

Q. I show you photograph No. 12 which is taken with the camera 680 feet east of the west portal, looking at the south side of the tunnel, and it shows

(Testimony of Lewis Michael Larson,)

in this photograph the considerable spaces between the timbers and the rocks. Is that photograph, in your opinion, a fair representation of conditions as you saw them in the tunnel in 1934?

A. Yes. I note particularly the wall spaces in many places. I think it is a fair representation.

Q. You note the over-break?

A. Yes, but maybe careless shooting, I cannot tell.

Mr. Tinning: If your Honor please, we will offer in behalf of the defendant, as Defendant's Exhibit C, the 12 photographs we have just shown to Mr. Larson, the photographs being 12 in [745] number, and numbered 1 to 12.

The Court: How long was the tunnel?

Mr. Tinning: About 1300 feet, your Honor.

The Court: This was 680 feet, you say?

Mr. Tinning: 600 feet on the west end.

The Court: What is that, an opening there?

Mr. Tinning: Yes. That is where the timbers are standing without support from the rocks.

The Court: What about this?

Mr. Tinning: That is a flashlight picture of the tunnel.

The Court: You see how I was misled.

Mr. Smith: I thought that was an opening, too.

The Court: There are some distortions on these photographs. I don't say it is wilful.

Mr. Tinning: I made an offer, your Honor. I think there is no objection. It is simply demonstrative.

(Testimony of Lewis Michael Larson.)

The Court: They will be admitted and marked.

(The photographs were marked "Defendant's Exhibit C.")

[Set forth in the Book of Exhibits at page 324.]

Mr. Tinning: Your Honor, I made a mistake in figures. The tunnel is 1040 feet long.

The Court: I got misled on it.

Mr. Tinning: Q. Mr. Larson, it is a fact that near the portal of this old tunnel and for a considerable distance toward the east from the west portal, and toward the west from the east portal, that timbers are placed much closer than four feet, is it not?

A. Yes. That is customary near portals.

Q. Yes. That is a fact in this tunnel.

A. I believe it is a fact in this tunnel.

Q. And the timbers, now that we have seen the photographs, you have no difficulty in determining these timbers are 12 by 12 [746] timbers?

A. I believe them to be, yes.

Q. When you commenced to prepare your estimate for the Claremont Tunnel for Twohy Bros. did you go in the field?

A. I made one visit to the portals of the tunnel, proposed portals of the tunnel, but I relied there again on the geological report.

Q. Whose geological report did you rely on?

A. Hulin.

Q. The Hulin geological report?

A. Yes. Dr. Louderback told me he had appointed Hulin to look after that.

(Testimony of Lewis Michael Larson.)

Q. You knew Dr. Louderback at that time?

A. I knew Dr. Louderback shortly after I went to work on the tunnel.

Q. So that at the time you read the Hulin report you were not familiar that he was vouched for, or appointed to this work upon Dr. Louderback's suggestion?

A. I learned that from Dr. Louderback later on.

Q. Did you read the Hulin report on the geology of the Claremont tunnel before you prepared an estimate? A. I did.

Q. Did that report predict any swellings or heavy ground?

A. I don't recall that it spoke of swelling ground. It spoke of the different formations that would be encountered beginning at the west portal, and I want to remark here that it was remarkably accurate as to the changes, at the points where changes might occur, where uplifts would fracture the formation. In fact, it was a very accurate report, as I recall it.

Q. The Hulin report, then, was very accurate as to where you would pass from one formation into another?

A. That is my recollection, it was.

Q. And that it was also accurate as to where you saw uplifts, that is where some other structure passes up, or came up into the line of the tunnel?

A. As I understand it, the uplift, for example, at the farthest faulted line, the San—I have [747] forgotten the name of that now, he spoke of a

(Testimony of Lewis Michael Larson.)

vertical uplift of 150 feet. To me that meant just that, a vertical uplift, and where we would likely find a fault.

The Court: What do you mean by an uplift?

A. Where one side is stationary and the other one is raised.

The Court: Two different formations?

A. Well, yes. We will say it is like in this position by nature, and something causes one side to rise up vertically.

Mr. Tinning: Q. And his report was remarkably accurate in the prediction of the points at which you would find uplifts and where you would pass from one formation into another?

A. With some exceptions, but in the Orindan and in the cherts that was particularly true. On the west end he spoke of the Franciscan formation for a certain distance. Then we passed into Chico sandstone. Now, there was an intermediate formation in there that no one had anticipated, an old river bed, and then from that into a serpentine, and I believe that was not anticipated by Hulin. He mentioned, however, in his preliminary report, that that section of the tunnel was so covered with improvements and buildings that it was difficult for him to make an accurate estimate.

Q. What was the second formation? You said Chico sandstone and then Franciscan.

A. Franciscan sandstone, and then the Chico sandstone, none of which were anticipated for the

(Testimony of Lewis Michael Larson.)

Broadway Tunnel, so we have to exclude that in our preparation. Then we ran into cherts, which we anticipated to find in the Broadway tunnel, and in that Orindan which we anticipated, and then we ran into a lava in the Hulin report that it was anticipated would not exist in the Broadway tunnel, so we had only two formations that were comparable; that was the Orindan and the cherts.

Q. Claremont cherts in both tunnels?

A. I think Dr. Louderback [748] called them Claremont cherts.

Q. In the Claremont tunnel did you strike the Claremont cherts at the point—let me withdraw that. How far from the point predicted by Professor Hulin did you actually encounter the Claremont cherts when you were driving the tunnel?

A. I think it was very close. I could not tell you in regard to the exact feet, but my recollection is now it was very near the point. There was some little mistake in stationing and I have forgotten.

Q. What do you mean by "very close"? Would you say 500 feet?

A. Oh, no. I think it was within 100 feet, or 50 feet, probably.

Q. Within 50 feet or 100 feet?

A. Yes, that would be the extreme. I am speaking now of the cherts and the orindan.

Q. The Hulin report indicated to you, did it not, that you would require substantial support in driving the Claremont tunnel?

A. In certain localities.

(Testimony of Lewis Michael Larson.)

Q. Was there any place in the tunnel where the report indicated that you would not require tunnel timbering?

A. My memory on that—my recollection on that is not clear.

Q. Well, do you recollect when you made your estimate whether you figured on any place that you would not require timbering?

A. No. The way I estimated that was that in the plans we were furnished the timbering was stated, the size of the timbering, and the spacing of the timbering, and we were to bid on the placing of those timbers at that spacing, with timbers of that size. As I recall it, there was no designation as to distance that those timbers might go, whether clear through the tunnel or through only a portion of the tunnel. My memory is not clear on that.

Q. Well, in making up your estimate did you assume that timbering would not be required in any portion of the Claremont tunnel? [749]

A. I am not clear on that. I am not sure that I did know.

Q. As a matter of fact, it was required throughout the tunnel, was it not?

A. It was used throughout the tunnel, but not really required in the cherts. If I had known as much about the cherts as I learned after penetrating it I could have left the timbers out except at the fault line.

(Testimony of Lewis Michael Larson.)

Q. How many feet of cherts did you encounter in the Claremont tunnel?

A. My recollection is 1055 feet.

Q. What was the characteristic of that material with respect to requiring support?

A. When entering it we ran into what was termed wildcat fault, that was underneath. We moved through a considerable flow of water. Anticipating that possible trouble I had connected the invert up not to have a soft bottom to operate trains on, and also anticipating possible trouble from oil and gas that the Hulin report indicated might be encountered, I had taken the precaution of putting in about 170 feet of completed rings as a firebreak in case of fire that should develop in the cherts section. When the cherts section was penetrated for a depth of about 120 feet we ran out, as I recall it, of the major trouble in the cherts. We had some difficulty in penetrating it on account of the amount of water. We drove our spiling rather carefully and, as I recall it, traveled through this less soft material and later on it developed when we got to the fault zone that it could be pulled, the wedges could be pulled with your fingers, the wedges that were lying between the places at the corner of the segment and the segment, itself, just to determine whether or not weight came from cherts.

Q. This 125 feet of rings that you installed, was

(Testimony of Lewis Michael Larson.)

that installed in the broken material encountered as you passed through the wildcat fault?

A. No. That was when I knew I was coming to [750] the fault.

Q. That was in the Chico sandstone?

A. Yes.

Q. I mean in regard to the broken area, the broken material which you encountered as you passed through Wildcat fault.

A. I drove in spiling and in some places where necessary I did breastboarding.

Q. In other words, you had a broken material which you faced that you had to use breastboarding to handle the material?

A. Yes. That was particularly true on account of the bad formation that we encountered.

Q. How much water did you have in the tunnel, in this 12 by 12 drift tunnel that you had at this point when you passed out to the end of the cherts?

A. Dr. Louderback, in the geological report——

Q. How much did you have? What quantity of water per minute in gallons?

A. 700 gallons, according to the geological report of Dr. Louderback, on the Broadway Tunnel. He refers back to that.

Q. Did you take any measurement? You are referring now to Dr. Louderback's geological report, which is in evidence.

Mr. Smith: The witness says that the report——

Mr. Tinning: Of course, we are not asking him what the report says.

(Testimony of Lewis Michael Larson.)

The Witness: The district had a weir outside the tunnel where measurement was made on the amount of water. That weir, the District Engineer told me later on, was about 20 per cent. below accuracy. Whether Dr. Louderback took his 700 gallons—that would be the basis of my information, it would have to come from that weir, I have no note at the present time.

Q. Well, how much flow is 700 gallons a minute, how much flow would that give you on the bottom of the tunnel?

A. The invert—I think, possibly 10 inches over the invert was the flow. That is approximate and only an estimate. [751]

Q. Did that mean your tracks were covered by water 10 inches in height?

A. It should be about the top of the rails, in the invert,—where the invert was placed; but, of course, considerably over the rails where there was no invert.

Q. How close were those timbers placed in this area where you were driving the spiling and supporting the roof and sides against this loose material and water?

A. My recollection is 6 feet.

Q. 6 feet?

A. That is my recollection.

Q. Did you have any crushed timbers there, after you set your first sets?

(Testimony of Lewis Michael Larson.)

A. I have a recollection of not going through, that weight, on the timber.

Q. No weight even in that broken area?

A. I was afraid I was going to have weight; and I watched it very closely.

Q. Did you encounter any considerable flow of water in the driving of the timbers?

A. After I passed through the chert, I came into the orindan; I left the orindan, and came into the lava; and, in the lava, I had a very considerable amount.

Q. When you were in the orindan, what kind of conditions did you encounter?

A. Dry and very dusty; and in portions where the silt—as I have observed it, where the deposit, in flood times, in either rivers or lakes, comes—when this dries, it cracks wide open, in that mud portion; and in the other portion, where willows grow, it is a sort of gravel, and that is the conglomerate portion of the orindan.

Q. Do I understand that this material, then, is in layers, in varying thicknesses, where you have these clays, or what you say is mud, usually the mud dries and then you find gravel, and the layers, otherwise, alternate as you go through the material?

A. That was the condition,—running through a layer of probably clay and silt; then you would run into gravel, and so many other [752] materials in it, it caused a conglomerate mass; and then into some more of the other gossan.

(Testimony of Lewis Michael Larson.)

Q. Did these materials stand well?

A. Very well.

Q. Did you have to use timbers on them?

A. I did, as a precaution to the workmen, who were likely to be injured by spalls falling off. There would have been no need for it in the conglomerate sections, as I later observed.

Q. How thick was that section of this mud, as you call it?

A. My recollection is it varied,—75 to 100 feet; and then, 50 to 75 feet of the conglomerate; and then back into the other; probably varied about 100 feet.

Q. Were those layers, when you encountered what you call dry mud—was that a homogeneous layer,—all of the same material for 100 feet, or 50 feet, or whatever it might be?

A. As near as I could observe, it was.

Q. When you got into the gravel, what you call this cemented material—the conglomerate—was that also homogeneous?

A. As I observed it, yes.

Q. In the Claremont?

A. Yes.

Q. When you got into the lava, what did you encounter?

A. I encountered a usual broken formation that you find in lava rock,—a soft, easy-drilling rock; and in this particular case, it carried a great quantity of water.

(Testimony of Lewis Michael Larson.)

Q. What quantity of water did you encounter in that tunnel?

A. I think the weir I spoke about recorded 4,000 gallons per minute, or a little bit better. I would say it would be about 5,000 gallons per minute, all told.

Q. What kind of a stream flow did that give you on the bottom of the tunnel? [753]

A. The motors that we used,—five-ton motors,—when they would be going against the current, the men riding on the motors had to raise their feet up on top of the motor, in order to clear and keep them from being washed by the water. In going out of the tunnel, with the direction of the flow toward the west portal and downstream, of course the water would reach up and cover the wheels for about 18 inches.

Q. In other words, you would have, above the tracks, water somewhere in the vicinity of 18 inches or so?

A. That is my guess.

Q. What grade was the tunnel on?

A. .00076.

The Court: We will take an adjournment until tomorrow morning.

(Thereupon, an adjournment was taken until Wednesday, April 20, 1938, at 10 o'clock a. m.) [754]

(Testimony of Lewis Michael Larson.)

Wednesday, April 20, 1938

Mr. Marrin: If your Honor please, on page 289 of the transcript of the proceedings of yesterday there appears this ruling:

"The Court: As a legal matter I will sustain the objection, the objection is good,"

and no exception appears to be noted in the transcript.

The Court: At what point was that?

Mr. Marrin: That is when we were talking about the admission of a recast which Mr. Orselli made of the Larson estimate.

The Court: If my memory serves me I indicated that I would sustain the objection at this time.

Mr. Marrin: That is correct.

Mr. Wittschen: I would suggest that the record show that Mr. Marrin took an exception to the ruling.

The Court: I made the ruling, if my memory serves me, that I would sustain the objection at this time. Is that disclosed in the record?

Mr. Marrin: I think it is.

The Court: I want to know. I have a definite state of mind. I want both sides to have a record on any disputed point. Read the record.

(Thereupon counsel read the record.)

The Court: That is sufficient. That is the reason I said I would sustain the objection at this time. You may renew your offer at any other time that you see fit, and at that time I shall consider it. That

(Testimony of Lewis Michael Larson.)

is what I had in mind at that time when I used the language "I sustain the objection at this time," that it would not preclude you at any future time you saw fit when you develop the facts to make any offer.

Mr. Marrin: The only point I had in mind is the first time [755] your Honor ruled on the matter the record does not show we note an exception.

The Court: All right, let the record note an exception.

Mr. Alexander: May we also on behalf of the Cross-complainant note an exception?

The Court: Very well, let the record note an exception in both instances.

LEWIS MICHAEL LARSON,

Cross Examination (Resumed)

Mr. Tinning: Q. Mr. Larson, going back to the Claremont Tunnel, in the preparation of your estimate you said that you made one visit to the site of the tunnel, as I understand it. Is that the fact?

A. That is my recollection.

Q. And only one visit?

A. I recall only one, as there were just a few portals that were visible, portal locations.

Q. Did you at the time you prepared your bid have available for your use a copy of the geological report of Mr. Hulin, that you referred to?

A. It is my recollection that I had that.

(Testimony of Lewis Michael Larson.)

Q. Including the maps attached to it, profiles of the tunnel, showing the formation?

A. I believe I had, that is my recollection.

Q. Was there any mention made of those in the specifications?

A. I could not say definitely "Yes" or "No" to that question.

Q. I believe you said yesterday that to the best of your recollection the Hulin report did not predict heavy or swelling ground.

A. That is to the best of my memory.

Q. Did you consider you were misled by the Hulin report?

A. Well, possibly, but my estimate not having been used, or not being the one that landed the bid, I thought that would be immaterial. [756]

Q. Well, the question now is not whether it was material, but were you misled by the Hulin report?

A. I rather think that the developments later on would lead me to believe that the Hulin report did not cover all the difficulties that might be anticipated, in fact I think it minimized the difficulties.

Q. Now, is it your present statement, then, that you were misled by the Hulin report?

A. I think it would be better stated, that I did not comprehend all the difficulties from having read that report, that the report, itself, was not comprehensive enough to go into all the details; it went into many of them, some of which I believe varied slightly from what was predicted by Mr. Hulin, but others quite materially.

(Testimony of Lewis Michael Larson.)

Q. Yesterday you stated that it was a remarkably accurate report.

A. As to location of changed formation.

Q. And that it was accurate to the best of your recollection within the limits of 50 to 100 feet in its prediction at what place you would pass from one formation to another?

A. That is my recollection.

Q. Did the man who built that tunnel abandon the work because the Hulin geological report was misleading?

A. He did not abandon it for any reason.

Q. He completed it?

A. He completed it.

Q. And he met the difficulties which you say were not outlined in the geological report?

A. He met any difficulties that developed.

Q. When you were preparing this bid did you consult the chief engineer of the district, Mr. Davis?

A. I did not.

Q. When you were preparing this bid did you consult F. W. Hanna, the designing engineer of the East Bay Municipal Utility District?

A. I did not.

Q. When you were preparing this bid did you consult Mr. Munn, the [757] engineer in charge of the work?

A. Not at that time.

Q. Not until after the contract?

A. No.

(Testimony of Lewis Michael Larson.)

Q. In other words, in preparing that bid you had the specifications, the geological report, and your general knowledge of tunnels gained by your years of experience?

A. That is true.

Q. And at this time you cannot tell us whether you were misled by Mr. Hulin's report or not when you prepared that bid?

A. I think the use of the word "misleading" does not quite carry the thought that I had in mind; any report, if you run to the point of splitting hairs, you might say is misleading one way or the other; in general, the difficulties that were encountered were greater than those that I had drawn the conclusion would be encountered from reading the report, the Hulin report.

Q. A few moments ago you said that a man must be able to comprehend the report when he read it; that is true, is it not?

A. That is a matter of degree, again.

Q. Of experience?

A. Yes.

Q. Were there any drifts or test holes or borings at the site of the Claremont Tunnel?

A. No, not that I have any recollection of.

Q. When you were preparing your bid did you examine the cherts outcrop of the Fish Ranch Road which you examined when you were preparing your bid for the Broadway tunnel?

(Testimony of Lewis Michael Larson.)

A. At that time I did not know of this outcrop on the Fish Ranch Road.

Q. That outcrop on the Fish Ranch Road is nearer to the Claremont Tunnel than it is to the Broadway Tunnel, is it not?

A. That is my belief.

Q. The map shows, does it not, Defendant's Exhibit B, that the Claremont Tunnel passes very close to the outcrop?

A. I do not question that, I have never checked up on that, but I think that is a reasonable conclusion.

Q. From your general knowledge of that topoggraphy that is true? [758]

A. Yes.

Q. When you prepared the bid for the Claremont Tunnel did you consider that the ground in the tunnel would be self-supporting?

A. I cannot recall at this particular time the thought that I had as to that ground. I do recall that the district, the East Bay Municipal Utility District, prepared plans showing the type of timber that was to be used or the size of the timbers, and the spacing of the timbers, but whether I connected that with the full distance of the tunnel, I have not any clear recollection of at the present time.

Q. What was the spacing shown on the timber plan that you refer to?

A. As I remember it, two feet centers.

(Testimony of Lewis Michael Larson.)

Q. You have looked at that plan since yesterday, haven't you?

A. No, I have not.

Q. I think you stated yesterday that they were 4-foot centers.

A. No, I think that is a mistake, 2-foot centers and 8 by 8 timbers.

Q. And it also showed a plan immediately following the one you have referred to of circular timbers for heavy ground out of 12 by 12 timbers, did it not?

A. That is possible. I have not any clear recollection on it.

Q. And the specifications also required the contractor to place timbers of any size requisite to support the tunnel during construction?

A. That is true.

Q. That was also true of the Broadway Low Level Tunnel?

A. I think the difference in the two tunnels in the specifications lies in this, that there was no intimation in the specifications that the timber should be removed; I think in the geological report that there was no statement that the tunnel ground would be self-supporting, as it was in the Broadway.

Q. In other words, the distinction that you now draw between the [759] specification in the Claremont Tunnel and the Broadway Tunnel is in the case of the Claremont Tunnel the specifications did not call for the removal of the timbers and the plans

(Testimony of Lewis Michael Larson.)

did provide for the timbering of the Claremont Tunnel, is that correct, while in the Broadway Tunnel no plan was provided, and there was also a provision which you say called for the removal of the timbers?

A. That was my understanding of the specifications, yes.

Q. And when you read those Broadway Tunnel specifications you also read the provision that it could be removed or should be removed by the contractor if the District Engineer required it?

A. No, I would not state it that way, that it would be permitted to remain in if the District Engineer permitted it.

Q. If he permitted it?

A. Yes.

Q. You read that provision?

A. I read that provision.

Q. Now, I was going back to the Claremont Tunnel, you testified that there were two comparable formations in the Claremont Tunnel with those that were predicted for the Broadway Tunnel?

A. That is correct.

Q. And as I understand it you meant by that the cherts and the Orindan?

A. Those are the two that I meant.

Q. As a matter of fact, there was considerable volcanic material predicted in the Claremont tunnel, was there not?

A. That was in the lava formation; it is not existant in the Broadway Tunnel.

(Testimony of Lewis Michael Larson.)

Q. I did not hear.

A. That was in the lava formation which does not appear in the Broadway.

Q. It does not appear?

A. It did not appear at all in the Broadway.

Q. I understood you to testify that you had read the Louderback report from pages 13 to 19, Mr. Larson, that is the part dealing with the tunnel.

A. I think you are right. [760]

Q. I will ask you to look at Plaintiff's Exhibit No. 22, at page 14, and will ask you if you read this paragraph—I am reading the first paragraph,—headed "Claremont Cherts."

"After leaving the sandstones the prevailing formation for about 1200-1300 feet, is the Claremont Chert (called Claremont Shales in the San Francisco Folio of the U. S. Geological Survey). This formation consists chiefly of a series of alternations of layers of chert from 2-6 inches or more thick, and somewhat thinner layers of siliceous shale. Occasionally a layer of clay shale, sandstone, siliceous ferruginous limestone, or volcanic ash is encountered."

When you read this report did you observe the reference to volcanic ash?

A. I believe that I observed all that was in the report, and then I took Dr. Louderback's——

Q. Just a minute.

Mr. Smith: Just a minute, let him finish.

(Testimony of Lewis Michael Larson.)

Mr. Tinning: I have a right to have an answer.

The Court: Answer the question and then explain.

Mr. Tinning: Q. Did you read this paragraph?

A. I did read this paragraph.

Q. Now make any explanation you wish.

A. And then I read through all of the details and at the conclusion entitled on page 18, "Tunnels in General," the geological summary or definition of all of the preceding.

Q. You took the definition instead of the detail, that is a summary of your testimony?

A. I surely did, because that was his interpretation of his own remarks.

Q. That was your conclusion?

A. Yes.

Q. But you observed in the Louderback Report when you were preparing your bid the reference to volcanic ash which appears on [761] page 14 of Plaintiff's Exhibit No. 22?

A. I did. I read all of those general remarks.

Q. Now, we will return to the Claremont Tunnel. It is true, then, that in addition to the two formations predicted in the Claremont Tunnel you referred to, the cherts and the Orindan, that there was another formation predicted of lava, in which you found volcanic ash when you drove that tunnel?

A. Yes, I found the volcanic ash as interpreted to me at that time as volcanic ash on the contact between the Orindan—as a matter of fact it was

(Testimony of Lewis Michael Larson.)

after we had passed into the lava formation, within a distance of 60 feet before we encountered that volcanic ash, that was lying in the volcanic formation.

Q. And likewise in the driving of the Broadway Tunnel volcanic ash was encountered, was it not?

A. I could not say to that, I don't know that it was.

Q. You don't know that it was?

A. I don't know that it was.

Q. That might have been encountered after you left. You know what you went through while you were there?

A. I believe I do.

Q. Now, the Hulin report, to refresh your memory with reference to the cherts reads as follows: "Station 108-118, thickness 1,000 feet"——

Mr. Smith: What are you reading from?

Mr. Tinning: The Hulin report.

Mr. Smith: I thought you were reading from something else.

Mr. Tinning: This is the Hulin report.

"Claremont Cherts. Consist of thin layers (1 to 3 inches) of hard but brittle cherts, interbedded with thin (¼ to ½ inches) layers of shale. A few beds of sandstone and extremely hard, tough limestone occur; thickness 1 to 3 feet. The cherts will be hard on drill steel." [762] You knew that from past experience?

A. Yes.

(Testimony of Lewis Michael Larson.)

Q. "But due to their brittleness should break well." I suppose by "breaking well" it means cut off so that you will get a clean line of breakage instead of breaking over a large over-break?

A. It refers particularly to the shattering, that it shatters well.

Q. So that by use of powder you can take it out without having too large pieces to handle?

A. That is correct.

Q. "They should stand well and require little timber. Since the beds stand practically vertical no trouble from slabbing should occur." "Slabbing," I understand, is horizontal or nearly horizontal layers that might fall because those layers were standing more or less vertical?

A. Yes.

Q. You would not have that to contend with?

A. That is generally true.

Q. "The cherts are bounded on the west (Station 108) by a major fault line. The fault is located with a probable accuracy of 50 feet." What I read to you is from page 5 of the Hulin report. Do you remember that?

A. In general, yes.

Mr. Smith: I suggest that the witness be allowed to look at it.

Mr. Tinning: It is a document of the District. I will let him look at it. I have no other copy.

Mr. Smith: You are asking to test his memory on a document he looked at 12 years ago.

(Testimony of Lewis Michael Larson.)

Mr. Tinning: That will not make any difference. He can look at it if he does not think that is right.

A. I think it is [763]

Mr. Tinning: Q. It has been some time since you have seen it, but you don't question that that is a copy of the report?

A. No; I really think it is.

Q. Will you look at the back of it and see the diagram in the back?

A. I think that is a true representation.

Q. You think that is the report?

A. I do

Mr. Smith: I don't question the report. I just imagine the witness has not seen it for many years, and was entitled to see what you were bringing out.

Mr. Tinning: Q. On page 6 of the report, under the heading "Gas Problems," we find the following matter with respect to the Claremont cherts:

> "The Claremont cherts between these stations—" and they are referring to Stations 108 and 118—
>
> "The Claremont cherts between these stations belongs to the formation which is the source of much of the oil in California. The cherts of this belt, even on the surface, have an appreciable bituminous odor. While the structure here is not favorable for the accumulation of great quantities of gas, it is practically certain that some gas will be encountered.

(Testimony of Lewis Michael Larson.)

"It will be recalled that the explosion which occurred in the San Pablo-Wildcat Tunnel of the East Bay Water Company a few years back resulted from gas derived from this same group of rocks, and under very similar structural conditions."

I believe that the Wildcat or San Pablo Tunnel, which is shown on that map as No. 2, Defendant's Exhibit "B," the tunnel you said you had knowledge of when you prepared your bid on the Claremont and also when you prepared it on the Broadway Tunnel—

A. I had some knowledge,—rather indefinite.

[764]

Q. Then, under the heading of "Water Problems" on page 7:

"Water in quantity need not be expected except between Stations 66 and 88."

Those stations are the stations within which the lavas appear on the map?

A. Yes.

Q. "The lavas, the predominant rocks between these stations, are prone to be traversed by numerous fractures, the result of folding and also shrinking on cooling. The rocks therefore tend to contain numerous open waterways. The interbedded fragmental volcanic material, likewise, tends to be porous.

"The structure between Stations 66 and 88, that of a syncline or basin, is decidedly favorable for the accumulation of water, diverting

(Testimony of Lewis Michael Larson.)

all the surface drainage of the area underlain by the lavas towards the trough of the fold.

"It may be pointed out that the wells of the East Bay Water Company in Upper Wildcat Canyon, and also the numerous springs which occur on the east slope of the range (Stations 50 to 60) derive their water from these lavas. The flow of water from the lavas which may be expected in the tunnel may be expected to have some effect on the ultimate producing capacity of these springs and wells.

"Water derived from these lavas in the tunnel may be expected to be quite free from surface pollution, and might well be added to the water supply of the Utility District."

As a matter of fact, you recollect reading this?

A. In detail, it is refreshing my memory.

Q. It is refreshing your memory, as we go further. As a matter of fact, in the lava, you got practically up to the amount of 4,000 gallons per minute of water?

A. Yes; that amount registered on the weir.

Q. In the chert—Mr. Hulin's report then refers to water in the [765] chert, in the portion headed "Water Problems." In the chert, you got up to 600 gallons per minute?

A. According to Dr. Louderback's report, respecting the Broadway Tunnel, he reported 700 gallons per minute.

(Testimony of Lewis Michael Larson.)

Q. I am asking you if you do not recollect, in your own information, the data you gathered as you went further.

A. I think that is approximately correct.

Q. So that you had a great deal of water in the chert, and I think you told us yesterday sometimes you had as much as 10 inches above the top of your rails?

A. At times——

Q. I understand. You are correct. When you went through the chert, you had 600 gallons per minute of water, and it came up about to the top of the rails?

A. Yes, according to my recollection.

Q. And in this Hulin report, you have no recollection anywhere of seeing anything regarding there being heavy, moving or swelling ground?

A. I have not, at this distance, any recollection.

Q. You mean distance in time?

A. Distance in time, yes.

Q. Not distance from me?

A. No.

Q. So far as you know, there is nothing in the report?

A. So far as I know; I don't remember there is anything in it.

Q. Well, I think you are correct.

A. It might be full of it, for all I know. My recollection is not clear on it.

(Testimony of Lewis Michael Larson.)

Mr. Tinning: Your Honor, this report—we have no copy of this report; but I have marked up my working copy, and I have marked this up, and I am going to prepare another one, and, with counsel's cooperation, I will ask to offer it at a later date.

The Court: Very well.

Mr. Tinning: Will there be any——

The Court: You can offer it, and withdraw it, if you wish. You may offer it for the record, if you wish. [766]

Mr. Tinning: Well, we will then offer the Carlton D. Hulin report, dated April 27, 1926, entitled "Preliminary Report Upon the Geology of the Claremont Tunnel, East Bay Municipal Utility District."

Mr. Smith: What is the date of that, Mr. Tinning?

Mr. Tinning: April 27, 1926; to which is attached a Claremont Tunnel geological map. May I ask to have this marked Defendant's Exhibit "D"?

(The documents were marked "Defendant's Exhibit "D.")

[Set forth in the Book of Exhibits at page 337.]

Mr. Smith: It will be received preliminarily until we have a chance to examine it, will it, your Honor?

The Court: Yes, subject to any correction.

Mr. Smith: May we take this copy, your Honor, over the noon hour?

The Court: Certainly.

(Testimony of Lewis Michael Larson.)

Mr. Tinning: Mr. Smith, I would like to have that back for a moment. I have some other examination that I desire to use it on. This, gentlemen, is a copy of the geology map attached to the Hulin report; and I am going to hand this to Mr. Larson.

Mr. Smith: You state it is a correct copy?

Mr. Tinning: It is a photostat.

Q. Mr. Larson, where, on that map, at what station, is the westerly boundary of the chert formation; on what station does that appear?

A. Approximately at Station 122—no; I am reading the wrong way. Station, approximately, 118.

Q. 118. Where is the easterly boundary of the chert shown?

A. Approximately at Station 106.

Mr. Smith: The stations are from east to west on that?

The Witness: Yes.

Mr. Tinning: Yes. [767]

Q. Mr. Larson, don't you think you had better check that last statement? I think that the station numbering is quite some distance below the tunnel line and the easterly boundary of that chert formation is at about 108, when projecting it out?

A. Yes; you are correct on that.

Q. Yesterday, you stated you felt, and you have again today, that Mr. Hulin's report was remarkably accurate in determining the location of various strata. Isn't it a fact that you first encountered the chert at 121 plus 90 or 92?

(Testimony of Lewis Michael Larson.)

A. I haven't any recollection of that.

Q. Well, if that was the fact, it would be that he missed it by about 400 feet, wouldn't it?

A. Assuming your statement, yes, that would be correct; but let me draw attention, again, to something I noted yesterday: There had been a mistake, somewhere in there, on the stationing. With that correction of the stationing taken into account, my recollection is that his location of the fault lines was reasonably close.

Q. I don't know what mistake there was. This is the document.

A. Yes. I recalled, at the time, that there was a mistake in stationing. I got this information from Dr. Louderback.

Q. Later on——

The Court: Pardon me. So I may follow the testimony: He suggested there might be 400 feet. The way I got it from your testimony on that, yesterday, was——

Mr. Tinning: 50 to 100.

The Court: That is what I thought.

The Witness: Yes, from 50 to 100.

Mr. Tinning: Mr. Larson said he thought there was some mix-up in stationing. He did say that at the time.

The Court: I just wanted to follow the testimony. [768]

Mr. Tinning: Q. On the east end, it was true that the locations, as you drove east through the

(Testimony of Lewis Michael Larson.)

cherts and passed out into the lavas—that the locations which you later encountered—that was about 300 feet west of the location shown on Mr. Hulin's map?

A. I cannot answer that, from memory. I believe that I do have records at Santa Cruz, which are not right now available to me, that will tell me and give a more accurate answer to this.

Q. You said that Dr. Louderback told you there was some mistake in the stationing?

A. I think it was he, yes.

Q. During the time you were constructing the Claremont Tunnel, did you frequently see Dr. Louderback?

A. Quite frequently.

Q. Where? A. In the tunnel.

Q. You called him out there sometimes when you had problems, didn't you?

A. No. His visits were all voluntary.

Q. His visits were all voluntary? A. Yes.

Q. You never called him at night when you had grumblings and rumblings underground in there?

A. I had no recollection of it.

Q. Have you any recollection of times when gas was shaking up the ground and giving you all kinds of trouble in there?

A. I think that was prior to this time when we encountered the cherts. That was in the Chico sandstone.

(Testimony of Lewis Michael Larson.)

Q. I am talking about the whole tunnel. When you were driving through the Chico sandstone, before you got to the chert?

A. When we were driving through the Chico sandstone, we had considerable methane gas; but I don't recall we ever called Dr. Louderback. His visits, I believe, in every case—except he might have been called by the district—were voluntary visits.

Q. In other words, he was out there frequently, and it is your recollection that you never called him, that he came out there to look it over?

A. That is my recollection. [769]

Q. Isn't it true you consulted him as to your problems and what you might require as you drove in?

A. I tried to get him to answer those, but he took a most conservative position, that he could not look into the ground forward; that is my recollection: that the surface or top of it was what he based his information on. I will say this for Dr. Louderback—because it has an important bearing on the confidence I placed in his report: that he was very painstaking in recording what he saw in the Claremont Tunnel.

Q. Were you painstaking in recording what you saw in the Tunnel?

A. Reasonably so, from a construction superintendent's point of view; I should say, unusually so.

Q. You made a report on what you saw in the

(Testimony of Lewis Michael Larson.)

tunnel to Dr. Louderback after you got through, didn't you?

A. I did; at his request, yes.

The Court: We will take a recess for a few minutes.

(Recess)

Mr. Tinning: Q. I will show you a document, which I think is an original document.

A. That is my signature.

Q. That is your signature?

A. Yes.

Q. It is a letter addressed to Professor George T. Louderback, University of California, Berkeley, California, February 26, 1929. Now, on our understanding, gentlemen, I assume it will be satisfactory to use a photostat copy, instead of introducing the original letter?

Mr. Smith: No objection.

Mr. Tinning: If the Court please, we offer as Defendant's Exhibit "E," the letter written by Mr. L. M. Larson, to Professor Louderback, on February 26, 1929,—a report of conditions and methods used by Mr. Larson in driving the Claremont Tunnel.

The Court: It will be admitted and marked. [770]

(The letter was marked "Defendant's Exhibit E.")

[Set forth in the Book of Exhibits at page 349.]

(Testimony of Lewis Michael Larson.)

Mr. Tinning: Q. Mr. Larson, taking this letter up, section by section, I will read as follows:

"My dear Professor: In the following summary of conditions and methods used in meeting them, in the excavation of the Claremont Tunnel, I have endeavored to give station numbers where I had such in my possession; otherwise, set numbers."

I assume by "set numbers," you are referring to the timber sets?

A. Yes. We numbered each individual set, as it was placed.

Q. And, as we have already discovered, from looking at the Hulin map,—the Hulin geology map, which is attached to Exhibit "D,"—the stations started to the east on this tunnel; that is, over at San Pablo Creek, and ran toward Oakland; and you were driving from Oakland towards San Pablo Creek?

A. That is correct.

Q. So, there is usually a subtraction involved in trying to get coordinated with the stations shown on the Hulin map? A. Yes.

Q. Reading further:

"It has appeared to me to be better for me to follow the order of progress rather than that of stationing, although that involves working against the station numbering.

"We encountered a small amount of water

(Testimony of Lewis Michael Larson.)

after penetrating about 20 feet from the west portal, but the ground was firm enough to avoid spile driving or breastboarding."

In other words, you did not have great difficulty getting underground in the initial step; that is what that refers to?

A. Not unusual difficulty.

Q. "At approximately 100 feet in, as I now recall it, we encountered the formation noted in Mr. Hulin's report as silica-carbonate rock. This was blocky, overbreaking in many cases, considerable."

You have a copy of this map in your hand?

A. Yes. [771]

Mr. Tinning: Your Honor, it may be a little helpful, and illustrating matters that we are going to refer to, to have before you the map that is attached to Defendant's Exhibit "D,"—the Hulin geology map.

Q. The formation referred to in this portion of that letter was the Chico sandstone, was it not?

A. My recollection is that was the Chico sandstone which began at 171 plus 50, didn't it?

Q. Well, in other words, it began, as shown on this map, at 171 plus 60?

A. Yes.

Q. You state that, when you were about 100 feet in, you encountered silica-carbonate rock?

(Testimony of Lewis Michael Larson.)

A. I think that was what we termed the Franciscan.

Q. That is what you referred to yesterday as the first formation? A. Yes.

Q. "At a distance in of approximately 700 feet, sand and well-rounded gravel, the latter of a probable maximum dimension of approximately 3 inches, was encountered, carrying some water, probably about 40 gallons per minute."

Is this sand that you refer to there the stream bed you said yesterday you had encountered?

A. Yes.

Q. That was in this area shown as the Chico sandstone? A. Yes.

Q. On this map, that is the second section running from 171 plus 50 to 118?

A. Yes. Let me comment here: that that is in that territory that Professor Hulin says was so covered with improvements that he could not make an accurate survey.

Q. Yes. You made, at that time, no objection or claim that you were misled by the geology report in that he had not predicted this?

A. No; we did not make any such claim.

Q. "No shooting was done in this formation, which extended for approximately 165 feet. There was some clay in the sand, and gravel [772] content; but the standing condition was

(Testimony of Lewis Michael Larson.)

favored by an overlying strata of almost pure clay that almost followed to line of top of cap."

Do I understand that there was a clay bed above the gravel which happened to lie just about on the line of the top of your timbers?

A. Yes; that is the correct interpretation.

Q. So, while the gravels were loose, and you could take them out with tools, without using powder, that is a tight material above that did not cave?

A. Yes; that favored our progress.

Q. "When we passed through this, we encountered about 20 feet of a rather easy-breaking, reddish rock that required light blasting, but offered no unusual difficulties.

"The contact beyond this formation was a sort of 'gumbo' that mined easily and stood well for a short period, when swelling began and it was necessary to relieve pressures wherever possible to prevent breaking of the timber."

That was in this Chico formation, was it not?

A. Yes.

Q. And it was not in any place where Dr. Hulin predicted you were going to find swelling ground?

A. It was in the portion where he said he had not made a study of the conditions because of the improvements.

Q. "In some cases this corrective was not sufficient, and retimbering had to be done intermittently for about 80 or 100 feet."

(Testimony of Lewis Michael Larson.)

In other words, you had timbers that broke, and you had to relieve them, by putting in other timbers between them, did you not?

A. That is the correct interpretation.

Q. "This heavy, constant pressure gradually lessened as we proceeded with our excavation up to Station 164."

Station 164 would take you about one-third of the way through the Chico sandstone,—the second formation shown on the map?

A. No; [773] 164 would be hardly penetrating——

Q. I am using the wrong method, again. It would be about how many feet into the Chico?

A. Well, let me see—from 72 to 60—between 77 and 62—800 feet—wouldn't it be?

Q. About 800 feet in? When you say from 72 to 84, you mean from 172 to 184?

Mr. Smith: To 164.

Mr. Tinning: Q. Well, you had to retimber—and, by the way, do you recollect whether you had to carry the timbers in this portion of the tunnel,—the second design as shown in the District's plan; the circular design?

A. We did not.

Q. You were able to hold it by a U-shaped plan and two vertical posts?

A. Yes; a five-segment arch.

Q. Were those posts vertical or battered?

(Testimony of Lewis Michael Larson.)

A. Vertical, yes. I might mention, there: when I became superintendent, I offered a suggested change to the District, which changed the posts from an inclined post to a vertical post, and allowed the position of the cap to be in a horizontal position at the top, instead of divided; and it was easier to construct it,—that is, the division should not be made at the center; and the District accepted my design.

Q. They permitted you to use that?

A. Yes; and they changed their own design.

Q. "At that point— "You are referring to station 164—

> "we encountered better standing ground, that offered no unusual difficulties. Slight quantities of water were encountered at intervals up to about Station 160, where the shale began to show the presence of gas in small quantities. The gas increased slightly as we proceeded forward, being most noticeable where the shale formation was broken with soft sandstone carrying a small quantity of water.
>
> "The shale worked easily and stood well for a short period, [774] giving us time to erect 6-foot sets after mucking out, the spiling was placed immediately after shooting.
>
> "At Set 636, a run of small particles of comparatively clean sandstone, forced out by a quantity of water sufficient to flood the tunnel to a depth of a foot for a distance of several hundred feet occurred at the end of the spiling

(Testimony of Lewis Michael Larson.)

just as preparations were being made to erect the set. About three hours thereafter there was a gas explosion that injured a number of workmen. It appears that the gas ignited as it was entering the tunnel, because the flames concentrated about the point from which the run came, and appeared to have pressure behind it."

How many men were injured in that accident?

A. Twelve. [775]

Q. There was an accident in the eastern part of the tunnel in the cherts where there were some ten or eleven men killed, was there not?

A. That was a matter of drowning. The people that were driving the Lafayette Tunnel had it bulkheaded effectively against the entry of San Pablo Creek coming into the excavation; an unusual storm came, I think the heavy storm recorded came on Thanksgiving Day and it exceeded any amount that had ever flown before in San Pablo Creek, and it proved that the barricade erected by Smith Bros., who were the contractors on the Lafayette Tunnel, was not sufficient to hold that tremendous amount of water, and it flowed into the screening chamber that separated the two tunnels and then flowed into the Claremont Tunnel; the workmen had just had their Thanksgiving dinner and were just going to work, and when this big flow of water struck them, but that was a condition that was outside of the expected or controllable features of this work.

(Testimony of Lewis Michael Larson.)

Q. As a matter of fact, as long as you have gone into it regarding the state of the flood, it was the contention made and the evidence established the fact that a similar quantity of water had flowed in San Pablo Creek before, and that there was an open adit from the east end of the Claremont Tunnel on the bank of San Pablo Creek above this station, and that the water raised and went into that soft earthy material and went into the tunnel and flooded it. I am not trying to blame anyone.

A. I think that is substantially correct. The tunnel was open at the end at the request of the engineers, so that they could back sight.

Q. Now, coming back to the Chico sandstone:

> "From that point forward gas and water appeared together when the disintegrated sandstone was encountered, though in lesser quantities. A year or [776] so after having passed through this formation weight began to show in the vicinity of sets 330 to 345 and 562 to 586, 619 to 634, 816 to 823, 984 to 1002. Relieving sets were erected to hold the ground."

Now, in the Claremont Tunnel apparently the area that you referred to in this Chico sandstone stood under the original timber about a year before strains and stresses began to be indicated: is that correct?

A. If I recall correctly there were no unusual stresses noted in the Chico sandstone formation. I

(Testimony of Lewis Michael Larson.)

would have to refer to these sets to know just where they are. It may be that some of them were there, but the important fact is to say that it did stand for a year without lining.

Q. Without the permanent concrete lining?

A. Without the permanent concrete lining, yes.

Q. At the end of the year it was beginning near these various points to show strains and stresses?

A. Yes.

Q. As indicated by your report?

A. Yes, where indicated by the report.

Q. This was in the Chico sandstone formation because, if you will note the next paragraph of your letter carries you from the Chico sandstone, as you drive east into the cherts.

A. Yes.

Q. "At station 123 plus 31 to 121 plus 91, from whence we merged from the Chico sandstone section, as noted by Mr. Hulin, to the chert, concrete invert and arch were poured to take care of a ground swell and consequent weight, and to act as a deterrent to a spread of fire if oil were encountered in the cherts."

Do I understand from that, Mr. Larson, that you emerged or passed from the Chico sandstone through the Wildcat Fault and into cherts at station 121 plus 91?

A. That would apparently be the proper interpretation; it was either that or we were right ad-

jacent to [777] it. My memory is not too clear on that.

Q. You would not think if the construction record of the District shows it passed into the cherts at 121 plus 87 that either of you were very far wrong?

A. No, this was approximately where that error in station occurred. I am just assuming that, knowing that there was one.

Q. You are assuming that, but you cannot explain why it was? You have not that knowledge?

A. No, I have not that knowledge.

Q. According to Mr. Hulin's map, the point which in your own letter to Dr. Louderback you give as station 121 plus 91, that was about 400 feet, 391 feet from the point where Mr. Hulin predicted it would occur. Yesterday you testified that before you passed from the Chico sandstone into the cherts you installed about 175 feet of concrete lining as fire break. Your letter, you will note, states, "To take care of a ground swell and consequent weight."

As a matter of fact, you were having considerable difficulty going through that section, weren't you, before you got into the cherts?

A. No, we were not.

Q. You were not?

A. No. That was a secondary consideration. That was one of the reasons, or the first reason, and the real, the only reason for putting that in was in anticipation of encountering possible oil or gas that would light a fire and allow that to come back, be-

(Testimony of Chad F. Calhoun.)

cause we had many places much worse than this where we did not concrete.

Q. You say it was a secondary consideration, but it appears in your letter as a chief consideration, does it not, ground swell and consequent weight?

A. Yes. I am giving you that as a real reason.

Q. "We have made it a plan to stop excavation and pour invert whenever water of sufficient quantity was encountered to make track maintenance and train operation difficult. As a consequence, the [778] invert was concreted to station 121 plus 91, when we attacked the main body of the chert."

Now, in addition to ground swell mentioned in the preceding paragraph and consequent weight, you apparently had experienced a considerable quantity of water at this point?

A. At the time we placed this concrete I believe that the water was less than 10 gallons per minute, practically dry, but we had information from the Hulin report, I believe you will note, that we might expect to find it. I do not know whether it refers to water in the cherts, maybe it does not, but we did expect to find possible gas and oil, and that is the reason for placing this circumferential concrete lining and, of course, at the same time, we would naturally place our inverts; that would give us better operating facilities.

Q. You could not place your concrete lining without placing your inverts, too, could you?

(Testimony of Lewis Michael Larson.)

A. Not a complete one, no.

Q. So that the invert was part of the concrete lining at that point?

A. The procedure we followed was to place the invert first and then pour the lining.

Q. "When excavation was resumed at the last-named Station"—at 121-plus 91, the point where you attacked the main body of the chert—

> "we began to feel pressure on our right. We had proceeded about 24 feet when the pressure became so great that relieving sets were erected to support regular four-foot sets. Suddenly water broke out alongside in a quantity of probably 200 gallons per minute, and the pressure was relieved."

Now, in this area which I think you referred to yesterday as being the section of about 120 feet when you emerged from the Chico sandstone going into the cherts you said you had a difficult time.

A. That is my recollection. [779]

Q. You had broken, loose shale, considerable quantities of water running, requiring breastboarding and spiling. A. Yes.

Q. "At Set 1039 we encountered a large flow in a badly broken chert formation. For a few hours our pumps, having a rated capacity of 800 gallons"—that means 800 gallons per minute, I assume?

A. It does.

(Testimony of Lewis Michael Larson.)

Q. "—could not handle it. The s reduced in quantity to 580 gallons within seven hours, when the reduction apparently ceased. It was necessary to drive spiling and erect breastboards from this set to set 1052."

That would be from set 1039 to 1052, and at 4 feet apart how far would that be?

Mr. Smith: Were they at 4 or 6-foot centers?

A. I am not sure whether they were 4 or 6.

Mr. Tinning: Q. You said in the preceding paragraph you were setting them at 4 feet.

A. I did in that section, but I am not sure it was here, but even assuming it was 4 feet, 39 from 52 would be about 13, would it not?

Q. And four times 13?

A. It would be 52.

Q. 52 feet? A. Yes.

Q. So that if that was 4-foot centers it would be 52 feet.

Mr. Smith: It depends on the centers.

Mr. Tinning: The preceding paragraph, in talking about the same section— I am trying to see what we can get there in definite form in this matter as to this section, because, as you state at the beginning of your letter, it makes it somewhat difficult to tie in with stations.

A. I think possibly to make it clear I should say that most of the spacing of the sets was 6 feet, that was general.

(Testimony of Chad F. Calhoun.)

Q. But your letter says in going through this section you placed them in four-foot centers.

A. Yes.

Q. After you got into the cherts.

A. Yes. I might not have [780] carried it through the faulted section at 4 feet, I am not clear on that.

Q. You also in this faulted zone had to place relieving sets. "At Set 1039 we encountered a large flow in a badly broken chert formation." You remember Mr. Hulin's report where he said you might expect water in the lava. "For a few hours our pumps, having a rated capacity of 800 gallons, could not handle it. This reduced in quantity to 580 gallons within seven hours, when the reduction apparently ceased. It was necessary to drive spiling and erect breastboards from this set to set 1052, when the chert showed a tendency to stiffen.

"Blasting was permissible then to set 1054." Now, when you were coming up to set 1052 wasn't blasting necessary?

A. I would imagine not, from the fact that I do not mention it.

Q. Wouldn't it also be, where you were spiling, you would have such loose material that you had to place relieving sets that you might not require blasting?

A. That would be my conclusion.

Q. In other words, you could pull this stuff out from behind the breastboards and it would run out like loose gravel or loose rock?

(Testimony of Lewis Michael Larson.)

A. With the water contents I think that would be true. I think we drove spiling in that area.

Q. Doesn't the letter say you drove spiling?

A. Yes.

Q. In the preceding paragraph I just read?

A. We drove the spiling and breastboarding.

Q. And you had running material?

A. Which would indicate we did not use powder.

Q. Then we come back to the letter,

"Blasting was permissible then to set 1054, when we again encountered water and badly broken chert, forcing us to again resort to spile driving and breastboarding. At set 1064 we again reached firmer ground, which permitted [781] blasting, until set 1065 was reached,"—that is one set—"when a further addition of water and bad ground forced spile driving again. At set 1069 we appeared to have found better going, though we had later on to erect spiling before blasting the lower part of the face. This condition prevailed until the point of set 1085 was reached. From there on until the chert was passed the ground progressively stiffened, and some heavy blasting was necessary to break the vertical chert. Timbering was spaced up to a distance of 12 feet between sets, where ground was standing well. At sets 1136 to 1139 we later had to erect two relieving sets. Generally speaking, this vertical chert did not take weight after we passed through it."

(Testimony of Lewis Michael Larson.)

Isn't it a fact that through about the first half of the chert area of 1,000 feet that you had variable material, you had about 120 feet when you passed through the fault, where you had to use breast-boarding, spiling, and you had flowing water in that first 120 feet practically throughout all of it?

A. I would have to check up on station numbers to give you a definite reply to that, Mr. Tinning. I think the important point, though, in this is to state that in spite of all these apparent difficulties the cost of the job was below my estimate, and that estimate was based on the geological report and specifications.

Mr. Tinning: We will ask that that go out as not responsive.

The Court: It may go out.

Mr. Tinning: Mr. Larson, I am interested in the condition that you actually found there and I will give you some of the station numbers and ask you if you can remember from these construction records or by notes which you have as to what was actually encountered in that chert? Now, this tunnel that you were making was not very much larger than one of the wall plate drifts of the [782] Broadway Low Level Tunnel, was it?

A. It was about 12 by 12, not much larger than that lower drift.

Q. About that size, and you had timbers in there, 12 by 12 timbers, did you not?

(Testimony of Lewis Michael Larson.)

A. In the Claremont, I did in the Broadway Tunnel.

Q. I did not ask you what you had in the Broadway Tunnel, I asked you, Mr. Larson, what timbers you had in the Claremont Tunnel.

A. 8 by 12.

Q. 8 by 12? A. Yes.

Q. And some 8 by 12 timbers were shattered and crushed at various places in this tunnel and as you passed through the broken portions of the various formations?

A. Yes, in some cases.

Q. In a 12-foot excavation? A. That is true.

Q. Do you remember, Mr. Larson, that at Station 120 plus 63, which was in the Chico sandstone, just before you entered the fault, a cave occurred in a material that was a mixture of sandstone and rotten cherts which required the excavation to be shut down and new pumps installed, and you there had to breastboard the surface of the tunnel as you drove into this rotted and shattered cherts?

A. I believe that is a mistake.

Q. You think that is a mistake?

A. I think that is. I think you will find you are reciting a condition at about station 86.

Q. You think that that is a mistake in the record?

A. I think that is a mistake.

(Testimony of Lewis Michael Larson.)

Q. We won't pursue it further if you think it is a mistake. Now, we are coming eastward from station 120 plus 53 to 119 plus 86. The District record shows that cherts was badly shattered, with occasional layers of sandstone, much water, heavy timbering was required, and that the timbers were set back 12 inches so that you got a much heavier lining, as the specifications permitted the [783] District Engineer to order. Now, this was in the fault area.

A. We are getting mixed. That was still following up on this enlarged section, and in an area that was possibly two or at least 1,000 feet away from there.

Q. You remember that you passed into the cherts, according to your own letter, at 121 plus 92?

A. Yes.

The Court: What is the distance across that cherts formation?

Mr. Tinning: About 1000 feet. Now, 121 plus 92 is out here. A. Out here.

Q. Now, I am talking to you about a station further east than that, 120 plus 63. You said you thought I was mixed up. What did you mean?

A. I am very confident you are. I think you are talking about the thing that occurred about station 86.

Q. I am coming to station 86 later on.

A. I have no recollection of what you are mentioning here.

(Testimony of Lewis Michael Larson.)

Q. Station 86 was in the Orindan?

A. Station 86 would be where we ran from the Orindan into the lava.

Q. Yes. I will come to that later on.

A. But I have no recollection——

Q. You have no recollection of the requirement of widening or thickening the concrete in the very place that you installed this concrete before you passed into the cherts?

A. I can feel perfectly safe in saying it is a mistake.

Q. It is a mistake? A. Yes.

Q. Would you say that from station 120 plus 63 to 119 plus 86 the cherts was not badly shattered?

A. 120 plus 63 to 119 plus 86.

The Court: Keep in mind you are reading from the report there.

Mr. Tinning: No, I am not. I am reading from a document which he said was a report of the East Bay Municipal Utilities. [784]

The Court: I just wanted to have the witness know; I was mistaken; I didn't know whether it was or not. I wanted to clear it up.

Mr. Tinning: I am sorry I did not make it clear. I am referring to some construction records of which I have notes and asking him from his recollection.

A. I think that was in the fault zone; I take it so from the information that has been given by my letter to Dr. Louderback, that the fault zone was

(Testimony of Lewis Michael Larson.)

farther west than indicated in the Hulin report, and now you are speaking of the fault zone, and I think that was pretty well crushed.

Q. I did not make it clear in my question so that you know what area we are in. That is the area of heavy timbering and it was a fact that the timber was set back so that there was a 12-inch extra thickness of lining placed there.

A. That I don't recall.

Q. You don't recall?

A. I don't recall that.

Q. You would not say that that had not been done? You have in mind the place of great difficulty around Station 84 where you did have to put in a 24-inch lining. Is that the only place you thickened the lining?

A. No, there was another place where we ran into 40 feet of heavy swelling ground and it might be that this was the particular distance, but I had in mind a location that was different, we had to set the timbers back in that we had to put in relieving crews—just to illustrate, to make it clear, I had been told that in the San Pablo Tunnel that same material effectually closed and absolutely closed the tunnel three times. In this particular place I put in what we term full circle sets—I think that is what you are referring to—but the timbers there protected, on account of the swelling of the ground, and I put on relieving crews, that is to keep digging the [785] ground back away from the timber to prevent the breakage, and then later on enlarged the

(Testimony of Lewis Michael Larson.)

section, and the swelling was so rapid that I had to pour the concrete in smaller sections there.

Q. 6-foot sections placed by hand?

A. Something like that, yes, and pour the caves, as it would have the effect of shutting off the air and taking up the compression before it raised itself against the pressure placed concrete, and that probably is the section we are talking about now. We did encounter one there now of 40 feet, as I recall it.

Q. Don't you remember that that section that you just referred to so graphically was over 84?

A. I do not recall it.

Q. In the Orindan? A. In the Orindan.

Q. Where you had water in the Orindan?

A. I would be reasonably sure to say no, not in the Orindan.

Q. Not in the Orindan?

A. I am very sure my memory is correct on that. You see, we are now in the Chico sandstone, just leaving the Chico sandstone, and we have not run into the Orindan yet.

The Court: We will take a recess now until two o'clock.

(A recess was here taken until two o'clock p. m.) [786]

(Testimony of Lewis Michael Larson.)

Afternoon Session,

Wednesday, April 20, 1938;

2 O'Clock P. M.

LEWIS MICHAEL LARSON

Cross Examination (Continued)

Mr. Tinning: Q. Mr. Larson, I understood you to say, just before the noon recess, that the majority of the timbers used in the Claremont Tunnel was 10 by 12 in the cross-section? A. 8 by 12.

Q. 8 by 12? A. Yes.

Q. And, to pursue that further: In some places where you had heavy ground, did you use heavier timbers?

A. I believe, in the two portals of the tunnel—not the two portals; but, on one portal of the tunnel, I started in with 12 by 12, and then I went to 10 by 10 for a distance, and then went to 8 by 12.

Q. Through the Chico and Franciscan, as you went in from the west?

A. I think most of the Chico, I believe was 8 by 12. The Franciscan was 10 by 10,—most of it; and the cherts and the Orindan, 8 by 12.

Q. And the lava? A. 8 by 12.

Q. In these places of heavy pressure that we have been discussing, did you use 12 by 12?

A. Not that I recall.

Q. So far as you know, there were no 12 by 12 timbers in there?

(Testimony of Lewis Michael Larson.)

A. So far as I remember, there was none.

Q. Have you still the copy of your letter to Dr. Louderback? A. Yes, sir.

Q. We have concluded reading to the bottom of page 2 of that letter, and we had diverged to a discussion of some of the stations where there were some pressures and heavy ground, and the difficulties encountered. Coming back to the letter:

> "Very little oil was found in the chert, and such as was observed was more apparent in the slippery sand following the water, [787] which generally showed in the broken formation as we approached nearer the firmer chert."

Now, isn't it a fact, Mr. Larson, that in the first 500 or 550 feet of the chert which you encountered, as you drove from the west toward the east, that, on numerous occasions, you encountered running ground?

A. I have not any direct recollection of that, Mr. Tinning.

The Court: What do you mean by "running ground"?

Mr. Tinning: By that, I mean ground that required breastboarding.

The Court: Very well.

Mr. Tinning: And broken small particles of crushed chert or shale.

A. It is my recollection that those portions, such as there were, were interspersed between firmer chert parts.

(Testimony of Lewis Michael Larson.)

Q. I did not mean to indicate that, throughout the 550 feet, you drove through broken material.

A. No.

Q. As I understand your testimony, approximately 120 feet of the distance after you entered the chert was in broken material; you had considerable difficulty for that 120 feet, and then, I suppose, there may have been some strata that were firmer and not broken?

A. Yes. Those were the things that registered on my memory.

Q. But after you left that 120 feet that you described here yesterday, and came back in the remaining distance of approximately 380 or 400 feet further east from the first 120 feet, you did have interspersed between the firmer layers of chert, the solid, brittle, hard cherts, that area where you had running ground and considerable water?

A. I believe the "considerable water" would be an exaggeration. I don't recall that we struck any considerable amount of water after we left the major formation. Whether there was running [788] material—I would have to refresh my mind entirely, from the letter. It has not been sufficiently registered on my memory that I retained it, because it seems to me that we got through that part and our troubles were fairly easy in the chert section.

Q. The reference that was made, on the preceding page, to sets does not assist you, to refresh your memory?

(Testimony of Lewis Michael Larson.)

A. I would have to check up the spacing of sets, in order for it to be of any value. If you have about 4 feet in the background, it is different than if you had 6 feet, naturally.

Q. Whether it was 4 or 6, it is your recollection, is it not, that, through the first half of that chert, you frequently ran upon lenses or fissures in the solid material in which you found running, broken ground?

A. I would have to reread it more particularly in detail, in order to answer you the question as you have given it to me. I am inclined to think there was probably less; that is the impression that was created: would have probably been less rather than as great——

Q. Well, my question is a general question: That the texture of the material was varying in the first half of that chert? A. It may have been.

Q. Now, we will go over to page 3; and we have read the first paragraph. You state:

> "Leaving the chert, we entered the Orindan, which was very firm and hard to break, as was the cemented gravel that frequently appeared. These materials gradually grew softer as we left the chert behind and approached the lava. Most of the oil and oil-gas we encountered was found on the contact of the Orindan with the cemented gravel. As we approached nearer the lava, the gas decreased and the gravel increased, with water dripping in increasing amount. The

(Testimony of Lewis Michael Larson.)

> Orindan section generally stood well under 6-foot timber spacing, but broke blocky and did not muck well. One muckerman expressed it [789] that 'it was like mucking wool!' "

Q. What did you mean by that?

A. I think it had recementing qualities in it that, when it came in contact with water, the tendency to cement itself into a firmer texture would be present. I think the expression that he used,—the muckerman's expression—the mucker operator expressed it as "mucking wool"—that was his expression.

Q. Do you mean it was resilient?

A. Well, it would tend to fall and break harder in the firmer condition than when it first fell.

> Q. "When it was apparent we were approaching near to the lavas and water began to show evidence of decided increase, we discontinued excavation long enough to bring our concrete invert to the then face."

I suppose that that portion of your letter refers to what you stated earlier: that you put in the invert to carry the water to prevent having wet ground upon which you had to lay your tracks?

A. That was the uniform procedure.

Q. I assume, when you came to the contact between the two formations,—the Orindan and the lava,—that you again encountered considerable quantities of water?

(Testimony of Lewis Michael Larson.)

A. Well, my recollection is: Hulin's report stated we would; and I prepared to meet that condition.

Q. I am referring to the geological map here, in back of the Hulin report: Mr. Larson, the Orindan you described in the paragraph of the letter which has just been read, was the Orindan which is shown on this map,—this geology map attached to Defendant's Exhibit "D",—as the aerial line immediately east of the chert, commencing at Station 108, as shown on this map, and running over to approximately Station 88?

A. That is true. That is the part I had in mind.

Q. What you call "lava"—will you tell me what you call "lava," [790] where you see it on this map?

A. Yes. It is indicated by this line, where the broken—the dotted lines end; and we have a solid line.

Q. There is a distance there of approximately 100 feet? A. Yes.

Q. Shown on this map, longitudinally?

A. Yes.

Q. I was led to believe, from looking at the legend below, that that might be a limestone there.

A. I rather think it was; and I mounted drifters,—they are heavier air drilling machines.

Q. You used those, in passing through this area of limestone which lay immediately to the east of the first strata of Orindan which you encountered?

A. That is true.

(Testimony of Lewis Michael Larson.)

Q. What is the next material that you encountered which seems to be coming off to apex or peak just east of the limestone?

A. The interpretation I received at that time was that that was a volcanic ash. That is where we encountered the major portion of our water in the lava formation. We drove into that in the shot,—the last shot where we used a drifter, which enlarged that hole by about one foot; and the pressure of water and the material broke open the face progressively.

Q. You mean it opened it up?

A. Yes; it broke through the formation,—created hydrostatic pressure and broke through.

Q. Broke through the last part of the limestone that was in the face—— A. Yes.

Q. After you passed through what you call "volcanic ash," what material——

A. Then we ran into the real lava, as indicated by the Hulin report. That continued up to the Pinole Fault.

Q. On this map, doesn't the legend indicate what you call the "volcanic ash" is a conglomerate Moraga formation?

A. That is what is noted on the map. I received the interpretation,—whether it was from Dr. Louderback or other sources,—that it was really a [791] volcanic ash. Whether that interpretation was correct, I never ascertained.

Q. In this tunnel, at some point you had a place where there was 50 or 60 feet of limestone between the volcanic ash?

(Testimony of Lewis Michael Larson.)

A. That is this point we are discussing now.

Q. That is the point where you passed around Station 187? A. No; Station 87.

Q. Station 87?

A. As indicated on this map.

Q. Then you passed through the lava, and you again passed through what is designated here as "conglomerate Moraga formation," and which you say you considered was volcanic ash?

A. I did. Referring to the volcanic ash on that end, I find that to be the result of a pulverizing of this vertical uplift of the east end of the Pinole Fault,—that section that formed the fault. That was my conclusion.

Q. Then you drove beyond the Pinole Fault,—what you call the Pinole Fault; so designated on this map. You were back into the limestone and through that, into the Orindan, again?

A. The limestone, I don't remember. It was probably in the pulverized section. I don't remember driving the same formation on leaving the lava as I did on entering. The line of demarcation between what I believed then to be the lava and the Orindan was very marked.

Q. It came out of it sharply?

A. Very sharply.

Q. Within how many feet, would you say?

A. I think, on a cross-section from the east side to the west side of the tunnel, it would not vary, I

(Testimony of Lewis Michael Larson.)

believe, more than 2 feet. That is my recollection now; but the line was very, very clear.

Q. An abrupt transition from one end to the other? A. Yes. [792]

Q. "On resuming mining, our second shot brought us into the lava. The contact was reasonably soft, but the ground stiffened to such an extent that we found it advisable to discontinue the use of jack hammers and proceed with Leyners. The ground drilled well and broke well, and, though containing some water, gave promise of continuing Leyner ground. At station about 89 plus 00 one of the shots in the right breast penetrated a volcanic ash deposit lying in a sufficiently loose state with a large amount of water, that within three hours the face had broken in against our efforts to hold it and the ash, accompanied with a flow of 1400 gallons of water per minute, partly filled the tunnel for a distance of 60 feet before a sufficient bulkhead to hold it could be erected. The pressure exerted longitudinally forced collar braces from 1½ inches to complete penetration of some of the 8 by 12 timbers. The ash surrounded the sets so that none of them were completely knocked down.

"We dropped back to station 94 plus 08 to 94 plus 40"——

(Testimony of Lewis Michael Larson.)

What do you mean by that, Mr. Larson, do you mean that you receded by reason of the intrusion of the ash in the tunnel?

A. The amount of water was so great that it seemed to be an economical procedure to delay trying to force an entrance in through this volcanic ash area until the water in volume receded, and it was at that period of stopping that I dropped back to put this concrete in that we are now coming to, because it was, in my mind, an economical and proper procedure.

Q. This station at 94 plus 08 was in the Orindan, was it not? A. Apparently it was.

Q. And it was how far east of the point where you had encountered this hard rock—just refer to your letter again, you said at 89 plus 00 one of the shots in the right breast penetrated a vol- [793] canic ash, and water came in with the ash—that would be 500 feet west, would it not, 89 plus 0—that would be 500 feet back into the Orindan?

A. Yes.

Q. "Where we had encountered a very heavy swelling ground and had found full circle sets at two-foot spacing, constantly relieved, not holding the ground, and concreted this section"—you had encountered that same condition driving through the Orindan some hundred feet before you came to this contact between the Orindan and the limestone or lava, whichever you wish to call it? A. Yes.

(Testimony of Lewis Michael Larson.)

Q. And during the time that you were driving forward you had noticed this swelling ground?

A. That is true.

Q. And in that area you had to place full circle timbers? A. I did all that.

Q. To hold the ground?

A. Yes, I thought I would hold the ground that way.

Q. Was that the place where you had to put in straw? A. Yes.

Q. That is where the ground came squeezing out like dough, like putty, into the section from the bottom, and sides, and every direction?

A. That is correct.

Q. That was in the Orindan?

A. That was in the Orindan.

Q. You concreted this section while waiting stability of the volcanic ash—that is the next portion of the paragraph, so that the concrete lining was 24 inches thick instead of 12?

A. I think it was of that thickness.

Q. And that lining was installed because of the heavy pressure found in the ground at that point in the Orindan? A. It was.

Q. And finishing that sentence: "hoping in the meantime that water pressure would reduce." I suppose the quantity refers to the water pressure?

A. Yes.

Q. Or the quantity of water?

A. Yes. [794]

(Testimony of Lewis Michael Larson.)

Q. "The quantity dropped to 900 gallons, and it appeared that it might be cut off from the main tunnel by a short drift to our right, which then appeared the direction of the supply. This drift materially relieved the pressure at the face for a few feet, and allowed us to excavate the ash to our former face without much difficulty."

In other words, the flow of water was so great that you drove off to one side of the tunnel a drift to intercept the flow and divert it from the face?

A. That seemed the economical thing to do first, to drift and take the water through that adit, as you term it.

Q. Both economical, and it also was of assistance in proceeding with the driving through this ash, was it not?

A. That is true.

Q. "However, when we erected our breastboards and began to press forward we found the main water supply was coming from a point forward and apparently in the line of bore. As we drove our spiling, each one a couple of inches, until a penetration of six to eight feet was accomplished, we attempted to open a small hole in the breastboard at the last set and advance a new one four feet ahead."

As I understand you, you had at the base of the tunnel a breastboard or bulkhead the ends of which

(Testimony of Lewis Michael Larson.)

were supported against the last set, timber set that you had in there, either against the last timber set or against the stulls in back of some other set?

A. I do not recall that, but it was a solid breastboard.

Q. And made as near watertight as you could get it? A. Yes.

Q. And when you tried to open a small hole in the breastboard, I suppose you worked through that and removed some of the material behind it and advanced a new breastboard four feet ahead, and you found great difficulty in doing that?

A. That is true.

Q. "This often took hours as the runs of fine ash with an ever-increasing quantity of water made it almost impossibe to make [795] the slightest opening in our former breastboarding. We gradually advanced a small board on the end of a stull to a point four feet distant. This was our most difficult feat and the new breastboard, however small, would aid in stiffening the new face. The next board, also advanced at the end of the stull, was then placed, after many attempts, each stull being nailed to the cap of the last set."

You mean by that that you had a bar or a beam that ran back to the top of the timber ring, pressing against the stull which had been put in and pressing against the breastboard which had been advanced through a hole in the breastboard?

(Testimony of Lewis Michael Larson.)

A. Yes.

Q. It took many attempts to accomplish this?

A. Yes.

Q. "When two feet of new breast was well boarded"—and by two feet I assume you mean up?

A. From the cap downward.

Q. From the cap down? A. Yes.

Q. "The new breastboards were put in at an elevation lower than the old breastboard four feet back so that the fine material could not flow out during the placing of the new board."

A. Let me correct a statement there. I said from the cap downward. We had driven our spiling in advance and there was no cap. It was from the spiling downward.

Q. In the driving of the spiling you said a few lines back, two inches at a time. Does that mean that you were able to advance two inches at a time, or that it was two inches broad?

A. No, as I recall it this spiling, we would drive this one two inches and this one two inches, and so on all around the arch ring.

Q. And it also included the sides of the tunnel?

A. Yes.

Q. So that you had a barrel-like structure of spiling? A. That is correct.

Q. And made it as tight as you were able to get it? A. Yes.

Q. "During all of this time we had run after run of fine material, [796] that it took all

(Testimony of Lewis Michael Larson.)

our efforts to check, though the total losses were never enough to cause much of a void overhead, or permit a sudden drop of material. When the new breastboard was completed two feet down, one or the other of us would creep over the old breastboard and place the next lower new board. This sometimes resulted in hasty retreats and near strangulation as the runs and water attempted to engulf its intended victim; and on at least one occasion emergency pull by the remainder of the men present saved burial."

In other words, you were working in a soft, wet, loose muddy material at that time, were you?

A. That is true.

Q. And a man had to advance through this hole, in what had been the original breastboard at the face and try to work the breastboard in four feet ahead in that material?

A. The reason for that was that you had to carry your forward breastboard at a lower elevation than the one that was behind it; if you did not the material would swell out and run over.

Q. And run over the top? A. Yes.

Q. You had one wall coming down from the top in the advance breast wall, and you had one coming up from the bottom in the old one?

A. That was a wall coming up from the bottom that had already been placed, that was in place, and we were removing it.

(Testimony of Lewis Michael Larson.)

Q. That was the original breastboard?

A. Yes.

Q. You started taking that off from the top and placing the forward breastboard in from the top and came down with the new breastboard at the plank behind on the old breastboard?

A. That is right.

Q. So that was always higher and formed an edge of the trough that held the muck behind that?

A. Yes.

Q. "After getting through this ash deposit holes were made in the overhead spiling sufficiently large to loosen and cause to run such [797] overlying fine material as was necessary to bring large boulders that showed evidence of being there, down on the top of the spiling to forestall a possible future run and drop of material that might cause a collapse of the timbering and resultant trapping and drowning of the crew. These boulders now rest on the timbering and act as a reinforcement against a drop of others.

"We encountered and ever-increasing quantity of water until 3920 gallons per minute were measured on the weir. As we proceeded we encountered new flows and the area left behind gradually and fairly rapidly decreased."

I do not understand what you mean by the last portion of the sentence.

(Testimony of Lewis Michael Larson.)

A. As we picked up new water the water behind us lessened, although it increased in flow, if it had not decreased behind us then that would have been added all the time to the amount flowing out.

Q. In other words, if you went ahead and kept digging out the water decreased as it flowed out of there and drained that area above?

A. Yes, it lessened behind us as we proceeded to pick up new quantities in front.

Q. So that your maximum quantity of water as you estimated yesterday of 4000 gallons a minute was probably never exceeded?

A. No, I think that was the maximum record on the weir.

Q. "Spile driving and breastboarding were again necessary in broken formations carrying large quantities of water at set 1612 to set 1606, stations 82 plus 92 to 82 plus 82, 82 plus 06 to 81 plus 8175, 80 plus 14 to 79 plus 84, 78 plus 06 to 77 plus 79, 76 plus 28 to 76 plus 01, 74 plus 98 to 74 plus 55, 75 plus 52 to 75 plus 27, 73 plus 25 to 72 plus 74, though at no other point than the one in the vicinity of station 89 plus 00 did we have runs that we found it difficult to control." [798]

Where would the last one of those stations, 72 plus 74, bring us on Mr. Hulin's map?

A. That will still leave us in the lava.

Q. So your troubles that are recited in this para-

(Testimony of Lewis Michael Larson.)

graph all have to do with the problems encountered and conditions and materials met in the lava?

A. That is correct.

Q. "In some of the latter breastboard places we could advance our spiling with coal picks and moils." You mean by "coal picks" that you could drive them in with a sledge hammer?

A. No, by a coal pick, that is a pneumatic pick on which you apply air. The moil is a point that you drive in with a pneumatic hammer.

Q. How was the spiling advanced in the Orinda where you had so much trouble with it?

A. In the Orinda?

Q. Yes, you drove it two inches at a time.

A. That was in the lava, that was in this volcanic ash section. There we used a ram.

Q. Such as you show here in the picture?

A. Yes, suspended by a rope.

Q. "In some of the latter breast board places we could advance our spiling with coal picks and moils, and breast board as we pulled the muck away from the face. At other times we could breast board half way down the face and lightly shoot the toe to make mucking easier.

"In cases where we found enough clay present, the star steel was difficult to free, we found augers worked better."

Star steel is drill steel?

A. It is what is termed a star bit.

(Testimony of Lewis Michael Larson.)

Q. "Track laying under twelve to eighteen inches of water, we found difficult, and all timber and lagging and collar braces had to be tied down to prevent them from floating away and derailing trains. Wedges were a constant menace as their size made them hard to hold and easy to float. When we re-entered the Orindan, we found it reasonably soft and blocky. Very little water and no [799] gas penetrated it."

Did you consider the ground through which the Claremont Tunnel was driven self-supporting?

A. Some of it, yes.

Q. Which portion?

A. A good portion of the cherts I would consider self-supporting. However, I wish to qualify that by saying that when we were driving through it and I did not know the nature of the cherts I thought it was necessary to put these sets that I have mentioned with 12-foot centers, but later on I took them out and adopted 24-foot centers as a protection against fragments falling on the workmen.

Q. Did you lag or crown-bar between the sides?

A. No. I lagged over that portion that would come over the track where men would be working.

Q. In other words, you had a roof of crown bars or lagging above the 12-foot sets that you have referred to? A. Yes, I had lagging above that.

Q. The total excavation in the Claremont Tunnel section was about 12 feet high and 12 feet wide?

A. Approximately.

(Testimony of Lewis Michael Larson.)

Q. And in the drift, wall plate drift that you proposed to construct in the Boardway Low Level Tunnel, what was the size?

A. I think at the bottom probably 10 feet. That is something I have not checked up on lately, running to possibly 3 feet at the top. You see, the wall plate drift slopes in with the arch and at the top would be considerably less in extent than it would be at the bottom.

Q. And the timber used in the Claremont Tunnel was 8 by 12? A. Generally.

Q. Generally? A. Yes.

Q. And in the wall plate drift the timber that you used, that you drove the Broadway Tunnel through, was what size?

A. In the drift, [800] itself, it varied, I think from 8 by 8 to 10 by 10, but when I widened out my wall plate and put in the permanent sets, the wall plates were 14 by 14 and the set timbers were 12 by 12.

Q. Mr. Larson, I was directing my question to the timber you used in driving the wall plate drift before you proceeded with any other part of your work.

A. That was mainly 8 by 10, 10 by 10.

Q. When you returned to the Broadway Low Level Tunnel in August, 1935, you inspected the drift that ran from the east portal—there were three drifts, I think, completely driven through at that time? A. Yes.

(Testimony of Lewis Michael Larson.)

Q. What was the size of those wall plate drifts?

A. I think they were about 10 feet high, that is my recollection now, and at the bottom probably 10 feet wide, and at the top at least four, between four and five feet wide. That is as near as I can recall it now.

Q. What size timbers were used, did you say, in these drifts?

A. I used some 8 by 8, some 10 by 10; I do not recall that there were any 12 by 12.

Q. How far apart were the timbers placed in the wall plate drift that you used in driving the Broadway Tunnel?

A. Was that in the first excavation, or after I put my wall plates in?

Q. The first excavation.

A. In the first excavation I aimed where possible and in most cases did succeed in going a distance of six feet.

Q. Where you put your wall plate later, the place that you referred to in your question to me how far apart?

A. My recollection is that in general the station was 3 foot centers, though in some cases where I anticipated a possible weight I put them closer. I did not use any uniform spacing standard. I tried to meet what was necessary and what would become necessary. There were some cases there where I believe I [801] put in two together and then spaced the next one either two or three feet and put two or

(Testimony of Lewis Michael Larson.)

three more; there was no regularity; as I said, it was entirely in my judgment of what pressures we would have to meet.

Q. What was your reason for placing the timbers in the wall plate drift that you have just been referring to on three-foot centers when previously you had been placing them on six-foot centers?

A. In the first place, the drift was temporary and was smaller in opening than the wall plate in its enlarged section; further, it controls only with one operation, that is, it is supposed to hold the ground on the core to the height of the wall plate drift and the material above it to whatever that may be, which is probably somewhere between 3 to 4 feet, and on the permanent timbers you have to meet that with sufficiently strong supports that extend from one wall plate to the wall plate on the other side, that is, you have to cover several drifts.

Q. Wasn't the reason that you brought your timbers closer together the fact that the drift was a bigger drift than the one where you had them 6 feet apart?

A. No, the primary reason was I would have several drifts tied together to form the ring of the arch, and would not have to confine the strength merely to a small drift, but it would have to be able to transmit the weight of the whole thing onto the timbers.

Q. So that the closer spacing of the timbers was to take care of that weight and also to take care of

(Testimony of Lewis Michael Larson.)

the fact that it had a bigger opening than it had where the drift had the timbers 6 feet apart?

A. That is true.

Q. It was not due to the fact that it was in different ground?

A. The spacing of the timbers and the size of the wall plate was conditioned on the ground. [802]

Q. I am not talking about the timbers now. We are talking about what I might call your temporary drift timbers.

A. No, the temporary drift it appeared, and in most cases I believe it proved that on the 6-foot stations with the timbers that I have mentioned they were ample.

Q. When you inspected the old tunnel and you described the result of your inspection to us you told us that you considered the formation of the cherts disclosed there.

Mr. Smith: Does that question refer to the old highway tunnel?

Mr. Tinning: Yes. There is no mistake in your mind about that, is there, Mr. Larson? A. No.

Q. I am referring to the old tunnel which you said you visited and passed through when you inspected the site early in March, and you saw cherts standing in that tunnel. You subsequently formed an opinion because that material was higher in that formation than the Boardway Low Level Tunnel, that it would not be as good material as you had in the tunnel, and that you could anticipate in the tun-

(Testimony of Lewis Michael Larson.)

nel, because the deeper the material the better the formation.

A. That has been my experience. I based it on observations in my past experience.

Q. The old tunnel stands at an elevation of approximately 1030 feet and the Broadway Tunnel at an average elevation of approximately 800 feet?

A. That is the sub-grade of the tunnel, I presume.

Q. Well, the point is I am trying to get a comparison between the two elevations, one tunnel is, the Broadway Tunnel is about 250 feet lower than the old highway tunnel? A. Yes. [803]

Mr. Tinning: Q. The Claremont Tunnel, you will recall, has an elevation in the neighborhood of 300 feet?

A. Yes; 321, I believe, at the top.

Q. So, the Claremont Tunnel is approximately 500 feet lower in elevation than the Broadway Tunnel; and approximately 700 feet lower than the Old Highway Tunnel?

A. I believe that is approximately correct.

Q. From your experience in driving the Claremont Tunnel, would you say that the cherts that you encountered there were better than those that you saw in the Old Tunnel?

A. I think that they were; the laminations were closer, and the material would stand at a greater span; that is, they supported an open structure better in the Claremont Tunnel.

(Testimony of Lewis Michael Larson.)

Q. Then, if I understand your answer, it is your opinion, from driving that tunnel, that the material was better in the Claremont Tunnel,—the cherts better, had more sustaining power,—than in the Old Highway Tunnel?

A. I thought the laminations were closer.

Q. Would you answer my question?

A. I thought they were slightly stronger, yes.

Q. You thought they were stronger?

A. Yes.

Q. How about the Broadway Tunnel?

A. May I ask just what you mean by the question?

Q. Were the cherts in the Broadway Tunnel better than those in the Claremont Tunnel?

A. I know nothing of the cherts in the Broadway Tunnel; I did not see any of them.

Q. Did not see them?

A. No; unless those were chert sections that we ran through. They may have been shale sections; those that I have enumerated on my experience in the tunnel. My reason for saying that is that Dr. Louderback told me they were not cherts but shale. I had previously enumerated, in my notes, that they were [804] cherts.

Q. From your experience in the Claremont Tunnel, would you say that the Orinda formation which you found in the Claremont Tunnel, at an elevation of approximately 500 feet lower than the elevation of the Broadway Tunnel, was better,—

(Testimony of Lewis Michael Larson.)

stronger material,—than the Orindan encountered in the Broadway Tunnel?

A. I hadn't arrived at the conclusion; the reason for that being this was a different type of deposit. It was a deposit either of flood waters, apparently, or a deposit of material in the lake formation. My experience was new on the Orindan, and I could not conceive of what might be the result of the difference in depth of this material.

Q. When you inspected the Boardway Tunnel in August of 1935, and you passed through those drifts that were driven from the east portal through the Orindan formation, did you form any opinion as to the characteristics of that Orindan as compared with the Orindan that you encountered in driving the Claremont Tunnel?

A. I thought that they were less firm; that was my conclusion, looking at it after the drift had been opened for a period of time.

Q. That was the reason you did not form an opinion: you knew the drifts had been opened for some time?

A. I knew they had been, and I was not in a position to know what the weathering effect might have been, and I was not in a position to draw an accurate conclusion.

Q. When you passed through those drifts in August of 1935, did you notice any of the timbers, that were supporting those drifts, showing strain or stresses?

(Testimony of Lewis Michael Larson.)

A. I saw a few where blocks of material had lodged against them, where the timbers had to have reinforcing, by either stulls or sets placed adjacent to the other set.

Q. Did you see any timbers that were broken, forced out of line, [805] except for the blocks of material falling on them?

A. I don't recall, now, that I did.

Q. There was no evidence of heavy pressure in those drifts?

A. There was no evidence of pressure other than that of loosened rocks; that was my conclusion, as I recall it now.

Q. Well, blocks are pieces of material that have dropped out of the roof? A. Yes.

Q. Or the sides? A. Yes.

Q. That is a characteristic of Orindan, is it not? A. It is a characteristic of Orindan, yes.

Q. You saw no evidence of pressure such as you saw at the point we have been discussing in the Orindan where you had swelling ground in the Claremont?

A. No. I believe, Mr. Tinning, that that portion which we have been discussing in the Orindan was not Orindan; that would be my conclusion. I may be wrong about that; I am not a geologist; but it was an intrusion that was found only at that one point in the total of some 7000 feet of Orindan.

(Testimony of Lewis Michael Larson.)

Q. In other words, the material may have been; it was in what is shown on Dr. Hulin's map as Orindan; that is at Station 94,—the one where you had to put in the double barrel?

A. That was in the Orindan section.

Q. Where you required the double blocks, it was in the Orindan section. You found no condition similar to that condition when you inspected the timbers in the drifts in August, 1935, in the Broadway Tunnel? A. I did not.

Q. Mr. Larson, I am going to refer now, for a time, to Dr. L' ıderback's report, Exhibit 22.

Your Honor, it may be of assistance to have this before you; it is a copy of the one that is in evidence, Exhibit No. 22. This is one of my file copies.

[806]

Q. Mr. Larson, if you will look at page 1 of the report,—Plaintiff's Exhibit 22—there is a paragraph I would like to direct your attention to,—"Proposed New Tunnel Road"—because it refers to some general matters.

> "The following is a report on the geological conditions along the line of the proposed new low tunnel highway between Alameda and Contra Costa Counties, based on observations made on the ground surface along and in the vicinity of the proposed highway and tunnel line, with the aid of such clearing, cuts and artificial openings as were made up to June 18, 1932, supplemented by laboratory studies of

(Testimony of Lewis Michael Larson.)

some of the collected material. The proposed line is that indicated on the map entitled: Joint Highway District No. 13, Topography from Broadway to West Portal, Nov. 6, 1930, and corresponding profile dated March, 1931, and on the plan and profile of tunnel dated May, 1932, and in geological cross section dated July 7, 1930."

I call those matters to your attention, because I understood, from your testimony, that you read a copy of a portion of Dr. Louderback's report, pages 13 to 19, dealing with the geology of the tunnel, and that you never saw, as I understand it, the rest of the report?

A. Not at that time that I read the tunnel geology. At the time I read the tunnel geology, I had not seen this; I had not seen this prior to the entering of the bid; that is what your purpose is in the question, I believe.

Q. That is what I have in mind. When you were preparing your bid, and making the assumptions that you have stated you made, you were basing them entirely upon the information which was furnished you by someone in the Six Companies office, —I believe it was Mr. Calhoun who gave you that data?

A. A copy of the geological report.

Q. Yes; a copy of those pages of the geological report? A. That [807] is correct.

(Testimony of Lewis Michael Larson.)

The Court: Q. So I may follow that testimony: Mr. Calhoun, in the Six Companies' office, gave you portions of Dr. Louderback's report?

A. Yes; the portion between pages 13 and 19, that covered the tunnel geology.

Mr. Tinning: Q. And you had, in addition to the pages that you have just stated you got from Mr. Calhoun, a tracing of the map which was made by him, and which is an exhibit here,—Plaintiff's Exhibit 23—might I have it, Mr. Clerk? Exhibit No. 23, Mr. Larson, if you will look at the last map in the geological report, it is the last document—the map attached to the report which was apparently a tracing taken from that?

A. Apparently, yes.

Q. Now, you also had that map on Exhibit No. 23 before you when you were considering Dr. Louderback's report. A. Yes, I had.

Q. Those were the only portions of the report which you had in your possession at the time that you prepared your estimate?

A. They were the only portions that I had at that time.

The Court: Is that true of the other report?

Mr. Tinning: Yes, your Honor.

Q. Mr. Larson, I am just trying to clear this up.

The Court: I just wanted to follow the testimony; that is all.

Mr. Tinning: Q. I understood that all you had, Mr. Larson was the pages dealing with the tunnel

(Testimony of Lewis Michael Larson.)

geology; you did not have the first page that refers to the various things in the paragraph I read to you; you had only pages 13 to 19, and the tracing that Mr. Calhoun had made of the last map which is attached to the report? A. That is true.

Q. You had no other part of the geological report made by Professor Louderback, before you, when you arrived at your conclusion [808] respecting the conditions that would be met in the construction of the Broadway Tunnel?

A. That is true.

Q. Will you please open the geological report to the next to the last map that is attached thereto, Mr. Larson? You will notice that that is a map,—a geological map,—dated May, 1932?

A. Correct.

Q. Plan and profile of the Tunnel. The diagram which you looked at, in the preparation of your work, was prepared in July, 1930, by Dr. Louderback? A. Yes.

Q. It so appeared on the report that you had?

A. Yes.

Q. If you will look at the last map appearing in Plaintiff's Exhibit No. 23, the Louderback Report, you will see the map was dated July 7, 1930?

A. Yes.

Q. And that it shows, in addition to the matters that appear on the diagram, or the tracing that was made by Mr. Calhoun, a so-called final location?

A. Yes.

(Testimony of Lewis Michael Larson.)

The Court: "A final location"?

Mr. Tinning: Yes, final location.

Q. That did not appear on the document that you had?

A. No; I believe it did not. I think he gave only——

Q. Well, Exhibit 23 was the tracing of the——

A. Yes, just this portion.

Q. Yes; and did not show the proposed alignment of the tunnel? A. No.

Q. Now, in the extreme left of Exhibit 23, you will notice Mr. Calhoun sketched in something called "Hill Wash and Creep"? A. Yes.

Q. On the sheet dated May, 1932, you will find, at the extreme left of the sheet, "Overburden of Stream Deposit and Hill Wash and Creep"? You will see that that extends from a point considerably west,— [809] over 100 feet—125 feet west of the portal of the tunnel, to a point five or six or seven hundred feet east on the hill slope?

A. To Station, approximately, 115 plus 50.

Q. Yes, from approximately Station 108. Now, that dotted line signifies unknown location, doesn't it; it is a generalization, and simply indicates an unknown deposit?

A. I think that was the intention of Dr. Louderback.

Q. Well, that is what an engineer ordinarily would conclude from that statement?

A. Yes.

(Testimony of Lewis Michael Larson.)

Q. When you made your estimate, you had never seen this map, on which it is referred to, on the first page of Dr. Louderback's report?

A. I had never seen this map that you are indicating now. I have not been able to tie it in.

Q. Well, so you can understand the thing, you will see, on the first paragraph on the first page of the report, reference to the plan and profile of tunnel dated May, 1932?

A. And the geological cross section dated July 7, 1930. [810]

Q. Now, referring to the diagram which you had not seen, and reading Dr. Louderback's report commencing page 13:

"West Portal

"The material at the portal as indicated in profile is largely stream wash, hill wash, and creep,—soft, weak and pervious to water."

The Court: That has reference to the stream deposit?

Mr. Tinning: Yes. (Continues reading):

"In the actual construction much of this will probably be removed entirely by open cut, any that remains will require positive support as it cannot be expected to maintain itself unsupported for any length of time.

"The hill slope from the indicated portal up to near the crossing of the present 'tunnel road', carries a considerable covering of hill

(Testimony of Lewis Michael Larson.)

wash and creep material, largely consisting of a fairly loose sandy soil. Its depth cannot be accurately estimated. At about 950′ elevation it is about 15 feet thick, and above this towards the present tunnel road it varies from about 10 to 3 feet in thickness. It erodes out very easily under the action of running water and the road culvert has had its outlet position changed at least twice, apparently due to the deep trenches the water has cut.

"Near Station 113, from altitude 860—870 is a bench that appears to be a stream terrace the back part of which carries a thick coating of wash and creep material from the hillside above. It all lies above the level of the tunnel roof but would have a tendency to carry water for awhile after rains and feed it down into the tunnel.

"Monterey (Subrante?) Sandstone.

"The first bedrock formation encountered is of sandstone and [811] sandy shale, probably of the Monterey Group (Sobrante Sandstone?). The sandstones are light gray when fresh, light ochreous colored when weathered. When fresh they are firm, sometimes hard and resistant, but most of the material slacks on exposure to the atmosphere, exfoliates and crumbles down. On weathering it assumes a pale yellowish or ochreous color and mostly disintegrates into

(Testimony of Lewis Michael Larson.)

sand. The sandy shales when fresh are brownish and firm but also slack, exfoliate, and disintegrate on exposure at the surface of the ground. A test tunnel recently run in about 124 feet in the west portal region exposes the fresh sandstones and sandy shales in the face. If this fresh and relatively unbroken condition continues, the formation will prove satisfactory insofar as sufficient height of such material lies above the tunnel roof to give satisfactory support. Where it is but a thin mass between the tunnel roof and the overlying disintegration products it is desirable to plan for its artificial support or removal even if it stands well on first opening.

"Even in the tunnel these rocks will be subject to gradual slackening, although much more slowly than when exposed at the surface of the ground. This should cause but slight difficulty during construction, and when the formation is protected by the finished tunnel lining this action will no longer be effective.

"As at the surface of the ground, only the weathering products are to be observed, before actually driving the tunnel through, the condition of this formation along the tunnel line, and depth to the top of the fresh firm rock, can be determined only by test holes or borings. The condition shown in the face of the tunnel

(Testimony of Lewis Michael Larson.)

are promising of satisfactory conditions beyond.

"On the surface the sandstone ends about at the present 'tunnel road' which probably means that along the proposed tunnel line it [812] would end about Station 118 or 118 + 50, 175 feet—180 feet underground.

"For statement of oil and gas possibilities see under Claremont Cherts.

"Claremont Cherts.

"After leaving the sandstones the prevailing formation for about 1200-1300 feet, is the Claremont Chert (called Claremont Shales in the San Francisco Folio of the U. S. Geological Survey). This formation consists chiefly of a series of alternations of layers of chert from 2-6 inches or more thick, and somewhat thinner layers of siliceous shale. Occasionally a layer of clay shale, sandstone, siliceous ferruginous limestone, or volcanic ash is encountered.

"Water. The strata of this formation intersect the ground surface at steeply inclined angles, and they are cut by many small faults, which in many cases also intersect the surface. The cherts are quite brittle, and any fractures or crush zones produced in them by earth movements tend to remain open and allow free movement of water. The combination of these characters generally results in water flowage through

(Testimony of Lewis Michael Larson.)

many lines in the formation. Previously stored water may be tapped by the tunnel driving. The Claremont tunnel penetrated this formation at a greater depth, and therefore under conditions likely to develop more water than the proposed tunnel. It also encountered it where affected by marked faulting. Nearly 700 gallons a minute were yielded by the cherts when first penetrated, but this yield has since dropped to less than 50 gallons a minute.

"The old inter-county highway tunnel lies entirely in the chert formation, but at a still higher level than the proposed tunnel. I do not know whether it developed much water during construction. It must have yielded some but probably not very much. At present, [813] after rains, there is a certain amount of drip and seepage into the tunnel, and a similar renewal of water flow after rains would undoubtedly take place in the cherts penetrated by the proposed tunnel, even after all storage water had been drained off.

"Fortunately none of the rock types found in the Monterey chert formation as developed in this area suffers from contact with water. They all stand as well wet as dry.

"Oil and gas. The cherts and most of the shales of the Monterey formation are bituminous, and on being heated to a high temperature yield oil and gas. This property, however, is

(Testimony of Lewis Michael Larson.)

not likely to cause any trouble in the course of tunnel driving. But in the course of the geological history of these rocks, some oil and gas has been developed and may be encountered in tunneling, where formation is moderately dry."

(After recess.)

Mr. Tinning (Continues reading):

"In the Claremont tunnel, presumably largely due to the very free flow of water through the cherts, but little oil and gas was encountered, and no trouble was experienced from this source. It may be added that on account of gas troubles in the Chico formation, the tunnel was worked with strict rules about open lights, matches, and smoking, and this may have had something to do with the lack of gas trouble in the cherts. Some of the oil and gas which undoubtedly originated in the Monterey chert formation, was found in the Orinda formation at and not very far from the contact with the cherts. The oil and gas had apparently penetrated the Orinda formation along small faults and fissures. They caused considerable trouble in the eastern part of the Claremont tunnel, where at one time a heavy blast in the face set fire to the oil and gas which in turn ignited the timbers, entailing much delay and expense.

"In the San Pablo tunnel, where the body of cherts is more [814] closed in by overlying

(Testimony of Lewis Michael Larson.)

rocks than in the proposed tunnel, a serious explosion occurred while they were driving through the cherts.

"It is possible that some oil or gas or both developed from the cherts, may have found its way into the Monterey (?) sandstones, and it would therefore be a measure of safety to drive the tunnel with suitable precautions, especially as the cherts are approached within a few hundred feet. If light oil is struck in any part of the tunnel, it should not be allowed to collect in pools or depressions or stand in drainage ditches as it may gradually develop gas and become liable to ignition or even explosion, setting fire to timbers or causing worse damage. It is impossible to predict the exact location or amount of such material that may be encountered. It may be little or none, or it may be in troublesome amounts. It should be watched for and given immediate attention if encountered.

"Structural Characters. In general the chert belt is rather regular in its structure, the strata dipping high (56°-80° at the surface) to the southwest.

"The southwest 100 feet or more of the chert is the most irregular part of the belt intersected by the proposed tunnel line (about 118+50 to 119+50). It is cut through by a fault of considerable magnitude which is probably a continuation of the Wildcat fault of the San Fran-

(Testimony of Lewis Michael Larson.)

cisco folio. This fault has caused more or less shearing, and displacement along subsidiary fractures with rotation of minor blocks and crushing in certain zones. To the northeast of Station 120+00, the structure appears to be remarkably regular to the northeast limit of the chert belt, although there are present some minor faults and crushed zones.

"The fault zone will be occupied by broken and possibly crushed chert. In the Claremont tunnel, the chief yield of water from the cherts came from this fault zone. [815]

"In driving through the cherts, the combination of crushed zones and water often presents difficulties. The crushed rock (with or without water) may flow out into the tunnel almost like quicksand, or, if it holds together better, it may develop considerable pressure, until the water pressure is relieved by free flow into the tunnel. In the Claremont tunnel the careful driving forward of spiling was necessary in the more broken and the crushed portions of the chert. In certain cases where a broken or crushed mass of rock lies within intersecting fault planes, and thereby loses its bond to surrounding rock, it may slump down into the open working, leaving a chamber in the wall or roof. If this is experienced at all in the proposed tunnel it will probably be in the southwestern fault zone mentioned above. If such unsup-

(Testimony of Lewis Michael Larson.)

ported blocks or masses are met, it would probably be best to let them down or remove them, before placing the concrete of the completed structure.

"Based on experience gained from other tunnels in the cherts, and judging from long exposed steep quarry faces in the same formation, it may be expected that after driving, and after the material in the immediate vicinity of the tunnel has come to equilibrium, the rock will stand well and need no support. The main belt of the cherts beyond the fault zone has a particularly favorable structure from this standpoint, and is the strongest and most stable material to be penetrated by the tunnel. Even the part in the fault zone is likely to stand well after the driving through it is completed. This was the experience in the Claremont tunnel.

"The Orinda Formation.

"From about Station 130 (as judged by surface dip, but it may be farther along in the tunnel as the dip may steepen underground), to the east portal of the proposed tunnel, the bore will be entirely in the Orinda formation of Pliocene age. This formation consists of [816] a series of alternations of beds of consolidated gravel, clayey sandstone, and sandy clays, which were laid down as fresh water deposits. The beds dip at high angles (50°-60°) to the south-

(Testimony of Lewis Michael Larson.)

west. Tunnel driving is generally rapid in the sandstones and clays, somewhat slower in the gravels, which are naturally harder on drill steel. The formation usually breaks rather blocky and often develops a certain amount of overbreak.

"Water and Its Effects." "Water is usually in very slight amount in the Orinda formation, coming in along certain gravels and coarse sands, or seeping along minor faults or shear zones. Most of the formation is likely to be dry. In the tunnels already driven through it, the greater part of the clayey sandstones and clays were dry and dusty.

"While these sandstones and clays are naturally mostly dry, they are generally affected by contact with water. In fact they are sensitive to both drying and wetting, and a chunk removed from underground and exposed above ground usually cracks and slacks in the sun, and breaks down into a soft clay or mud in the rain. While the beds are firm, and when dry stand well underground, they carry but little natural cementing material, except in occasional layers. These cemented layers remain firm even on exposure to sun or water.

"Where not badly sheared this formation is likely to stand well provided it is protected from water action and air slacking. In the Lafayette and Claremont Tunnels where water (a com-

(Testimony of Lewis Michael Larson.)

paratively small amount) came down through sheared clays or clayey sands, a locally weak zone was produced that made weight on the timbers, or slowly pushed them in laterally. Such zones required special support. If such zones occur along the proposed tunnel line they are likely to be narrow, and not very serious.

[817]

"In the flood that occurred in the east portal region of the Claremont tunnel (flood water coming in from San Pablo Creek), the water filled the tunnel and stood against walls and roof as well as floor. Portions of the roof slumped down, causing considerable chambers that ran 20 or 30 feet above the tunnel roof line, A number of timbers slipped in laterally, and in places timber sets collapsed before the water was all pumped out. I mention this to illustrate the effect of water lying against an exposed surface of the formation.

"Along the proposed tunnel line conditions are very good from this standpoint, as no important source of underground water exists upgrade from the Orinda beds. It should be easy to prevent the water from the cherts working up into the Orinda region. During construction and later, the tunnel bore through the Orinda beds should be protected from possible influx of water from the surface drainage near the junction of the Tunnel Road and the Fish

(Testimony of Lewis Michael Larson.)

Ranch Road (called on map, Claremont Avenue Extension).

"As naturally exposed at the ground surface, the Orinda formation slacks down into soil and gives very few rock exposures. It is also subject to landsliding. Such a slide has taken place just below the chert contact and about 100 feet north of Station 134. Its movement has been northward away from the tunnel line. Another lies 50-100 feet south of Station 136 and has moved eastward. These are somewhat off the tunnel line, are superficial and have affected the ground for a depth of but 15-30 feet where the tunnel lies 200 or more feet below the surface. Landsliding in this formation does not take place when it is dry and normally occurs following a rainy season, especially one of above the average precipitation. As the slope of the ground is fairly steep near the east portal, and as it may be steepened and otherwise disturbed during tunnel [818] operations, the possibility of the sliding or slumping of this formation in the portal region should be kept in mind and guarded against.

"Support. I believe that in general this formation will stand well if reasonable care is taken in handling it, except near the east portal where the overburden is comparatively slight, and the surface influence may have weakened or may in the future weaken the material suffi-

(Testimony of Lewis Michael Larson.)

ciently to require artificial support.

"Oil and Gas. As noted above, under the Monterey Cherts, it is possible that some showing of oil and gas derived from the cherts may be encountered in driving through the Orinda formation. Their occurrence in this formation is so irregular that their presence cannot be definitely predicted but it would be well in driving the tunnel to watch for them and, in case their presence is noted, and they can be easily recognized in this formation, use care in blasting and have no open lights or flames. See further the statement under Monterey Cherts.

"Tunnel Earthquake Relations.

"As far as we have any definite evidence concerning the faults that cut the proposed tunnel line, their movements were connected with a period of geological activity that is past. There is no field evidence, or evidence from history or from our seismographs that any movements have taken place along these faults in recent times. While the evidence is wholly negative, I believe that it is reasonably safe to assume that no fault will by its movement cut or directly deform any structure that may be placed in the belt under consideration. That future movements will take place farther west near the base of the hills is probable, and it is also likely that the tunnel formations will be shaken by future earthquakes. The rocks should, however, stand

(Testimony of Lewis Michael Larson.)

satisfactorily even in the face of a severe shaking up by [819] an earthquake, any weak near-surface stretches in the region of the portals possibly excepted.

"Tunnel in General.

"In a general way the rocks and rock structures that would be encountered in the proposed tunnel are favorable from the engineering standpoint. The strata mostly dip at high angles and are intersected by the tunnel at a high angle to their trend. Such a condition restricts the width of belts that may show local weakness or much water, and presents the strongest arrangement of the type of strata involved, and the easiest to deal with in tunneling.

"Throughout the main belt of cherts, the rocks may be expected to be entirely self-supporting indefinitely; in the fault belt of cherts and in the Oridan, with proper care in driving and handling, the rocks should stand well and be self-supporting except possibly along certain shear zones which may require local reenforcement to withstand local pressure (not general weight). These statements do not refer to any measures that may appropriately be taken to prevent the detachment or falling of fragments or blocks from the surfaces exposed by the tunnel, but to general support of the mass of rock in the sides and roof of the tunnel.

(Testimony of Lewis Michael Larson.)

"Near the portals the rocks will probably be found weak and will require positive support to prevent movement or caving.

"The question has been raised as to the relative desirability of a single larger tunnel or two smaller ones. The relative advantages in operation of the finished tunnel or tunnels are outside the scope of this report. The geological aspect is related to construction and to the maintenance of the integrity of the finished structure. I do not know of any geological considerations that would indicate that the smaller tunnels are feasible and a larger one not. [820]

"It is certain that in cases where support is necessary or resistance to any possible earth pressure must be provided, the forces or stresses involved will be much greater with a larger tunnel and the problem of handling such conditions to that extent more serious. I have at present no reason to say that the larger tunnel would be impossible or that it would constitute a risk that should not be taken."

The rest of the report, I think, Mr. Larson, deals with outside conditions and was not used in arriving at your conclusions as to what you would have to encounter in driving these tunnels?

A. That is true. [821]

Q. Going back to the west portal, did you consider, Mr. Larson, in preparing your estimate, that

(Testimony of Lewis Michael Larson.)

there was an unknown and indefinite amount of stream wash and hill wash and creep at the west portal of the tunnel?

A. I took into account—

Q. Will you asnwer that question "Yes" or "No" and then explain?

A. Yes. I took into account what is shown on that sectional blueprint made by Dr. Louderback and I might mention that the other one apparently was not made by Dr. Louderback, but the one I referred to made July 7, 1930 indicated a certain amount of wash, and I noticed, too, when I prepared my estimate, that the tunnel portal was at 111 plus 42 on the north side and 111 plus 53—those are approximate stations—and the appearance that I would get from this Dr. Louderback drawing is that at that point there would not be any of the hill wash, and I noticed that in his remarks that most of this material would probably be removed by open cut. I must go into this in considerable length in order to answer your question on that. I noticed that in all of his remarks there were generalizations in his conclusions. He gave an answer or a definition to those generalizations and those are the things that influenced me more than the detail on which he based those conclusions. I took into account the fact that there might be a slight covering over a certain portion of this westerly section, and that is the reason why I first

(Testimony of Lewis Michael Larson.)

used the drift method and then later used the wall plate method, planning to leave the timber in in that portion. But I must say this, that the grouping on the wall plate section indicates that it covered only the Monterey sandstone section.

Q. Mr. Larson, I was directing my question to the hill creep and soft material that is shown on the blueprint which is referred to in Dr. Louderback's report at page 1 as being the map and profile [822] of May, 1932, which you have just said was not prepared by Dr. Louderback, but is referred to in his report, and for your information I will say that it was prepared under his direction and it is the profile of the location at which the center line of the tunnel was located, and the location of the profile shown to you is not the location upon which the tunnel was constructed?

A. Of course, I previously testified to that Mr. Tinning, that I did not have the blueprint, consequently I could not give it consideration from that print.

Q. You did not have that information and on the tracing that you had, Exhibit 23, if you look carefully you will see the words, here, "Depth not known."

A. Yes, I note that.

Q. That was not on what you saw, was it?

A. Well, there was a line indicating it, a faint line.

Q. But there was not the words "Depth not known"?

(Testimony of Lewis Michael Larson.)

A. No.

Q. In other words, the data that was furnished on the blueprint of 1932, which was more complete, shows the stream deposit and hill wash to be considerably deeper and shows it to extend into the tunnel section, into the place required for the construction of the tunnel.

A. The average portal tunnel is at 111 plus 50.

Q. The average portal tunnel is at 111 plus 50?

A. That is the average.

Q. You understand from looking at this blueprint of 1932, the one here, the profile drawn in the actual location, that the profile is the center line of the 200-foot right of way required for the tunnel?

A. I note that.

Q. So that the tunnel south bore was on one side of it and the north bore on the other?

A. I note that.

Q. So that you were simply getting an average condition?

A. Yes. [823]

Q. Because when a tunnel is built on curves the south bore station is not directly opposite the north bore station?

A. It is not.

Q. The tunnel is a little longer, that is correct?

A. Yes.

Q. When you made your estimate you had no knowledge of this map which showed in connection with Dr. Louderback's report that the over-burden

(Testimony of Lewis Michael Larson.)

of stream deposit and hill wash and creep is indicated as being of an indefinite depth and extended into a portion of the section which was required for the construction of the tunnel bore?

A. I did not have this blueprint.

Q. You did not know that, nor when you made that estimate did you have data which showed that the hill terrace above the portals of the tunnel was apparently of considerable depth, unknown, but of considerable depth?

A. No, I had reference only to his information as contained in the written report.

Q. And that information, as we have gone through it, indicated that he did not know how deep that was?

A. No; he referred to a certain elevation of 950 and other things that helped me determine or helped me to arrive at a conclusion.

Q. 950?

A. That is elevation 950, I think.

Q. Would you mind looking at Exhibit No. 23? I will hand you my copy of it. Are the elevations shown in that exhibit?

A. The elevation of 800 is shown and 1,000 and 1,100. Can I mention in this connection that I used a scale to determine the elevation when I have a standard from which to measure? In that way I arrived at this.

Q. In other words, you took a scale of your own, your own engineering device, and scaled this off?

A. Yes.

(Testimony of Lewis Michael Larson.)

Q. And the figures on the right-hand side of the tracing made by Mr. Calhoun are figures to indicate elevation above sea level?

A. That is true. [824]

Q. And they are not in the same position?

A. They are with respect to the location of the tunnel, Mr. Tinning.

Q. What I have in mind is that the diagram attached to the report actually has the elevations on the left-hand side of the sheet indicated and that elevation 950 is practically the top, the highest point of the portion indicating sandy soil or stream terrace.

A. You refer now to station 115 plus 75, I believe, don't you? That is where elevation 950——

Q. Intersects?

A. Intersects, yes.

Q. Now, Dr. Louderback's report with respect to this hill creep states it is indefinite in depth, soft, weak and pervious to the water, and that the hill up to the point where it crosses the tunnel road, above the new tunnel, carries a considerable covering of hill wash and creep material, and that its depth could not be accurately estimated, and that it is 15 feet thick at the, about the 950-foot elevation. Now, Mr. Larson, you stated when you first testified, or earlier in your testimony here, that you had inspected the site and seen a pit near the west portal. Was that pit close to this point discussed here as being the 950-foot elevation?

(Testimony of Lewis Michael Larson.)

A. My recollection is it was about at that point.

Q. And I think you said that when you inspected that it disclosed a broken material and gave you no information as to what may lay underneath?

A. That is true.

Q. You saw that on the ground?

A. I saw that on the ground.

Q. He told you in that first portion of his report that the material at the west portal would erode easily and that it would have a tendency to carry water and that it extended up at least to and across the stream terrace, which apparently is the same place that you afterwards had drag lines and bulldozers shove off the surface material to take the weight off the portal of the tunnel [825] where that crack occurred?

A. That would be true as applies to the south tunnel, but probably not to the north tunnel, for the reason that the north tunnel lies under the slope of the hill coming down this way—

Q. The hill slopes—

Mr. Smith: Just a minute. Let him finish his explanation.

Mr. Tinning: He has.

Mr. Smith: He had not, he was in the middle of a sentence.

A. I want to state my reason for my answer. The hill slopes at this angle over the north tunnel, whereas over the south tunnel it reaches a position of repose, or more of a level nature, which would

(Testimony of Lewis Michael Larson.)

indicate that more of the stream wash might be found over the south tunnel than over the north tunnel, which proved to be true.

Mr. Tinning: Q. In other words, your conclusion from an inspection of the site was borne out by what you found when you excavated?

A. Well, I will have to go back to a statement that I made earlier, we found nothing in my examination of the ground which seemed to conflict with the conclusions that Dr. Louderback drew in his report.

Q. That is not an answer to my question, Mr. Larson. I asked you if you found when you excavated anything different from your conclusions drawn from your observation of the site. I am not asking about the report.

A. Very little difference, only one of degree, probably I should say this, I found a mud that I did not expect to find in the south tunnel.

Q. And that south tunnel was built south of the center line that is shown on the diagram attached to Dr. Louderback's report, the diagram you never saw when you made your estimate?

A. I believe so.

Q. And naturally, where the hill was sloping from the north to [826] the south there would be more material over the north tunnel? There is a right of way 200 feet wide, and there would be more material over the north tunnel portal than

(Testimony of Lewis Michael Larson.)

there would be over the south tunnel portal, which was adjacent to the stream you have described.

A. Yes.

Q. And the mud which you found when you excavated was near that stream bed? A. Yes.

Q. And what you would expect to find on a washed hill side below a stream where the rocks were not carrying a stream? A. Yes.

Q. In hill creeps, alluvium materials such as you observed it?

A. Or even, I think, in the disintegration that would result from water flowing over a formation that would be subject to being influenced by air and water contact.

Q. Now, my question is with respect to when you found the cracking material that you testified that you had gotten in and taken care of when you were getting underground in your excavation, was that on this hill terrace that is shown in Dr. Louderback's map?

A. It was under that hill terrace, but not in the south tunnel. In the south tunnel I don't know whether any of that creep was over the south tunnel or not; that is something I am not competent to answer, but I assume that it was.

Q. That material that you removed when you got these hurry-up operations under way and brought down the bulldozers and caterpillars, and built a special road from the tunnel road to the ex-

(Testimony of Lewis Michael Larson.)

cavation that you were driving, and getting underground, was in this terrace area, was it not?

A. It was in the terrace area, but let me qualify that by a statement that I do not believe it was the hill creep that Dr. Louderback's report referred to. I think it included some hill creep and some material in place.

The Court: We will take an adjournment now until tomorrow morning at ten o'clock. [827]

(An adjournment was here taken until tomorrow, Thursday, April 21, 1938, at ten o'clock a. m.)

[828]

Thursday, April 21, 1938;

10:00 O'Clock A. M.

LEWIS MICHAEL LARSON,

Cross Examination (continued).

Mr. Tinning: I just handed the witness a copy of Exhibit 22 to follow.

Q. From what, Mr. Larson, you were able to find in the portion of the geological report including the diagrams, did you conclude that you would require approximately 40 feet to go underground to reach the sandstone?

A. An average of 40 feet; possibly less in the north tunnel; possibly a little more in the south tunnel.

(Testimony of Lewis Michael Larson.)

Q. What caused you to conclude that you would probably require 40 feet of excavation through soft, unsupported material for 40 feet on the north tunnel?

A. I really formed part of the conclusion from the little drift that was driven into in the vicinity of the north tunnel, coupled with the sketch,—the sectional sketch of the tunnel,—which indicated that there would be some float. I am referring now to the one of 1930, July 7th; I think that was the date.

Q. The only one you had seen?

A. The only one I had seen; and I concluded from that and the geological report that there would be a minimum amount. I assumed 40 feet as a safe amount, because, not only on the geological report but based upon previous experience that the portal sections generally require a little different treatent from the other sections.

Q. Well, isn't it a fact that in the portal section, all materials which you find in this Coast Range always require different treatment than the interior or deeper parts of the tunnel?

A. I think that is a matter for too much information there, Mr. Tinning. I cannot say they always do require it.

Q. Well, isn't it a fact that where you have erosion and weathering, [829] the other conditions of exposure, and moisture and air and sun, that, for rocks and material in this region where you

(Testimony of Lewis Michael Larson.)

have this type of sandstones to reach, the materials erode and soften, and therefore you have to give them positive support?

A. That is a position that I took; and it is customary to give that consideration in approaching a tunnel opening, to give it special support.

Q. Isn't that exactly what my question was: that it was customary and ordinary to do that?

A. Yes, I believe it is.

Q. And in addition to the fact that you have soft material, you have something that you mentioned in connection with the Old Tunnel: your observation of that, that the overburden is low in those places; so, you have an unstable, soft condition immediately above the top crown of your tunnel?

A. It is a safe assumption; being a safe assumption, it is one I customarily follow.

Q. Will you point out any place in Dr. Louderback's report where you found anything that indicates that the soft material at the mouth of the west portal of the Broadway Tunnel, on either the north or south tunnels, would be 40 feet in depth?

A. There is nothing to say the distance.

Q. So, you drew your own assumption from your experience, didn't you?

A. That 40 feet of drift in the west end would be sufficient, and 20 feet of drift in the north end would be sufficient, by the drift system.

Q. Yes, the drift system. Thereafter, you passed through that material at the mouth of the tunnel,

(Testimony of Lewis Michael Larson.)

and came to the Monterey or Sobrante Sandstone; and do you consider that, when you reached the point 110 feet in the tunnel,—in the north tunnel,—that you had reached the standstone?

A. I did not know that I had reached the sandstone. I did know this, however: that it did not have the quality that I had expected it would have, from having read Dr. [830] Louderback's report.

Q. Yes. You have told us that before. I am asking you now whether you had reached the sandstone when driving the north tunnel, when you had driven it 110 feet.

A. I will have to qualify that by saying I am not a geologist and do not definitely know whether it was sandstone or not that I was in.

Q. In other words, you cannot say?

A. I cannot say that I was in sandstone.

Q. With respect to the south tunnel which you drove, I think you said 92 feet? A. Yes.

Q. Had you reached sandstone when you had stopped your drift operations at 92 feet?

A. I thought I had, in the three lower drifts; that is, the lower drift, the second drift and the third drift; and assumed that formation, which was just showing signs of stiffening, would continue to increase in depth and cover the whole of the tunnel.

Q. When you say the first, second and third drifts—

A. Those were the three lower drifts.

(Testimony of Lewis Michael Larson.)

Q. Looking at Plaintiff's Exhibit No. 28—I don't think it will be necessary for you to come down here, Mr. Larson, unless you would like to; I just wanted to be sure I understood.

A. Yes.

Q. The lower drift, second drift and third drift progressively rising? A. Yes.

Q. In that part of the tunnel, you had found, at a distance of 92 feet into the hill, material which appeared to you to be the sandstone?

A. That is true

Q. Now, in reading Dr. Louderback's report, I suppose that you had in mind that he stated that these materials to be encountered might be expected to slack on exposure to the atmosphere, and to exfoliate and crumble down? I am referring to what he says under "Monterey [831] Sobrante Sandstone," on page 13, in the first paragraph.

A. May I have your question, again, please?

(Pending question read by the reporter.)

The Witness: A. I should say yes, so far as you have gone, Mr. Tinning; but, if you will read a little bit further, he qualifies that statement.

Q. Mr. Larson, that is a statement on your part as to what he does; I am asking you if you read that; and, having read it, that you might expect exfoliation of this material where exposed to air—I suppose you mean, by "qualification," that the last sentence in that paragraph, in which he says—

A. The last sentence.

(Testimony of Lewis Michael Larson.)

Q. Yes. "This should cause but slight difficulty during construction, and when the formation is protected by the finished tunnel lining this action will no longer be effected."

Mr. Smith: That is not the last sentence.

Mr. Tinning: I am reading this, Mr. Smith.

Mr. Smith: I know; but you said the last sentence of the paragraph. That is not the last sentence.

Mr. Tinning: The last sentence in the bottom of the page; thank you.

Q. That is the sentence you referred to?

A. No; it is not. It is in the last sentence of the first paragraph, under "Monterey Sandstone."

Q. Then, you are referring to the sentence: "Where it is but a thin mass between the tunnel roof and the overlying disintegration products it is desirable to plan for its artificial support or removal even if it stands well on first opening"?

A. Yes, where it is but a thin mass.

Q. Yes. How is that affected by exfoliation?

A. Where exfoliation occurs, Mr. Tinning, it will occur—the surface exposure; [832] that is the part that is exposed to the atmosphere; if it is only a small layer, it will probably penetrate the whole of the body and cause exfoliation; but, where you have a mass, it only hits the surface, and the loose portion of it does not exfoliate until that mass is removed.

(Testimony of Lewis Michael Larson.)

Q. By "exfoliation," you understood, did you not, the quality of the material when moisture or air reaches it to expand like lime that is slaked,—it gets bigger, thicker, and occupies more space?

A. Well, "exfoliation," is I understood it, Mr. Tinning—it is a tendency, along the line of your explanation, but causing it to flake off.

Q. Well, when it flakes off, it expands, does it not,—thickens?

A. That is a technical question; and one I am not qualified to answer.

Q. "Slacking,"—what do you call that?

A. "Slacking," as I intended it, means that small particles will gradually come off, and expose new surfaces which, in turn, will disintegrate.

Q. The disintegration process; it crumbles down into the sand,—the small particles? A. Yes.

Q. You understood, from the last sentence of the last portion of the last paragraph on page 13, that you might expect slow slacking during construction, and that that would not cause particular difficulty; but, when the formation is protected by the finished tunnel lining, this action will no longer be effective?

A. Yes; that is what the Doctor said; that was my understanding, yes.

Q. When you planned to keep your concrete lining within 300 to 350 feet of the excavation point, you had that in mind, did you?

(Testimony of Lewis Michael Larson.)

A. I had that in mind, yes; and had provided for it, by making that a timbered section.

Q. You mean, by that, providing that you were permitted to leave [833] the timbers here in that section?

A. That was my plan. My estimate shows that.

Q. Was it likewise one of the reasons that you planned the next 720 feet of tunnel in the Sobrante formation to be timbered permanently?

A. That was precautionary, purely.

Q. It had nothing to do with exfoliation or slacking?

Mr. Smith: Just a minute. I submit the witness had not completed his answer.

Mr. Tinning: I have a right to ask him a question.

Mr. Smith: You have no right to cut the answer off.

The Court: We have been getting along so nicely here. The witness, under the rule, will answer the question; and then he may explain it, if he wishes. Proceed. Read the question.

(Pending question read by the reporter.)

Mr. Tinning: See—The witness did not answer my question.

The Court: Q. Answer the question.

Mr. Tinning: Q. The question, Mr. Larson, was: Was one of the reasons that you planned to maintain the timbers permanently in the next 720 feet, under the method you proposed, because of

(Testimony of Lewis Michael Larson.)

the slacking and exfoliation qualities of the materials, through the Monterey Sandstone through which you were driving, were exposed?

A. No; not entirely.

Q. Was it, in any degree?

A. Yes, in part.

Q. Now, explain it.

A. My intention, as I tried to explain, was to be ultraconservative in my estimate. I did not think that it would be necessary to use the timbers throughout that 720 feet; but I introduced it, as a precautionary measure, to make my estimate what I would term "safe." That had more to do with it than any fear of slacking or a tendency of that material to exfoliate, before it would require other support. [834]

Q. I will show you one of our copies of your Exhibit No. 27,—the method that you proposed for excavation; and the exhibit shows a shaded portion on the westerly end of the two tunnels, which you testified was the distance of 720 feet plus 20 feet at— A. Plus 40 feet.

Q. Yes—The legend on that exhibit shows that you expected, within the shaded area, to install permanent timbering? A. That is correct.

Q. And you considered, as I understand it, that permanent timbering was advisable, or necessary, in those portions of the tunnel, when you prepared your estimate, because the ground there, you assumed, was self-supporting?

(Testimony of Lewis Michael Larson.)

A. I cannot say "Yes" to that, Mr. Tinning. I will have to say positively "No." I did expect a good portion of that to be self-supporting, but, as I stated before, it was a precautionary item put in there. I did not think the full amount of 720 feet would really require this; but neither did I feel, Mr. Tinning—Let me enlarge on it—that any of the "B" section would be ordered; I did not think that liner plates would be required; but those things were put in merely to make the estimate safe.

Q. Well, the District Engineer had a right to order "B" section if he wanted?

A. He had a perfect right to order it, yes.

Q. In indefinite amounts?

A. Yes. I cannot say "an indefinite amount."

Q. Well, you considered he could order any "B" section put in, and you figured the price per foot you thought was proper to pay?

A. Yes; but I wish to enlarge on that, and make myself understood, and make my position clear: It is customary, in all estimating, I believe, or, at least, that I have had anything to do with, [835] to have a standard section and then another section, or something whereby, if the Engineer has the right to depart from the standard—I have always thought that to be a legal interpretation, or legal precaution; and it did not mean, because the "B" section was indicated there, that the Engineer had any intention—I am speaking of my mind and my thought—had any intention whatever to order it; but merely

(Testimony of Lewis Michael Larson.)

to give him the right to depart, even to an exaggerrated degree, from the standard section. That is what I had in mind.

Q. In other words, if he met, in the driving of this particular project, conditions of great severity, he had a section to meet those conditions with?

A. He could go anywhere between the standard section and the "B" section.

Q. That is your impression: that he could do anything between "A",—the standard section, which was installed in the tunnel under the plan of timbering which you have here—anywhere between that and the "B" section; that was your interpretation of these plans and specifications?

A. That is my thought, within certain limits. I will say within certain legal limits. I don't know what those legal limits are.

Q. I am not discussing legal limits. We are talking about this direct question. Did that "B" section call for an invert? A. It did.

Q. It called for a thicker wall? A. Yes.

Q. It is your understanding that, instead of putting an invert in, when you were preparing your bid, he could ask you to put in a strut across halfway, say, at the partition line,—something of that kind? Is that what you mean: anywhere in between?

A. I think he provided for certain bars in there, —a heavier—that is, stiffer point where the venti-

(Testimony of Lewis Michael Larson.)

lator platform was, for a distance of about 15 [836] feet above the floor slab—He indicated, there, some rods that had a tensile tendency, from compression members, as I remember it. I am not trying to state what the Engineer had in his mind; but my interpretation of that and he had a right to depart from the specifications where, in his judgment, it was necessary.

Q. And when he departed from the plans, he could go anywhere, between the standard "A" section and the standard "B" section, that he thought was right?

A. That would be my interpretation. [837]

Q. You understood that this sandstone might require permanent support and you provided for it by leaving the timbers in in your proposal, and you hoped that you would not need them all: is that a fair statement?

A. Hardly, Mr. Tinning. I should say rather that I had in mind that a portion of it would require positive support, and, as I explained before, the other was purely precautionary, but I had taken Dr. Louderback's own definition of these general statements which are contained in his conclusion as my guiding star.

Q. You have told us that before, Mr. Larson, a number of times, and I will assume in this examination that the general statements were your guiding star, but we are now coming back to some specific statements. You said the other day, I think

(Testimony of Lewis Michael Larson.)

it was the second occasion when you visited the site of the tunnel, that you visited Dr. Louderback and discussed this with him.

A. It is my recollection it was the second day.

Q. And that would be sometime in March, 1934?

A. It must have been, yes, in the early part of March.

Q. The early part of March, 1934?

A. Yes.

Q. Because you went away March 20 and were gone a month? A. That is about correct.

Q. You went to see Dr. Louderback at what place?

A. At his office in the University grounds.

Q. Is that in Bacon Hall, a round brick building? A. I believe that is the name of the hall.

Q. Who was present when you discussed this matter with Dr. Louderback?

A. Mr. Fontaine, Dr. Louderback, and myself.

Q. Had you telephoned Dr. Louderback for an appointment to see him? A. Not that I recall.

Q. You have no recollection?

A. I have no recollection of it. [838]

Q. But you would not say that you did not?

A. I would not say I did or did not.

Q. At the time that you went to see Dr. Louderback did you tell him that you were preparing an estimate?

(Testimony of Lewis Michael Larson.)

A. I am not sure that I told him I was preparing an estimate, but I did ask him about the geology of this tunnel, and possibly I might have said that I was preparing an estimate. I am not clear on that.

Q. Did you not at that time and place, at his office, ask him or state in substance and effect that you were preparing an estimate for a bid on the Broadway Tunnel and that you had seen his geological report, and that you wanted to talk to him a little more about the Monterey Sobrante sandstone referred to in his report? A. No.

Q. The claimed formation that would be encountered?

A. No, my recollection is that I had not seen the report at that time.

Q. To make your answer definite, it is your recollection that you did not tell him that you wanted to discuss that matter, the first material that would be encountered as you drove the tunnel from the west toward the east, the Monterey Sobrante sandstone?

A. I have no recollection of that particular statement.

Q. And it is your further impression that you went to see Dr. Louderback before you had read his report? A. I believe that is true.

Q. Then is it not a fact that at that time and place you asked him if he could tell you something more about the material than his report stated?

(Testimony of Lewis Michael Larson.)

A. I don't remember that I asked him in that way, Mr. Tinning.

Q. Then your answer would be, so far as you can recollect, no?

A. That would have to be my answer.

Q. Did he tell you, following along in the conversation, that [839] he did not know of any tunnel or other construction work that had been built in the Monterey Sobrante sandstone?

A. He possibly did; I could not say yes positively to that.

Q. Did he tell you that you had experienced a narrow belt of this sandstone in the Claremont tunnel, just a few feet?

A. I have no recollection of that.

Q. You have no recollection of that? A. No.

Q. Did he explain to you that there was no surface exposure of the formation and that only residual soil appeared on the surface? In other words, that there were not any outcrops of these sandstones, did he tell you that?

A. I have no recollection that he told me that.

Q. Didn't he tell you he did not know how deep you would have to go to find cementation in this formation?

A. I have no recollection that he made that remark.

Q. And that the only thing that he knew was that the formation was mainly sandstones which weathering disintegrated?

(Testimony of Lewis Michael Larson.)

A. I do not remember the details to the point that you are stating them, Mr. Tinning.

Q. Did he tell you and Mr. Fontaine that he thought in making up your estimate that you should consider the sandstone as the worst part of the tunnels, and that a large part of it would require positive support?

A. I don't remember it to that effect.

Q. And that by so considering the sandstone and the conditions to be met in going through them, if the actual conditions encountered were better it would be to your advantage, to the contractor's advantage?

A. I have no recollection of that detailed statement.

Q. Now, at that conversation following the discussion respecting the sandstone did Dr. Louderback tell you that you had had experience [840] in the cherts formation in the Claremont Tunnel, which was similar?

A. He may have; I do not recall it; I won't deny it.

Q. And that you undoubtedly would have the same kind of trouble experienced in the Claremont Tunnel in driving the Broadway Tunnel through the cherts?

A. I can't remember the full details.

Q. Was that in substance what he told you?

A. If you will permit me I will tell you what he told me as I remember it.

(Testimony of Lewis Michael Larson.)

Q. I think we had better follow through with specific statements.

A. I don't remember that detail.

Q. So far there is nothing that I have asked you that you remember specifically?

A. No, I don't remember those details.

Q. On the other hand, I understand that you do not deny that they might have occurred, but you have no recollection of them?

A. I have no recollection of them.

Q. In driving through the cherts, did he tell you that you could expect local smashing up of rock, falling out of rock and loose material, both where the rock was wet and dry?

A. I frankly believe he did not.

Q. That he did not?

A. I believe he did not.

Q. So that your statement is your present recollection is it was not made, as far as you know?

A. So far as I know it was not made.

Q. Did he further tell you there was some hope in driving through the Broadway Low Level Tunnel that you would not get as much water as you found in the Claremont Tunnel?

A. It is reasonable to assume that he did say that, but I don't remember that he said it.

Q. Did he tell you in that conversation anything about the Orindan formation? A. He did.

[841]

Q. In what he said to you, did you tell him, when he brought the statement up, that you did not

(Testimony of Lewis Michael Larson.)

need to discuss the Orindan formation with him, because you thought you understood the characteristics of that formation due to your experience in the Claremont Tunnel?

A. I doubt that I made that statement.

Q. Then there is nothing in the various items of conversation that I stated to you that you feel now at this time that you can remember as something that was said to you at the time of that conversation? A. No.

Q. What did Dr. Louderback say to you according to your recollection?

A. According to my recollection he stated that—we will deal with the Orindan first, because that is the subject mentioned—there had been some movement.

Q. Would you mind giving what you remember of the statement that you say he made? Would you mind starting at the first of this and go through with it, if you can? We had trouble, you remember, in going backward yesterday.

A. I will begin at the west end first. My recollection of the conversation was this, that "You will undoubtedly find some float material or hill wash over the west end of the tunnel, and on the Orindan side, there has been a movement of Orindan, but it is off the tunnel line. However I made a report on that." And to the best of my recollection, in fact I know it seems to me he meant why bring up something that you can get from the district? I

(Testimony of Lewis Michael Larson.)

have made a report on it and I considered that as terminating the conversation. That, in substance, is my best recollection, except this one thing he said, "There is an exposure of cherts," and I will try to repeat it as nearly as I can verbatim—"up on the Fish Ranch Road, this side o the divide, I would advise you to go and see that. My recollection is that it was used, at least [842] I have been told that it was used as a quarry or site of a quarry."

Q. When you say "my" that is in quotation?

A. As nearly as I can remember that conversation. "My information is that it has stood practically in the same condition for the last thirty-five years." Now, in substance, not in detail but in substance, I believe that covers the whole of the conversation with Dr. Louderback regarding the Broadway Tunnel, to the best of my recollection.

Q. You only saw him once?

A. I saw him only once that I have any remembrance of prior to the bids.

Q. That is the only thing that affects this?

A. Yes.

Q. It is true after the tunnel was under way and you were working there you saw Dr. Louderback frequently at the tunnel?

A. Yes, frequently.

Q. He was out there to see you?

A. Yes, frequently.

Q. You and he talked together numerous times?

A. We did.

(Testimony of Lewis Michael Larson.)

Q. But all that we are discussing now is the matter that misled you in connection with the specifications and in the preparation of your estimate. Now, this was sometime early in March and Dr. Louderback's report you had not seen at that time?

A. I had not seen it at that time.

Q. How did you come to go to see Dr. Louderback?

A. I had known Dr. Louderback for a number of years and I thought possibly I owed him a friendly visit, if nothing else.

Q. So that you simply called on him and while you were there, and you talked about this tunnel because you were interested in it, while you were there you discovered for the first time that he had made a report?

A. No. I did not discover it for the first time. I read that in the specifications, that there was a geological report, but I had not seen it at the time I saw Dr. Louderback. [843]

Q. A few moments ago you said if the District has it I will go and get it from the District, or something to that effect.

A. I would like to have my testimony read, if you misunderstood it.

Q. I do not think I misunderstood it.

A. I believe you are misquoting it.

The Court: Read the record.

(Record read by the reporter.)

(Testimony of Lewis Michael Larson.)

Mr. Tinning: Q. Did Dr. Louderback say "Why bring it up, I have made a report on it"?

A. He did not use those words, but that is the import that came to me. I could not exactly quote his words after this number of years, I am giving you my recollection of it.

Q. I did misstate you in my question. I understood when you stated "I" that you were referring to yourself. A. No.

Q. Why did you take Mr. Fontaine with you if it was a friendly visit?

A. Mr. Fontaine and I were to collaborate on the tunnel, that is, he was to give me the benefit of his advice, and whenever we made these inspections over the site Mr. Fontaine and I went together, with a view to discussing the different features, and at the end of this second visit I believe that I suggested, "Let us drop around to see Dr. Louderback, we are in the vicinity." And my recollection is we drove back over the same ground to the west portal and then around to see the Doctor.

Q. Then at the time that you saw the Doctor—you started working on this same estimate about February 27, I think you actually arrived in Oakland? A. I believe so.

Q. And this was a week or so along in March, and at that time you had not received from Mr. Orselli the copy of Dr. Louderback's report?

A. I never did.

Mr. Smith: There is no evidence he did. [844]

(Testimony of Lewis Michael Larson.)

A. I never received a report from Mr. Orselli.

Mr. Tinning: Q. From Mr. Calhoun?

A. No, I had not received it at that time, not at the time I visited Dr. Louderback.

Q. You are positive about that?

A. I am pretty positive about it, yes, very positive.

Q. The first time, then, that you were told that you might anticipate float or stream material at the surface of the west portal was when Dr. Louderback told you in his office? A. Yes.

Q. And you had been up to the site and inspected it? A. I had.

Q. You saw a terrace with growth on it, and you saw a stream running down to the south of the tunnel site, in fact I believe over where the south tunnel was later built, you saw all of those things, but you did not know that there would be stream float on that approach until Dr. Louderback told you?

A. I did not state that, that is an exaggeration; I did not expect much of it. My experience has taught me that there is float in every stream where a hill flattens out, that is where valleys are made.

Q. Later on when you read Dr. Louderback's report regarding this entrance under this mountain, driving underground, did you read the paragraph appearing at the top of page 14:

> "As at the surface of the ground only the weathering products are to be observed, before actually driving the tunnel through, the condi-

(Testimony of Lewis Michael Larson.)

tion of this formation along the tunnel line and depth to the top of the fresh, firm rock can be determined only by test holes or borings"?

A. I read the whole of his report for the pages that I mentioned.

Q. Did you make any test holes or borings?

A. I did not.

Q. There was a warning placed in that report before it was done, before the underground work was done it would be wise to do it, was there not?

A. It says, "The depth of the deposit can [845] be determined only by test borings. I do not think it refers there to being a wise thing for the contractor to do.

Q. Anyway, you did not do it?

A. We did not do it, no.

Q. And you had referred to this drift which was mentioned to Dr. Louderback, and which you have already said was entirely removed by the excavation for the portal building, and no portion of which extended into the tunnel proper.

A. That is correct.

Q. Now, in that you saw sandstone, and Dr. Louderback's report, what we have just read before refers to this, which says if they continue that they would be the kind of material you would find in the tunnel?

A. That is a proper interpretation of his report.

Q. And you did not find this continuing; when

(Testimony of Lewis Michael Larson.)

you graded out that tunnel for your portal buildings these sandstones were entirely eradicated?

A. I would not say entirely eradicated, but the firmness they showed in the tunnel was entirely eradicated.

Q. The layer of sandstone at the east end of that drift, which was not in the tunnel, at all, did that layer of sandstone continue on into the hill?

A. Toward the tunnel line, you mean?

Q. Yes.

A. My recollection is that it did for a distance, possibly, of ten or twelve feet, I mean running from the excavation made in the open cut and later.

Q. And did that run continue beyond the 10 feet into the place where the face of your tunnel was?

A. It did not reach the face of the tunnel; how far is only an approximation on my part, but to the best of my memory I know it extended about that distance, but did not reach the face of the tunnel.

Q. Then before you went underground at all you knew that the sandstones exposed in that drift did not extend in to where the tunnel was to be excavated? A. That is true. [846]

Q. You knew also before you went underground that the surface material adjacent to the open cut was slidy?

A. Yes, I knew it was not stable.

Q. You knew they were unstable? A. Yes.

Q. I believe your first tunnel excavation was

(Testimony of Lewis Michael Larson.)

made around the 1st of August, 1934?

A. I think you are correct.

Q. And by that time you knew that the conditions that you were to encounter in going underground were different than you stated you had assumed they would be? A. That is true.

Q. And you went on with the work?

A. I went on with the work.

Q. And you made no protest?

A. It was not my province to make a protest.

Q. You made none?

A. I made no protest, no.

Q. When you were traveling around on these inspection trips and during the observation that you and Mr. Fontaine engaged in in the spring of 1934 did you consult with the Safety Engineer of the Industrial Accident Commission of the State of California, Mr. C. H. Fry, regarding the gas conditions and what would be required?

A. I think it was Mr. Lowell, and Mr. Lowell called Mr. Fry into the conversation.

Q. And at that conversation with Mr. Fry Mr. Lowell was also present? A. Yes.

Q. Were you told that the type of formation through which this tunnel was driven would be particularly bad?

A. I have no recollection of it, and if I had been told that I would have placed Dr. Louderback as an authority ahead of the Industrial Accident Commission.

(Testimony of Lewis Michael Larson.)

Q. Will you state now that in 1934, when you were preparing your estimate, that you were not advised by Mr. C. H. Fry, Mr. Fred Lowell, Safety Engineers of the Industrial Accident Commission [847] of the State of California, and when you called upon them in their office with Mr. Fontaine, that the type of the formation through which this tunnel was to be driven was ground that was particularly bad?

A. I have no recollection of that conversation.

Mr. Tinning: Gentlemen, we have a copy of a letter sent to us by the Industrial Accident Commission under date of April 19, 1935, addressed to Mr. T. M. Price, Six Companies of California. We are perfectly willing to introduce our copy of this letter if you desire rather than ask you to produce the original. It will be stipulated that Mr. Price was the Project Manager at the time stated, will it not?

Mr. Marrin: You offer that. We are going to object to it.

Mr. Tinning: Not as to the form of the offer?

Mr. Marrin: No, we will not object to the form.

Mr. Tinning: Will it be stipulated that T. M. Price was Project Manager of the Six Companies?

Mr. Marrin: Yes.

Mr. Tinning: If your Honor please, we offer in evidence a letter dated April 19, 1935, addressed to T. M. Price, who it has been stipulated was the Project Manager of the Six Companies of Cali-

(Testimony of Lewis Michael Larson.)

fornia, by C. H. Fry , Superintendent of Safety of the Industrial Accident Commission of the State of California, attached to the letter being a copy of a report by F. L. Lowell, who was mentioned by the witness as being present at the conversation, and ask that it be marked "Defendant's Exhibit F."

Mr. Marrin: We object to the introduction of this letter, if your Honor please, upon the ground that it is immaterial, irrelevant, and incompetent, on the further ground that it contains statements or purported statements by the author, which are purely [848] hearsay so far as the plaintiff is concerned, and we suggest that if they desire to prove a conversation they call the author of the letter and not try to prove it by introducing a hearsay statement in the form of a letter to Mr. Price.

Mr. Alexander: We join in the objection.

The Court: State for the record the purpose of your offer.

Mr. Tinning: The purpose of the offer, if your Honor please, is to show that a conversation was had between this witness and Mr. Fontaine with the Industrial Accident Commission's Safety Engineer at a certain time, that it was with respect to the tunnel, and with respect to bad ground conditions at the time when this gentleman was preparing the estimate, and that this statement was sent to the Six Companies of California on April 19, 1935.

Mr. Marrin: If your Honor please, we submit that that is not a proper way to prove a conversa-

(Testimony of Lewis Michael Larson.)

tion. The proper way is to call the persons who were present and have them testify, so that they may be cross-examined. This is a voluntary statement apparently made by Mr. Fry more than a year after the purported conversation took place, the contents of this letter are purely hearsay, and we object to its admissibility for that purpose.

The Court: If the purpose is to bring knowledge home to the man of the making of the statement—I will not admit the conversation—if you eliminate the conversation I think it will be admissible, but not to prove the conversation.

Mr. Tinning: I understand that. The offer is made for the purpose of showing that he had the conversation.

The Court: Is there anything in the letter indicating the conversation had with the witness on the stand in this matter?

Mr. Tinning: Yes. The witness did not deny that he talked to him. [849]

The Court: I am concerned about the admissibility, and I am trying to keep the record straight.

Mr. Wittschen: May I make one further observation, not only that it is a letter directed by the Industrial Accident Commission to Mr. Price, the Project Manager of the Six Companies in 1935, in which he states that away back the year before he had warned this witness as to conditions, and he was continuing that warning during the time that they were driving the tunnel, which certainly is admissible on the main ground as to the knowledge

(Testimony of Lewis Michael Larson.)

of conditions, and the fact that they continued on for a year after they got the warning.

The Court: I will admit it for the knowledge at this time.

Mr. Marrin: Exception.

Mr. Alexander: Exception.

Mr. Tinning: It is on the letterhead of the Industrial Accident Commission, State Building, San Francisco, April 19, 1935.

DEFENDANT'S EXHIBIT F

T. A. REARDON, Chairman,
WILL J. FRENCH,
MEREDITH P. SNYDER,
Members.

State of California
Department of Industrial Relations
Industrial Accident Commission,
State Building,
San Francisco,
April 19, 1935.

Mr. T. M. Price,
Six Companies of California,
P. O. Box 120,
Berkeley, California.

Dear Mr. Price:

On April 15, 1935, F. L. Lowell, our Supervising Mining Engineer, before leaving for a

(Testimony of Lewis Michael Larson.)

trip to Mariposa County, called my attention to the conditions in your two Lower Broadway Tunnels. I am enclosing a copy of his memorandum.

You realize that it is the duty of the employer to take whatever steps are necessary to make his place of employment safe, and it is not the duty of the Industrial Accident Commission to do that.

For some time before the Six Companies bid on this project, we conferred with Mr. Larson and Mr. Fontaine and called to their attention the type of formation through which this tunnel was to be driven, and that the ground would be particularly bad, and that we were quite sure methane gas would be encountered. As we all know, the ground has been particularly bad from the start of the work.

Although I have not visited this project for some time, the information which I have received from various sources, makes me doubt the advisability of the type of excavating which is being done in the down-grade or north tunnel.

This matter should be given your serious consideration and every means known should be taken to prevent this ground from caving or running up in any way, causing conditions which would introduce the possibility of personal injury.

(Testimony of Lewis Michael Larson.)

Sincerely yours,
C. H. FRY,
Superintendent of Safety.

CHF:ES

C.C. Wallace B. Boggs, Dist. Mgr., 1448 Webster St., Oakland. [850]

[Endorsed]: Received Apr. 20, 1935 Joint Highway Dist. No. 13, Frank J. Burke, Secretary.

Attached to that is the memorandum of Mr. Lowell.

April 15, 1935.

C. H. Fry,
Lower Broadway Tunnels.

It is my opinion that the Lower Broadway tunnels should be given frequent inspection, at least twice a week. The ground in these tunnels is treacherous and the tunnels are high. At the present time the up-grade or south tunnel has broken into the chert formation which is loose and has a tendency to run. It has to be breast boarded in the two bottom side tunnels and considerable water is flowing from the chert formation.

In the down-grade or north tunnel, the top heading which extends down to the top of the first segment above the posts is timbered and lagged overhead and these timber segments rest on a wall plate that extends in ahead of the main face of the tunnel. When this top head-

(Testimony of Lewis Michael Larson.)

ing cuts the cherts, it will have to be close lagged not only on the top but the sides as well on account of the running condition of the chert formation. The main or bottom heading is about 27 feet high and at present consists of soft sandstone. It is the intention of the Six Companies of California to drill this high heading from a "Jumbo" or portable staging that can be hoisted up and down in front of the face. The face will be practically vertical.

These tunnels should be watched carefully and frequently by our Department in order that the Commission may be informed quickly of impending danger to the men. From our conference today I am informed that it will not be possible to devote the time necessary for as frequent inspection of these tunnels as I would like to make and at the same time carry on the routine inspection in the field. I am, therefore, leaving tomorrow for Mariposa County on my regular County inspections.

F. L. LOWELL.

[Endorsed]: Received April 20, 1935. Joint Highway Dist. No. 13. Frank J. Burke, Secretary.

[Endorsed]: N. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. No. F. Filed April 21, 1938. Walter B. Maling, Clerk.

(The letter was marked "Defendant's Exhibit F.") [851]

(Testimony of Lewis Michael Larson.)

(After Recess.)

Mr. Tinning: Q. Dr. Louderback's report,—going into the Claremont cherts formation,—called attention to the fact that you would go through layers of cherts, which are the brittle, hard rocks, and thinner layers of shale, including a layer of clay, shale, sandstone, volcanic ash, some of this limestone, which, I understand, you also encountered in the Claremont Tunnel—Is my understanding correct on that?

A. I think I encountered some of the limestone in the Claremont Tunnel. I am not a geologist. and—

Q. Well, Mr. Larson, you stated, yesterday, in looking at that document, when you passed out of the Orindan the first time into the lava, that you saw there a hard rock which was designated as a limestone? A. Yes.

Q. That is what you understood by Dr. Louderback's report: he states a layer of limestone—was it not—the type of material?

A. Today, I would put that interpretation on it, because I have not remembered the limestone referred to in Hulin's report. My memory brings it back to me that it was that. I had forgotten his remark about limestone. Consequently, I could not apply to any memory that I retained, at the time I read this, as being the same material.

Q. That was something in your own memory, then; you simply overlooked one of the characteris-

(Testimony of Lewis Michael Larson.)

tics that you had found as you drove through the Claremont Tunnel,—a small area there?

A. I had forgotten its presence in the Claremont Tunnel.

Q. You had not forgotten that volcanic ash that you encountered in the Claremont Tunnel, had you?

A. I had not forgotten that, Mr. Tinning; but I must say: volcanic ash, with water, is a different thing than volcanic ash, without water; entirely different; one will stand, and the other won't.

Q. When Dr. Louderback mentioned "volcanic ash," in his discussion [852] of the Claremont cherts, there was no qualification of the point we are discussing now, with respect to water—

A. Not at all; but I have always had to couple this with my own definition of what he termed these generalizations.

Q. You have told us that before.

A. Yes. I don't want you to forget it.

Q. When you were reading this report, and preparing this estimate, for the tunnel, of some two and a half million dollars, your memory did not refer back to your experiences in the Claremont Tunnel where you had gotten into volcanic ash?

A. I won't say I did not think of it; but I did not pay much attention to it, in view of what this geological report states this particular tunnel would be. That is the one I was dealing with.

Q. Although you had advice that volcanic ash

(Testimony of Lewis Michael Larson.)

might be expected in the Broadway Tunnel, you paid no attention to it?

A. No; because it would be self-supporting ground.

Q. Your generalities overcame the particular matters that were called to your attention?

A. Yes; because the Doctor had drawn the conclusion.

Q. You were relying wholly on him?

A. I have a great respect for Dr. Louderback's conclusions.

Q. Apparently. The strata of this formation intersects the surface at inclined angles; that is, they were steep? A. Yes.

Q. And it was called to your attention you could expect the same conditions that you had in the Claremont Tunnel, where you had considerable trouble in the cherts?

A. The trouble—I will say this—

Q. Will you answer "Yes" or "No"?

A. It is very—

Q. Will you answer "Yes" or "No"?

A. May I ask that the question be read? [853]

(Pending question read by the reporter.)

The Witness: A. No. I should say "similar conditions" rather than "the same conditions"—But may I go ahead with my qualifying statement?

Mr. Tinning: Q. Yes.

A. Since bringing that matter up, I have had occasion to delimit the amount of bad ground in the

(Testimony of Lewis Michael Larson.)

cherts, on my own report to Dr. Louderback; and I find that the extreme distance could not be more than 196 feet out of it, taking my own report.

Q. For the purpose of clearing up the record—You are going back to something we went into yesterday? Will you give us the data that you have referred to? Is it between stations? How do you arrive at your conclusion?

A. I arrived at the conclusion by taking my letter and referring to the number of sets, where sets are indicated; and, where sets are indicated, multiplying that distance. Now, if it happened to be 13 sets, by 4—which my letter indicated was the spacing of those sets—and 13 sets times 4 is 52 feet. I analyzed my letter.

Q. In other words, you took the data in your letter, and worked it out; and your testimony, today, at the present time, is that you have given consideration to the computation, based on the data from your letter, that there was 196 feet of what I think you call "bad ground in the cherts formation" in the Claremont Tunnel?

A. That would be the extreme limit; about 108 feet of that being breastboard ground.

Q. Dr. Louderback's report stated that these cherts are quite brittle and, when fractures did occur, produced in them by earth movement, it tended to remain open to allow the free movement of water. That was true in the Claremont Tunnel, wasn't it, where you found fractures?

(Testimony of Lewis Michael Larson.)

A. Not that I recall. My records on the [854] details of the tunnel are not too clear; that is, if I would run into a fracture, whether it contained a great amount of water or not, I am not in a position now to remember.

Q. But it is true you had places in the Claremont Tunnel, when you were driving through there, where you had fissures that would fall off as you went through the cherts,—one case, at least 30 feet above the tunnel, and filled the tunnel with broken cherts that ran out of it?

A. I have no recollection of that.

Q. You have no recollection of that?

A. No.

Q. How much water did you encounter, in gallons per minute, as you drove into the Broadway Tunnel, in the portion where you were in charge up to April 30, 1935?

A. I believe there was very little record kept. The amount was relatively small. I have, since joining the Six Companies in the preparation of this case, gone into the records and I have some; but I do not happen to have them available right here.

Q. While you were working in the driving here, up to the time you left on April 30, 1935, was there ever a flow of water, in the north tunnel, of, say, 200 gallons per minute? A. I believe not.

Q. It was a comparatively dry tunnel, was it not?

(Testimony of Lewis Michael Larson.)

A. It was comparatively; I will say "Yes," because I wish to qualify it: that very little water in a tunnel, under certain conditions, where the ground is fractured, might cause a great deal of trouble; whereby, a big volume of water, in other ground, might cause little trouble.

Q. You had five to six hundred gallons per minute of water in the cherts in the Claremont Tunnel, and you never had anything approaching that in the portion of this Broadway Tunnel that you drove? A. I did not, while I was there; no.

Q. Now, you stated that you expected to find cherts formations in [855] the Broadway Tunnel comparable, to some degree, at least,—and perhaps better than you found in the Old Low Level Tunnel? I am showing you Defendant's Exhibit "C," —photograph No. 10; which you remember you saw the other day, and which shows the cherts formation exposed on the south side of the Old Tunnel 430 feet in from the west portal?

A. I expected to find cherts as indicated in the position indicated there, where the laminations are close, where there are no cross sectional cracks that would cause a collapse, of any major amount, or even a small amount, of the cherts, because it was said to be self-sustaining; and, consequently, it could not, under any circumstance, slough.

Q. And that portion that is shown in that photograph was cherts of the character that you expected to find in the tunnel?

(Testimony of Lewis Michael Larson.)

A. There is a similarity.

Q. Yes. I will show you a photograph,—a view of the right-hand side of the down-grade tunnel—that is, the north tunnel, taken on February 15, 1936, at Station 124 plus 85, showing the area between 124 plus 85 and 124 plus 94; and ask you if that photograph is a fair representation of the type of cherts that you expected, when you looked at the Old Tunnel, to find when you drove through the Broadway Tunnel. A. No; it is not.

Q. What is the difference?

A. This shows that it lacks self-sustaining, self-supporting qualities, in some parts; it might be in the lower part of this photograph, where the laminations are unbroken; it is difficult to say. Now, just drawing a conclusion, from a photograph, that that portion might be sound—

Q. That portion shown at the lower part of the tunnel up to the wall plate, or up to the ventilator pipe, is about the same height as you found in the Old Tunnel, isn't it,—16 or 17 feet?

A. I believe that estimate is approximately correct. [856]

Mr. Tinning: We will offer the photograph in evidence, your Honor, please, as a defendant's exhibit.

(The photograph was marked "Defendant's Exhibit G.")

[Set forth in the Book of Exhibits at page 358.]

(Testimony of Lewis Michael Larson.)

Mr. Tinning: Q. I show you a photograph taken in the north tunnel—

Mr. Smith: Which is the top of the photograph?

Mr. Tinning: This is taken of the roof of the tunnel, your Honor; and, by holding the bottom of the picture away from you, you will see it.

Q. I will ask you to observe that photograph, Mr. Larson; and ask you if the chert disclosed, on the north side of the roof of the tunnel, which is standing unsupported after several sets were shot out of the roof of the tunnel— if that is the kind of cherts you expected to find in the tunnel, after your observation of the Old Tunnel.

A. I believe not, Mr. Tinning. I think I see there,—not too surely, though—I think I see a fractured zone, whereby the formation of the laminations have been broken. It is difficult to say—to take this picture, and make any definite conclusion—draw any definite conclusion, excepting the one that apparently is evident; that it needed support, because the support is there; and I notice the lagging is relatively close. Apparently it is a broken formation, rather than a self-supporting one.

Q. I will ask you to look at the spacing. How long are the segments that form the boundary of this rock that is hanging down from overhead?

A. I would have to ask others about that. I would assume somewhere between 6 and 7 feet.

Q. So, you have a piece of rock hanging, or un-

(Testimony of Lewis Michael Larson.)

supported, in the roof of the tunnel, at least 6 by 6 feet?

A. It looks to me like part of it has fallen out.

Q. You think some of it has fallen out?

A. It looks that way, from [857] the photograph.

Q. And you, not being there, never saw this particular condition?

A. No; I had not seen it. I have not seen any of the cherts in the Broadway Tunnel.

Q. Would you say the section between those two rocks,—the double timbered segment which appears near the top of the picture and the first single rock, as you go further into the tunnel,—some 9 feet space in there—that there is anything supporting that roof at that point?

A. Yes, Mr. Tinning, there is.

Q. Is it the lagging?

A. The lagging or spiling,—whichever it is that they use there,—gives artificial support.

Mr. Tinning: We will offer this photograph in evidence as a defendant's exhibit.

(The photograph was marked "Defendant's Exhibit H.")

[Set forth in the Book of Exhibits at page 359.]

Mr. Tinning: Q. I show you a photograph taken February 15, 1936, showing the timbering on the south side of the down-grade tunnel, taken showing the section at Station 125 plus 53, and I will ask you to look at the cherts appearing below the wall plate in that portion of the tunnel; and ask you if it is

(Testimony of Lewis Michael Larson.)

similar to the material that you saw in the Old Tunnel.

A. Some portion of it is, Mr. Tinning.

Q. And the strata lie at about the same angle?

A. I believe so.

Q. So, it apparently is part of the same general formation?

A. Same general belt.

The Court: What would the distance be?

Mr. Tinning: Oh, I should say, five to eight hundred feet. That is a pretty wild guess, I am afraid.

The Court: Well, I just want to follow it; that is all. I understand.

Mr. Smith: You mean between the two tunnel-

[858]

Mr. Tinning: Between the two locations. This was pretty well toward the east, in this——

Mr. Wittschen: You mean toward the north?

Mr. Tinning: To the north, yes. We offer this picture in evidence, your Honor.

(The photograph was marked "Defendant's Exhibit I.")

[Set forth in the Book of Exhibits at page 360.]

[859]

Q. Now, it is true, is it not, at least in the portions of the tunnel that you had to do with, that there was no gas or any serious amount of oil encountered?

A. I don't remember any at all, Mr. Tinning, either gas, or any great amount of oil.

(Testimony of Lewis Michael Larson.)

Q. So that was one problem you did not have in the tunnel which Dr. Louderback stated you might have, and you did not have? A. That is true.

Q. In preparing your estimate I assume that you had that in mind, that you might have to meet that condition? A. I made provision for it.

Q. You were not in the tunnel when the cherts was intercepted or when you drove into the cherts?

A. Not the cherts belt that Dr. Louderback says in his report; this cherts that I have been taking as cherts was merely my own idea of what might have been cherts, the laminations that I discussed in the early part of my testimony.

Q. Dr. Louderback made some predictions as to where various formations would be met as to distance in the stations. Have you gone over those in his report?

A. I went over them in the sectional drawing, I think it refers to it here in the report; in fact, my recollection is that he mentioned between stations 118 plus 50 and 119 plus 50, or thereabouts.

Q. That is just about——

A. That would be the fault line, that is probably where we would enter it.

Q. That is where it was struck, is it not?

A. Very close.

Q. Likewise when you had passed out of Claremont cherts into Orindan formation at Station 131 or 132, also that formation was struck at the position that he indicated within a few feet?

(Testimony of Lewis Michael Larson.)

A. From the company's records I draw that conclusion, yes.

Q. You have been working on this whole matter so that is something [860] we can at least be definite upon, his predictions as to the points were very accurate? A. Were very close.

Q. You understood that when you went through the fault zone, the Wildcat fault, that you would expect to have considerable difficulty in driving this tunnel, didn't you?

A. Some difficulty, yes, Mr. Tinning, but I would like to say this, it was expected much less water would be encountered, consequently much less trouble.

Q. Dr. Louderback, in his report, did not attempt to predict the quantity of water with definiteness, he said that it could be hoped there would be less water? A. Yes.

Q. And except for water which would drain quickly, apparently the ground water that was stored when you went through that fault, your water conditions were a temporary matter and that turned out to be a fact, that the quantity of water rapidly dropped just as it did in the Claremont Tunnel?

A. Yes, together with the fact that he thought that there was probably a continuation of the Wildcat fault, which led me to believe, and possibly I am right in believing that, in having passed through the fault—I cannot say—but much of that water that was in the fault of the Broadway Tunnel would find

(Testimony of Lewis Michael Larson.)

its way into the Claremont Tunnel, which was nearby, and at a much lower level. That was my thought in the matter in reading his report.

Q. In other words, you connected the two tunnels together as to underground strata and you thought perhaps the Wildcat fault had drained off some of the water that you would have found in driving the Broadway Tunnel if the Claremont Tunnel had not been built several years before; is that what you mean?

A. I mean this, we left pipe in the lining of the Claremont Tunnel whereby the water from a higher elevation could enter the tunnel; [861] it was found to be practically chemically pure and the utility district wished to take that water, and it seemed reasonable for me to assume that much of the water from the Broadway Tunnel might find its way down there and leave the Broadway Tunnel as the Doctor predicted, with the hope that there would be less, and that hope was probably influenced by his belief.

Q. It is about a mile from the Broadway Tunnel No. 1 on Defendant's Exhibit B to the Claremont Tunnel, and you thought that the water in the ground rock below the Broadway Tunnel might be drained out by the opening in the Claremont Tunnel, so that you would not have so much water to contend with?

A. I thought that was entirely possible.

Q. Doctor Louderback did not say that?

A. No, he did not.

(Testimony of Lewis Michael Larson.)

Q. That was your conclusion?

A. That was my thought in trying to interpret his remarks that probably less water would be found.

Q. You do not claim that he misled you in that respect?

A. No, I do not. As a matter of fact, I believe there was less water. I can support the doctor in that.

Q. He also told you that this fault had caused more or less shearing and displacement along subsidiary fractures with rotation of minor blocks and crushing in certain areas, and that after you passed Station 120 plus 00 that he thought the cherts formation would be likely to be remarkably regular?

A. Yes.

Q. Now, according to your testimony respecting the Claremont Tunnel, you also had a like situation in the Claremont Tunnel, near the areas at the fault zone and as you passed in, after a few feet, as you said I think this morning, possibly 190 feet, your conditions improved, you got good ground.

A. I made mention this morning that 196 feet covered practically [862] all of the bad ground, according to my letter.

Q. You also stated there was about 120 feet of bad ground beyond the point where you made this barrel or concrete lining to take care of swell and fire, and then the balance of this 70 feet was spread out somewhere in layers or zones as you went far-

(Testimony of Lewis Michael Larson.)

ther east in the cherts; is that a fair statement?

A. Yes. I will say to my recollection that they were close to the major fault. That is my recollection.

Q. That is exactly what I was trying to refer to in his saying that you might expect to find subsidiary fractures with rotation of minor blocks and crushing in certain zones, as you passed from the west end toward the east, and that after you got past station 120 going toward the east that the structure appeared to be remarkably regular, although there are present some minor faults and crushed zones. That is what was found in the tunnel, is it not?

A. I am really not in a position to say positively. I have heard that they found a crushed area, I have heard that there was none of it self-supporting.

Q. You have told us that none of the tunnel was self-supporting.

A. Keeping in mind that I am speaking now from hearsay and not observation.

Q. You are testifying in a dual capacity here, as I understand it, as a tunnel expert, on the one hand, and you are changing over to testify to facts, and you testified as an expert that there was no part of this tunnel that was self-supporting.

A. That is my understanding.

Q. That is your testimony? A. Yes.

Q. Now, then, Dr. Louderback, with respect to the cherts, and the matter that I have just referred

(Testimony of Lewis Michael Larson.)

to, predicted that you might expect zones of crushing in the cherts.

A. Yes, if you limit [863] it to his general statement.

Q. Or to his specific statement, and your lode star is the general statement at the end?

A. Where he said it would be self-supporting.

Q. But as you read this report you saw these words, "although there are present some minor faults and crushed zones"?

A. I saw that, and then turned to his definition of what that was.

Q. You ignored the specific and went to the general?

Mr. Smith: He did not say ignored.

A. I did not ignore it, but it helped me put the interpretation on those general remarks.

Mr. Tinning: That means that you eliminated the specific and accepted the general?

A. No, I should say Doctor Louderback eliminated them.

Q. That is your conclusion?

A. That is my conclusion, and that is what I understood in his report.

Q. What did you do?

A. I concluded the formation from his conclusions, which stated that the ground would be self-supporting.

Q. And in taking his generalization you elim-

(Testimony of Lewis Michael Larson.)

inated the provision that we have just referred to on page 15 of the report?

A. In very large measure I relied, almost entirely, I might say, on Dr. Louderback's conclusions.

Q. You did not accept as a warning in arriving at those conclusions what he specifically says, "although there are present some minor faults and crushed zones"?

A. He had eliminated them and consequently I eliminated them.

Q. In other words, that is your interpretation that you eliminated them?

A. That is my understanding of the specifications.

Q. And upon that kind of an understanding you prepared your estimate on the basis of this tunnel being all in self-supporting ground?

A. Within limits—within the limits that Dr. Louder- [864] back stated.

Q. "The fault zone will be occupied by broken and possibly crushed cherts." Did you eliminate that? A. No, I did not.

Q. Did you eliminate his statement that driving through the cherts that the combination of crushed zones and water presented difficulties?

A. Might I ask you what you are referring to?

Q. I am referring to the top of page 16, but I am paraphrasing now.

A. Might I ask this, it is hard to follow. This refers to the fault zone, doesn't it?

(Testimony of Lewis Michael Larson.)

Q. The fault zone was referred to on page 15. Now we are coming to another paragraph on the top of page 16.

> "In driving through the cherts, the combination of crushed zones and water often presents difficulties. The crushed rock (with or without water) may flow out into the tunnel almost like quicksand, or, if it holds together better, it may develop considerable pressure until the water pressure is relieved by free flow into the tunnel."

Did you consider that in arriving at your opinion that this tunnel would be self-supporting throughout?

A. I did to this extent, Mr. Tinning, that often presents difficulties; he did not state that this tunnel would present difficulties, as I understand it, but he said in driving through cherts water often presents difficulties. That, to me——

Q. (Interrupting): You did not think that he was talking——

Mr. Smith: Just a minute: He was right in the middle of a sentence.

A. Is a general statement of what might be found in the cherts formation, which was limited in terms by his own conclusion, his own definition.

Mr. Tinning: Q. That was your own conclusion in reading this [865] report?

A. That was my conclusion.

(Testimony of Lewis Michael Larson.)

Q. You thought that this was a general statement, and that the final statement was the specific statement with respect to this tunnel?

A. Yes, that he had made his own definition of his generalization, and made a specific statement.

Q. I will go down two sentences.

> "In certain cases where a broken or crushed mass of rock lies within intersecting fault planes, and thereby loses its bond to surrounding rock, it may slump down into the open working, leaving a chamber in the wall or roof."

Do you mean to say that you thought that was referring to what might occur in some other tunnel rather than in the Broadway Tunnel?

A. I considered that as a general statement of things that might be found in cherts, irrespective of any particular tunnel, a general condition that he had observed, and I can readily see he thought of other tunnels as well as the Broadway Tunnel.

> Q. "If this is experienced at all in the proposed tunnel it will probably be in the southwestern fault zone mentioned above. If such unsupported blocks or masses are met, it would probably be best to let them down or remove them, before placing the concrete of the completed structure."

That was a specific recommendation that that condition was met with in this tunnel? A. Yes, if.

(Testimony of Lewis Michael Larson.)

Q. Did you in preparing your estimate, consider that recommendation if that condition was found?

A. No, let me explain. In my method of driving I had prepared to meet a condition where it would not be necessary in my judgment to let down masses of material. I intended to give support by the timbers that I indicated in my plan of operation.

Q. Do you think that the full face method of excavating which you indicated as your proposed method would hold blocks in the [866] roof?

A. The full face method is intended to be in ground that is self-supporting and in that case there would be no reason to prevent blocks dropping out of the roof; otherwise it would not be self-supporting ground.

Q. But still you did not plan to go to the full face method until you got into the cherts?

A. Not until I got through the fault zone of the cherts.

Q. You did not say that. May I see Plaintiff's Exhibit 27, please? The shaded areas indicate tunnel sections where permanent timbering was anticipated?

A. Yes, but a provision was made in the specifications in addition to that, an estimate of 100 feet of the Type B for each of the two tunnels, and in addition to that 100 feet of liner plate, or, in other words, I made provision in my plans or in my estimate to take care of approximately 30 per cent. of the tunnel whether necessary or not, for ground that

(Testimony of Lewis Michael Larson.)

would not be considered self-supporting, and the other 70 per cent. would be every such point which would probably be a little in advance of the broken formation, but within a few feet of the east portal.

Q. Then this diagram, Plaintiff's Exhibit 27, where the legend says the shaded areas indicate tunnel sections where permanent timbering was anticipated, did not represent the exact section where you planned to leave permanent timbers, but was simply a statement of quantity?

A. A statement of quantity would be more nearly accurate.

Q. Then when you testified that your section BB and your section AA, as shown in Plaintiff's Exhibit No. 27 were the sections in which you proposed to maintain permanent timbers you did not mean that they would occupy the first 760 feet of the tunnel, as you testified?

A. Let me make that clear. I will first of all say no. [867]

Q. Your answer is "No"?

A. No. The grouping together of the points that needed support in so far as an estimate is concerned, for convenience in the estimate, was brought together to cover the distance indicated there, coupled with a possible additional hundred feet of liner plates, and an additional hundred feet—I am speaking now of the individual tunnels—of the type B section, which seemed to be an ample safeguard

(Testimony of Lewis Michael Larson.)

against any condition that might arise in ground not self-supporting.

Q. Then it is your testimony now that the 720 feet of Section BB shown in your exhibit 27 was not intended to occupy the first 720 feet after you left the 110 feet of lining in the north tunnel, but was to be scattered throughout the tunnel at any place that it might be required?

A. That is true, if necessary—if necessary.

Q. But isn't it a fact that when you testified you said that it was to keep that first 720 feet of the wall plate drift?

A. If I did, Mr. Tinning, the thought was for estimating purposes.

Q. Isn't it true that this exhibit shows the timbering in the east portal, in the 20-foot range that you referred to, and shows the permanent timbers, which you said were about 40 feet, and also 720 feet to the Wildcat fault?

A. In addition, yes, an additional 720 feet to 60 feet, adding the east and west timber section; that amount of timber I estimated in getting the bids ready.

Q. Isn't it true that this note says, "Shaded areas indicate tunnel sections where permanent timbering was anticipated"?

A. In the estimate, yes, but not in the thought back of the estimate.

Q. Are you going to change from full face to drift as you went through this tunnel?

(Testimony of Lewis Michael Larson.)

A. If necessary. I did not contemplate it would be necessary because Dr. Louderback said it was self-supporting.

Q. If it was not going to be necessary why were you going to require permanent timbers after you left Wildcat fault? [868]

A. As a precautionary measure; I did not say I am going to use them; the way I answered you was, my thought was just as Dr. Louderback stated, I included liner plates, I included the Type B section, but I did not say I intended to use it; it was merely a precautionary measure added to make my estimate safe.

Q. But it is a fact, is it not, if you desired to use permanent timbers or heavy materials, you would have to have some method other than the open face method to drive through? A. If, yes.

Q. If you found them? A. Yes.

Q. And you included that "if" in your estimate, didn't you? A. I don't know that I did.

Q. Mr. Larson, isn't it a fact that you anticipated no change in the method that you proposed in driving this tunnel from the time you left the point at 760 feet past the west portal until you arrived 20 feet from the east portal, you planned to drive a full open section?

A. That is approximately correct, Mr. Tinning, I won't say you are limiting it correctly, 760 feet may not be, but if you subtract 30 per cent. from

(Testimony of Lewis Michael Larson.)

the total length of the tunnel and put it all together in one group, then you have the correct answer.

Q. You say that I did not state it correctly. I am stating exactly what is shown on your diagram and to which you testified, am I not?

A. I believe you are.

Q. So I have stated it correctly.

A. You have stated it correctly as you understood it, yes.

Q. You are now qualifying what was shown on your diagram some week after you testified to it by saying that the shaded area did not represent where you expected to put permanent timbers, but that you expected to put permanent timbers at places where and if it became necessary. That is correct, is not?

A. To a certain [869] extent, yes, it is correct, but I am speaking of my estimate and the grouping for the purpose of making my estimate understandable and simple to people for whom I was working. My thought, as I said before, is that there would be about 70 per cent. of this tunnel in the continuous, without any change being necessary from the full face system, and that the timber that is indicated there is largely precautionary in amount.

Q. Mr. Larson, I wonder if you will look at Exhibit 27 and look at Section CC, full faced cherts 10 feet round, Orindan five feet round, timbering 12

(Testimony of Lewis Michael Larson.)

by 12, set on 5-foot centers, re-used timber three times, total use 4. A. That is correct.

Q. Now, your full faced operation as set up was a case when you passed Wildcat fault and continued until you struck the east portal?

A. Approximately.

Q. And when you were driving through the Monterey Sandstone you were using a wall plate for ground that was heavier than your anticipation, that the cherts required more support, and in that section of 720 feet you were planning to leave all of the timbers, if required, and there is nothing on your diagram that indicates that you proposed to leave any permanent timbering anywhere after you left the Wildcat fault?

A. I did not intend to, except as I testified to in my earlier statement for the purpose of the protection of the men who might be working under, to leave spiling in and carry that spiling down, the piling support down.

Q. We are talking now about the 12 by 12 timbers shown on Section CC, which you were going to use four times, and that was all in the cherts?

A. In the cherts and Orindan.

The Court: We will take a recess now until two o'clock.

(A recess was here taken until two o'clock p. m.)

[870]

(Testimony of Lewis Michael Larson.)

Afternoon Session,
Thursday, April 21, 1938,
2:00 o'Clock P. M.

LEWIS MICHAEL LARSON,

Cross Examination (continued)

Mr. Tinning: Q. Mr. Larson, in preparing your estimate, did you have in mind the provisions of the certain paragraph on page 16 of Dr. Louderback's report, in which he says:

> "Based on experience gained from other tunnels in the cherts, and judging from long exposed steep quarry faces in the same formation, it may be expected that after driving, and after the material in the immediate vicinity of the tunnel has come to equilibrium, the rock will stand well and need no support"?

A. I knew of that; and I had read that conclusion, and gave it consideration, as I understood the report. In this particular instance, it would refer, in my judgment, more particularly to the faulted zone.

Q. Well, the Doctor refers to the faulted zone, in the next sentence of the paragraph, doesn't he?

A. He refers to the faulted zone, in the next sentence.

Q. But you took the preceding sentence, then, in your consideration, as referring only to the faulted zone?

(Testimony of Lewis Michael Larson.)

A. The reason of my doing that, Mr. Tinning——

Q. Well, will you answer "Yes" or "No," and then explain?

A. May I have the question repeated?

(Pending question read by the reporter.)

The Witness: A. Yes, chiefly.

Mr. Tinning: Q. Then, the following, or third, sentence in the paragraph:

> "Even the part in the fault zone is likely to stand well after the driving through it is completed. This was the experience in the [871] Claremont Tunnel."

Do you still believe the first sentence refers only to the portions of the tunnel material adjacent to the tunnel in the immediate vicinity of the faulted zone?

A. Yes, I do, in view of his conclusion.

The Court: Just so I may find myself:

Q. You refer repeatedly to "conclusions." What is that?

A. That is on page 18, your Honor.

Q. Under the heading "Tunnel in General"?

A. Yes, "Tunnel in General."

Q. That consists of pages 18 and 19?

A. No. 18, only.

Q. Page 18, only? A. Yes, sir.

Mr. Tinning: 19, your Honor, deals with the outside.

(Testimony of Lewis Michael Larson.)

The Court: Yes. He referred to the conclusions, and I was looking them over; and they are labelled here "Tunnel in General." That is all I wanted. I just wanted to locate what he had in mind. You may proceed.

Mr. Tinning: Q. Now, passing to the "Orinda Formation":

> "From about Station 130 (as judged by surface dip, but it may be farther along in the tunnel as the dip may steepen underground), to the east portal of the proposed tunnel, the bore will be entirely in the Orinda formation—— This formation consists of a series of alternations of beds of consolidated gravel, clayey sandstone, and sandy clays, which were laid down as fresh water deposits."

When you passed through the drift running from the east portal westerly toward the west in the tunnel, in your inspection made about September of 1935, did you observe the formation that were passed through by these drifts? A. Roughly.

Q. Would you say that they are predicted by Dr. Louderback's report?

A. My conclusion, drawn at that time—it was two or three months, I think, after they were driven —was that the formation was not so [872] firm as the Doctor had intended to convey in his general conclusion.

(Testimony of Lewis Michael Larson.)

Q. Now, Mr. Larson, we are discussing these specific statements made under the heading "The Orinda Formation," on page 16; and particularly directing your attention to the portion thereof which states:

> "This formation consists of a series of alternations of beds of consolidated gravel, clayey sandstone, and sandy clays——"

Were the materials described in this paragraph, in general, the type of materials that were penetrated by the drifts referred to in my earlier question?

A. Yes, particularly in this sentence you have just read.

> Q. "Tunnel driving is generally rapid in the sandstones and clays, somewhat slover in the gravels, which are naturally harder on drill steel. The formation usually breaks rather blocky and often develops a certain amount of overbreak."

Now, yesterday, in your testimony regarding the Orindan formation in the Claremont Tunnel, I understood you to say that, when you got in the gravels, you found, as Mr. Hulin had predicted, the gravel would be hard on drill steel?

A. That is correct.

Q. In other words, it was harder to drill?

A. Yes.

(Testimony of Lewis Michael Larson.)

Q. From your observation of the material in the Broadway Tunnel, made at the time when you went through those drifts, or any other knowledge that you obtained, would you say that Dr. Louderback's report deviated from what was actually encountered in the Orindan formation?

A. Not as to the method in which the material was laid down, nor the different kinds of material that would be encountered; but I concluded that the firmness that was intended by the remarks of Dr. Louderback on the Orindan formation were not as firm as he intended to convey.

Q. Well, is there any statement in what I have just gone over with [873] you, regarding the Orinda formation and firmness? A. Not yet.

> Q. "Water and its Effects." "Water is usually in very slight amount in the Orinda formation, coming in along certain gravels and coarse sands, or seeping along minor faults or shear zones. Most of the formation is likely to be dry."

Did you notice, when you went over those drifts we have been referring to, whether or not there was any considerable quantity of water?

A. I did not see any considerable quantity.

Q. In other words, the Doctor's predictions that these are likely to be dry were pretty well borne out by the facts, weren't they?

A. At the time the trip was made, there was a little mud in the immediate vicinity; but it was

(Testimony of Lewis Michael Larson.)

impossible for me to tell just the source of that, whether that came from drilling with the use of wet jack hammers, or whether it was from any cause, I was unable, at that time, to determine, or at least I did not go to that point; it was not necessary for me to try to determine the source.

Q. Well, there was no considerable quantity of water there? A. Very little of it.

Q. You encountered water in various stations in the Claremont Tunnel, in going through the Orinda, didn't you?

A. In the cemented gravels, we would encounter water, in the Claremont Tunnel; and when we shot the round, there was no evidence at all of water; where the water went to, I am still unable to say; it disappeared entirely.

Q. One of the mysteries of tunnel excavation?

A. One of the mysteries of tunnel excavation.

Q. Would you say the water in the Claremont Tunnel was comparable with that you saw in the Broadway Tunnel, in the Orindan?

A. My recollection, now, Mr. Tinning, is that there was more moisture in these drifts to which you are referring, in the Broadway [874] Tunnel, than we encountered in any portion of the Orindan formation in the Claremont Tunnel.

Q. Well, I will just call your attention to your testimony regarding the swelling ground that you encountered in the Orindan. We went over it yesterday: The Claremont Tunnel, about 500 feet be-

(Testimony of Lewis Michael Larson.)

fore you reached the limestone and the lava— Do you remember that section?

A. I remember that section.

Q. There was plenty of water there?

A. I think there was not one drop.

Q. No drop?

A. I don't think there was one drop in that whole section that you are speaking of. You are speaking of the swelling ground section, now, aren't you?

Q. Yes.

A. I think there was not one drop.

Q. In the Orindan, in the vicinity of the swelling section, wasn't it a fact there was water that dripped out of the opening, after it was excavated, and had to be carried away?

A. Not that I have any recollection of.

Q. What about this stuff that mucked like wool, you said, when it was wet; you said it was resilient?

A. That was in the immediate vicinity of the change of formations, from the Orindan and what we have determined to be the limestone, before we struck a little water there.

Q. Then, it is your testimony that, after you got away from the immediate effect of the fault at the edge of the cherts, when you passed into the Orindan and got into what was the better Orindan, that it was substantially dry?

A. I have no recollection of any water excepting

(Testimony of Lewis Michael Larson.)

what I have enumerated in the conglomerate, which disappeared, as I have stated.

Q. The conglomerate is one of the component parts of that Orindan? A. Yes, it is. [875]

Q. Possibly there was water in that portion of the tunnel?

A. Possibly there was water in that portion of the tunnel when we drilled, or when we shot.

Q. Did you see any gravel in the Broadway Tunnel when you passed through those drifts?

A. I believe I did. My recollection is not too clear on that, but I think I found gravel formation there.

Q. In other words, as you passed through the Orindan you found the typical Orinda formation?

A. I think I did.

Q. Gravel, Orinda, or strata; then——

A. If you leave the water out, yes, because I am not competent to say whether that was present in the formation or not.

Q. Did you consider this:

"While these sandstones and clays are naturally mostly dry, they are generally affected by contact with water. In fact they are sensitive to both drying and wetting, and a chunk removed from underground and exposed above ground usually cracks and slacks in the sun, and breaks down into a soft clay or mud in the rain. While the beds are firm, and when dry stand well underground, they carry but little natural

(Testimony of Lewis Michael Larson.)

cementing material, except in occasional layers. These cemented layers remain firm even on exposure to sun or water."

Did you consider that? A. I did.

Q. Did you consider that it is firm and stands well when protected from water action and air slacking? A. I did.

Q. Did you consider what Dr. Louderback stated in his report, on page 17,—that it was likely, in this Broadway Tunnel, that you would not encounter as much water as you had at the lower elevation of the Claremont Tunnel? A. I noted that.

Q. Did you have in mind, in your proposed method of construction, to set up protection, if you thought you would, during construction, encounter the Orinda formation,—water in the Orinda formation that [876] might come from other parts of the tunnel?

A. I did. We were supposed to be driving from the west end; and it would be difficult for water to come up a 4 per cent grade and come into the Orinda formation even though it was actually present in the cherts or any other formation that lay farther downgrade.

Q. Were the east portal portions of the tunnel excavated in any respect when you left on April 30, 1935?

A. I believe, about 30 feet; I am not sure as to the extent; but, from going through these Company records, it is my conviction that somewhere in the

(Testimony of Lewis Michael Larson.)

vicinity of 30 feet had been excavated in addition to the ground necessary for the erection of the portal building.

Q. Which was not in the tunnel proper; it was an open cut where that building was built?

A. That is true.

Q. Did you observe that area just before you left? A. No; I did not.

Q. You saw it, of course, when you came back at the end of August?

A. Yes, I saw it at that time.

Q. Did you observe the condition, then, at the east portal drift, or the east portal of the tunnel?

A. Rather roughly. My interest lay in the inspection of the drifts rather than the outside. The outside seemed to be secure. I could not tell you what the real conditions were in the open cut.

Q. Could you tell us what the conditions were within, say, approximately 30 feet, on the tunnel ring that you saw was excavated there?

A. Only in this particular: that it seemed to be safe; the timber was holding.

Q. In other words, it was timbered?

A. It was timbered.

Q. And had been, because your impression is there was about 30 feet of excavation there when you left at the end of April—it had been, [877] for three or four months, timbered and left open to slacking effect of the air, or any water, that might get into that pit?

(Testimony of Lewis Michael Larson.)

A. I believe that would be undeniable.

Q. Dr. Louderback's report, as we have just said, particularly calls attention to the desirability of preventing air slacking or water effect on the Orindan?

A. Yes. Of course, I don't know just what degree—what I mean by the time element—how long a period he had in mind.

Q. Referring to the tunnel, in general, when you say that you have made this your cardinal principle, or the basis of your conclusion of what Dr. Louderback meant, did you mean to say that you understood that this applied to the entire length of the tunnel,—the generalization?

A. I think that it refers more particularly to the Orindan and the cherts sections.

Q. As a matter of fact, in the second paragraph of the generalizations, does not Dr. Louderback say:

> "Throughout the main belt of cherts, the rocks may be expected to be entirely self-supporting indefinitely; in the fault belt of cherts and in the Orindan, with proper care in driving and handling, the rocks should stand well and be self-supporting except possibly along certain shear zones which may require local reenforcement to withstand local pressure (not general weight)."

I understood you to say that, from reading these paragraphs that make up the generalization, you

(Testimony of Lewis Michael Larson.)

concluded that, through the major portion of the tunnel, the material would stand indefinitely, without any support, against great pressure?

A. I think that is— Yes; I will say, I think that is the importance of that.

Q. That was your interpretation? A. Yes.

Q. In other words, that in a tunnel which, as you examined the plans, called for a permanent lining of reinforced concrete 2 feet [878] in thickness at the crown and 5 feet at the base, you assumed that no permanent support was required to hold up the mass of that mountain above that tunnel?

A. Yes; I assumed that Dr. Louderback had stated that; and, of course, I must qualify that by saying that was not intended for 100 years. My interpretation would be during the construction period. I also say it was a proper construction to line tunnels, whether the rock is self-sustaining or not, with the spilings; and, in addition to that, that you have to be careful. I could not conclude, from the concrete lining, that Dr. Louderback's conclusions were wrong, as I understood them.

Q. Did you conclude that the design was unnecessarily heavy?

A. I gave no thought to that at all. That was not my function.

Q. You gave no consideration to the fact that it appeared on these plans that a lining 5 feet in thickness at the base and 2 feet in thickness at the top, with reinforcing, by the provisions in the specifica-

(Testimony of Lewis Michael Larson.)

tions that permitted the District Engineer to add whatever steel he thought was necessary and pay you your bid price for it; you did not give any consideration that that might be a lining to be placed in this tunnel, which you say you thought was going to be, in the main, self-supporting?

A. Yes; I assumed that that lining would be placed there, because the plan specifically stated it would be; but I did not conclude that had anything to do with the construction feature or the ability of the ground to stand unsupported during the construction period. The other was construction detail, and in the mind of the Engineer; and whatever had influenced him was not my function to try to decipher, nor the amount of reinforcing, nor the amount of concrete, nor the reason therefor; it did not influence me to stop. The conditions were different from those specifications or express statements, as I understood them, in Dr. Louderback's general conclusions. [879]

Q. Then, as you understood the general conclusions, you eliminated all that had been said before, you eliminated all that had been shown in the plans and specifications, with respect to the thickness of the lining that was to be placed in the tunnel?

A. Yes; with regard to the thickness of the lining that was to be placed in the tunnel, because it, in itself, did not differentiate in any particular location; but I must recall, again, that, in the specifications, there is the requirement for special permission

(Testimony of Lewis Michael Larson.)

to leave the timbers in. If it were there, if it had been placed there for construction purposes, it must be taken out, indicating a conclusion, the same as I had drawn, in Dr. Louderback's report, that, in the main, it would be self-supporting ground, or in construction. That was my interpretation.

Q. You thought the specifications were attempting to predict the conditions that would be encountered in the ground?

A. I thought the specifications were attempting, or were influenced by a thought similar to my own: that the ground would be self-sustaining during construction.

Q. Now, as a matter of fact, this very statement that we have been over, says that, in the fault belt of the cherts and Orindan, with proper care in driving and handling, the rocks should stand well and be self-supporting except possibly along certain shear zones which may require local reenforcement to withstand local pressure, not general weight. You understood from that, did you, that you would, at certain places, expect to find problems that you would have to meet, in driving this tunnel; you would have to support that in some way, as you went through?

A. I did; and I made special provision for that, by timbering it at 5 foot sets all the way through the tunnel, and removing that timber only when the concrete was brought up. [880]

(Testimony of Lewis Michael Larson.)

Q. This statement at the conclusion of the report following the title "Tunnel in General" is what you base your statement upon, or what you based your assumption upon that you would find throughout the tunnel the majority of the tunnel rock which required no substantial support in construction? A. That is correct.

Q. Mr. Larson, as an engineer expert, you keep familiar with the construction projects you stated and read the Western Construction News and other publications? A. I endeavored to.

Q. Did you read this article that appeared in the Western Construction News and Highway Builder of July, 1933, reading from page 318:

> "Both tunnel sections will be 35 feet out to out in excavation and 34 feet high. A reinforced concrete lining will be placed throughout, varying from 2 feet thick at the crown of the arch to 5 feet at the haunch. The tunnel is expected to require support for practically the entire length of each bore and the contractor will be allowed to place either timber sets and lagging or steel ribs and liner plates back of the concrete. Where practicable, the upper part of the arch is to be poured last so as to key the tunnel structure. Concrete specifications are based upon cement content and slump.
>
> "Tunnel muck is classified as Monterey sandstone for the first 600-700 feet from the west portal, Claremont cherts for 1200 feet, and

(Testimony of Lewis Michael Larson.)

Orindan formation for the remaining distance. A geological report on the tunnel has been prepared by George D. Louderback, consulting geologist, and will be available for inspection at the office of the District Engineer."

Did you see that article?

A. Not until within the last two weeks.

Q. So that at the time you did not have it in mind?

A. I did not have it in mind. If I had had it in mind I would wonder why Dr. Louderback had apparently disregarded that, if he thought it [881] worthy of giving consideration to, because the conclusion here must be very different from what you have just read.

Q. Of course, this article was published with respect to the geological report that you have there.

A. I could not know the source of the information.

Mr. Tinning: We will offer this article in evidence.

Mr. Marrin: For what purpose?

Mr. Tinning: For the purpose of expert knowledge or lack of knowledge.

Mr. Marrin: We object to that as immaterial, irrelevant, and incompetent. The witness has testified that he did not know anything about it prior to the time the bid was placed; we object to it further as being pure hearsay.

(Testimony of Lewis Michael Larson.)

Mr. Wittschen: Will you stipulate that the Bechtal Company was a subscriber to the Western Construction News?

Mr. Marrin: I could not, because I don't know whether they were, or not.

Mr. Wittschen: We will prove tha .

Mr. Marrin: It is a hearsay statement.

Mr. Alexander: The same objection.

Mr. Marrin: It does not show the sou ce of the information, it is the rankest kind of hearsay; We object to its introduction.

The Court: The Court will sustain an objection at this time.

Mr. Tinning: Exception.

Q. You testified here last week with respect to the method that you adopted in going underground in this tunnel, that the method shown on the model which has been introduced here as Plaintiff's Exhibit No. 28 was what you purposed using in getting under what you assumed at that time would be 40 feet at the west portal.

A. With certain exceptions, Mr. Tinning. I had not planned to [882] make the lower drift as large. I had planned on making the other drifts larger. This exhibit here is the result of a condition that was found that forced me to adopt this particular design.

Q. Then perhaps I did not understand your testimony. Then Plaintiff's Exhibit No. 28 represents the manner in which you actually drove?

(Testimony of Lewis Michael Larson.)

A. The manner in which I actually drove, and approximated the manner that I contemplated driving.

Q. And Plaintiff's Exhibit 27, Section AA, is a diagram of what you proposed?

A. What I proposed.

Q. Now, I believe you stated that when you got into this problem, actually working it out, you found it necessary to go into a 13 drift operation?

A. That is true.

Q. Does this model show a 13-drift operation?

A. It is lacking in the fact that the posts have been removed, that bring out clearly the drifts, but the segments, if you will count the segments they will show you that there are 13 drifts present.

The Court: Indicate that so that I may follow you.

A. These, your Honor, are posts and segments, and when I refer to the number that would make up 13 drifts, and some of the information is wanting in driving a drift, we have posts at the contact of the segment timbers carrying down to the core. Those have not been introduced in this particular model.

Q. I understand, but how do you make up your 13?

A. Here would be 1, 2, 3, 4, 5, and 6; the top drift would be 7, and then there are six on the other side, making a total of 13.

(Testimony of Lewis Michael Larson.)

Mr. Tinning: Q. Mr. Larson, just a moment, please, while you are on your feet. A drift is indicated on this model by perpendicular posts and a cap?

A. Correct.

Q. And is it not a fact that in driving this tunnel you went up with four drifts on each side, as indicated in the model, to [883] the point that I am pointing to at about the point opposite where the core is shown on this model?

A. I went up with four drifts to this point, yes.

Q. Each one of these drifts has a cap upon it, as shown here, posts on the outside, and posts in the interior with lagging against the core; that is correct, is it not?

A. If the testimony is to be technical I shall have to say that after you reach the spring line then we term them segments instead of posts.

Q. But to answer the question specifically, you have in a drift an enclosure on three sides, the top and the two sides that are either perpendicular or angular to meet the design of the tunnel outline up to and including the fourth drift? A. Yes.

Q. Isn't it a fact that in your excavation of both the south and north tunnels the distance of your first operation, that you took out a ring between the top of the fourth drift, all in one operation?

A. That is not a fact.

Q. Isn't it a fact that each segment was placed and held a timber stulled against the core, and that

(Testimony of Lewis Michael Larson.)

this material was not taken out by driving ahead under one segment, but was taken out as a complete operation at the face of the tunnel on the top of the core?

A. Generally, that is not the fact. Generally, these drifts were advanced as individual drifts. There might have been a very few exceptions where the material was stiff enough that I could carry possibly three of these drifts parallel, but that is the exception, and not the rule.

Q. Isn't it a fact that these timbers were carried up, that segment timbers were carried up by excavation into the face and held up and stulled against the top of the timber, which was a cap of the fourth drift, and then the next segment toward the center, or next to the crown, were carried up and stulled likewise against the cap?

A. I think this one, here, was carried to the core. That [884] is my recollection.

Q. Will you look at the model near the part that indicates the unexcavated ground and see if those timbers which show on the last ring at the top do not indicate the way in which that was supported?

A. It indicates the support at this point, which is a segment, which is carried down to this cap.

Q. What is this section?

A. In this particular case it would be E section.

Q. The E segment? A. The E segment.

Q. What was the distance between the bottom of the E segment and the top of the cap of the fourth drift?

(Testimony of Lewis Michael Larson.)

A. I cannot recall it now, I should say probably four feet.

Q. And would you say that that was drifted out and was not taken out by the surface by one operation across the face?

A. I am very sure in the major portion of the tunnel that that was not the case; there might have been exceptions to that.

Q. We are just talking about going underground in the 110 feet of the north tunnel and 92 feet in the other tunnel.

A. Yes, I am trying to make the explanation here that to the best of my recollection that was not the case in general.

Q. You do not think that that crown was stoped out?

A. It was stoped out after you reached the lower drift, the material then was dropped into the drift below.

Q. Isn't it a fact that it was taken out as one operation and that the only timbers you had, you had no lagging in this crown, were timbers holding up your sides as you put them in?

A. No, that could not be true. If I understand you correctly in this case—do you mean that I was dumping the material over the face of the core?

Q. No, I assume you would be dumping the material as it was stoped [885] out from the entire ring above four feet into the third drift.

(Testimony of Lewis Michael Larson.)

A. Yes, that is what I was doing, and carrying it up to the lower drift, getting the support from this segment down to the core.

Q. But there was no lagging, there was no partition, there were no caps, and there were no interior walls in the drift, as you have shown, in drifts 1, 2, 3, and 4? A. Not in this one here?

Q. Yes.

A. It is my best recollection that this post that carried down to the cap of No. 4 had lagging against to prevent this material from falling in.

Q. Are you depending on your recollection?

A. I am depending on my recollection.

Q. I will show you Plaintiff's Exhibit No. 40, which appears to be a photograph of the west portal face from the right side of the center line, August 10, 1934—I am not trying to confuse you, but I understood your testimony to be that these two drifts later became part of the Drift No. 1, one in the left tunnel and one in the right tunnel.

A. No, that is a misstatement, Mr. Tinning. They were driven in at that time with a view to trying to carry on the excavation by this to the right and this to the left of the attempted drift.

Q. In other words, these two drifts that are here shown were actually on the center line of the tunnel?

A. As nearly as we could make them.

Q. And when you went underground, in starting, I think you said, about August 23rd? A. Yes.

(Testimony of Lewis Michael Larson.)

Q. You placed one drift that would be the right-hand drift to the right of this attempted drift?

A. Yes.

Q. And another one to the left? A. Yes.

Q. And when you started on the north tunnel you likewise show the drift in here and a drift—when I say "here," to the right? A. Yes. [886]

Q. Of the original parallel drift and again another one to the left?

A. Yes; to make it clear to you, I first made an attempt to go in that way on account of other work that was going on in advancing that interior, and my recollection is, and I believe it is true, that by the time that I got to going in on the first one, that that was obliterated entirely, that that was no longer there.

Q. That is your general impression of the situation?

A. It is my general impression, and I think it is pretty clear on that.

Q. Now, these drifts numbered 1 right and left, the bottom drift on each side, when you went underground were twelve feet wide each, weren't they?

A. Approximately.

Q. And then you gradually narrowed those down as you went underground and when you were 10 or 20 feet underground you cut them down to 10-foot drifts?

A. I do not believe, Mr. Tinning, that there was any difference in the width of those drifts during

(Testimony of Lewis Michael Larson.)

the whole course of the 92 feet and 110 feet. I have no recollection of crimping it. My reason for making them as wide as they were—let me explain that, it will make it clear—we had four-yard cars, that would hold four yards of material, and on them we put sides to increase the capacity, and that was a definite width; we could not vary to the point where we could not get those cars into the drift; the drift, to begin with, as I recall, was sufficiently wide and no wider than was necessary to allow free movement of the cars. It might be—my recollection is not clear on that—that when I found I could go in there a few yards, I might have taken advantage of it on account of the terrific weight of the ground.

Q. Isn't it a fact that your drifts started in 12 feet and were cut down to 10 feet, and the reason was you had to cut a core in, you had to switch something to key to that line, and you had [887] to have a little extra room to get around the curve into the drift?

A. You are refreshing my memory on that. I remember what the obstruction was now and I will explain it. Right in here was an obstruction——

Q. By "here" you are referring to the north tunnel?

A. On the north tunnel, and in order to get past that obstruction I did have to slice off a little more of the core. I had forgotten that.

Q. Mr. Larson, I am going to show you a series of diagrams which I think depict the actual position

(Testimony of Lewis Michael Larson.)

and the measurement of every timber that went into each of these tunnels in your initial operation.

Mr. Smith: What have you got there, diagrams of the whole 110 feet?

Mr. Tinning: This happens to be the upgrade tunnel, the south tunnel, so it is 92 feet.

Q. I show you some diagrams showing the south tunnel of the west portal.

A. Let me ask you this question, is this the first set that carried no weight?

Q. That is the first set, and I think it would be indicated, I think you will find the portion I am pointing to here.

A. There was a particular reason for my asking that. Apparently the cap on this, this cap, here, is standing entirely on a scab that is held by nails. I would be inclined to challenge that part without having any way of definitely proving I am right, but I am very sure that the weight of the material would forbid the use of that.

Q. Mr. Larson, if you will look at the model you will see you have got a scab on your model.

A. Yes, the scab I think carries down to the footblock there, but you will notice on this one you [888] are not carrying it to the footblock; you are depending entirely on nails that project up above this cap, and carries the weight of the whole cap, and nothing but nails, which makes me question it.

Q. That makes you question it? A. Yes.

(Testimony of Lewis Michael Larson.)

Q. These are measurements that were taken there and of course I was not there, but we will note this exception.

A. Yes, I think there is a mistake there.

Mr. Smith: Which one are you referring to?

Mr. Tinning: We will have to take these by numbers. These diagrams were made at the time from measurements that Mr. Ray, a District employee, took from day to day. You feel that the diagram appearing on page 1, which shows it is in a scab nailed onto a 12 by 12, on that north side of the original center drift is in error because it shows that it must have been nailed against another piece of timber and would not sustain the weight?

A. There is another omission. There is nothing across the top here that we term a scab to prevent that cap from falling off from this support, here, and falling into the tunnel. So I think something has been overlooked.

Q. At that point there was no material on top of this, it was simply a platform to hold the lagging for what afterwards became another drift?

A. Or more accurately stated probably an incompleted set.

Q. What do you mean by incompleted set?

A. The work on the set had not been completed to the stage where the set, itself, was complete.

Q. That is your judgment?

A. That is my judgment, it is so obvious.

Mr. Smith: Does that bear a date?

(Testimony of Lewis Michael Larson.)

Mr. Tinning: Yes, September 16, 1934. [889]

Q. I will now show you page 2, bearing date the 23rd of September, 1934. You will notice that on each of these diagrams there is a statement of the station and the date that the set was placed, and I understand that the measurements were taken immediately following.

A. I see another error here. I am not afraid to challenge this one. These posts against the core in the second drift were of a length whereby the cap rested on the post, not on a scab on this set, but was resting on a scab on this set. And another thing is this, here, may be a support for a shore that ran to the building, but if it is not, then there is an error there, because this post was divided at this line, here—pardon my writing on that.

Q. I think it would be better not to write on it, because they are original records. What you describe is this post, here, above the 12 by 12 plate on the left-hand side of the picture?

A. I do not think his Honor can see this. The point I am making is this, this post was an independent post sawed off at the top of this cap.

Q. Let me get that for the record. This post is a vertical post running from the top of the first drift on the interior right against the core vertically, as shown on here, through drift No. 2 and drift No. 3 to the bottom of the cap of drift No. 3. You say that should be two posts and that the cap of drift No. 1 should extend through? A. Let me illustrate.

(Testimony of Lewis Michael Larson.)

Q. Will you answer my question? A. Yes.

Q. On the other side of the drifts, of these two upper drifts, 2 and 3, instead of being shown as one continuous post, running over to the wall plate on the left drift, to the wall plate at the top of No. 3 drift, that that should also be two posts?

A. And a wall plate in between. [890]

Q. The wall plate in between?

A. Yes, and this member here——

Q. That is the cap of drift No. 2?

A. Yes, was heavier than 3 by 8, and I am confident this shows two 3 by 8s, if that is intended for the post, and I doubt that Mr. Ray had that in mind. I am inclined to think he picked up the support for the stull that runs to the portal building, and I would suggest that you bring that to his attention, because I think he has—that this cap carried over this post and this post set on that cap, and this cap rested on this scab, but in this post here was another wall plate, and that was uniform in the drift on each side.

Q. Those are your suggestions with respect to Sheet 2? A. Yes.

Q. I will hand you now sheet 3, showing a section at 111 plus 72; that would be 5 feet farther into the tunnel than the section shown on sheet 2.

A. This is typical of what I was trying to show over here.

Q. The witness is now pointing to the right-hand drift on sheet No. 3 and stating that the drawing

(Testimony of Lewis Michael Larson.)

there typifies what he says should appear on the left-hand side of sheet No. 2. You will note that Sheet No. 3 shows the left-hand drift in the same manner as you stated was in error. A. Yes.

Q. The same thing applies to it? A. Yes.

Q. And you still think that is an error?

A. I am very confident that is an error.

Q. Now, we go in another four feet on sheet No. 4.

A. Now we are in 8 feet from the first set, as I understand it. The first one is outside.

Q. The first is 111 plus 62 and this is 111 plus 76, that is 14 feet? A. Yes.

Q. And there have been sets intervening from the first set? [891] A. Yes.

Q. This is the fourth set? A. Yes.

Q. 60 feet in? A. Yes. This is typical.

Q. So you have no objection to the general typification of the method which he used?

A. There is only one thing lacking that I should call attention to at this point, the same problem here, there was nothing to keep this post from kicking in from the weight of the core in each instance; a section should be shown in there to hold the other.

Q. When you say "this post" you are referring to the vertical post against the core on the drift on both sides of the tunnel? A. Yes.

Q. Does your model show any scab?

A. I imagine it does, I have not checked it over.

(Testimony of Lewis Michael Larson.)

Q. The next one is approximately four feet further in to the mountain and it shows the post set in the fourth drift on the north or left-hand side of the upgrade tunnel; there seems to be no change in the type of construction on the other side.

A. In carrying up your sets we have not got into the drift on the right-hand side. I want to make the same remarks that the scab has been left off in each instance to keep the post from kicking in.

The Court: On both sides? A. Yes.

Mr. Tinning: Q. In every instance, nowhere in these drawings so far does it show that there is any scab or something similar to a collar brace in the opposite direction between the outside of the permanent timbers and the interior timbers, vertical timbers that are against the core?

A. There are other things lacking that are not intended to be carried in here—you have no collar braces.

Q. You cannot show collar braces very well on a vertical? [892]

A. Yes, it could be shown, but it is not material unless attention is called to the fact that they were.

Q. There is nothing shown that does not pass through the section, and of course the collar braces do not pass through?

A. No, the collar braces would rest on top and underneath the wall plate and run from post to post.

Q. Longitudinal braces? A. Yes.

(Testimony of Lewis Michael Larson.)

Q. Now, we come to another four feet, and we find the same situation, with your four drifts on each side, subject to the same exception that you have taken to the photograph of scabs. Now, on page 8 we have another four feet, five feet this time, from 87 to 92, and you will notice we have spiling on top of your fourth drift and you have vertical timbers running from the core to the end of the segments shown very much as they are shown in the model? A. Yes.

Q. You have testified that each of these was run, each of the places in the crown above the fourth drift was run as a separate set, and taking them together, one, two, three, four, and five drifts, that is how you get your thirteen drifts you said you had?

A. I believe in substance that is correct.

Q. But it is true, is it not, that there was no spiling or lagging on these timbers, that supported the ring section and that those were 4 by 12 timbers that were placed under the end of the segments as they were placed in, with the exception of the cap, which was dropped into place against two 3 by 12 longitudinal timbers?

A. Wall plates—you are not attempting here to show any of the outside supports other than the segments?

Q. The sets, themselves.

A. That would be true in part of the tunnel, but I do not believe it is typical of the whole of the excavation. [893]

(Testimony of Lewis Michael Larson.)

Mr. Wittschen: What we are leading up to,—so there won't be any confusion—the purpose of leading up to this was to show these were not true wall plate drifts.

Mr. Tinning: Q. Looking at 58, you say that is illustrative of the conditions, but you don't believe it is typical of——

A. You get the 4 feet—4 feet apart. These were 4 feet apart.

Q. Sheet No. 9, you see the same condition. Sheet No. 10, you see the same condition depicted; again, Sheet 11, the same condition depicted. Coming to Sheet 12, the same condition depicted. Coming to Sheet 13, 112 plus 12, you see the same condition depicted. At 112 plus 16, on Sheet 14, you see the same condition. At Sheet 15, on the next set, the same condition. Sheet 16, the same condition depicted. Sheet 17, the same condition depicted. Sheet 18, the same condition depicted. Sheet 19, the same condition depicted. Sheet 20, the same condition; and at Station 112 plus 44, the same condition, again. That is the end of your 92-foot excavation, with this drift method; that is 21.

We will offer the diagrams that have been shown to Mr. Larson, as Defendant's Exhibit "J," consisting of 21 original sheets; and, gentlemen, if we would like the privilege of substituting copies at some time in the proceeding, we will be glad to leave these here, but we would not want them to remain.

(Testimony of Lewis Michael Larson.)

Mr. Marrin: Yes; no objection to that. Of course, as these have not been identified by the man who made them, I suppose the witness who made them will be available?

Mr. Tinning: He is available at any time you desire him.

Mr. Smith: Was that only one exhibit?

Mr. Tinning: One exhibit.

Mr. Smith: What is the number?

Mr. Tinning: Exhibit "J." [894]

Mr. Smith: Can we withdraw them overnight, if we desire to do so?

The Court: You may take it up with counsel; I don't think you will have any difficulty.

(The sheets were marked "Defendant's Exhibit J.")

Mr. Tinning: Q. Now, on the downgrade tunnel, I show you some sheets, Mr. Larson—and, by "downgrade tunnel," we refer to the north tunnel?

A. Yes, I understand.

Q. The situation is similar with respect to the diagrams: Diagram No. 1 shows the first set of timbers. It seems to be subject to somewhat the same exceptions. You will notice the cap runs completely through?

A. Yes; and the one thing omitted is the scab that keeps it from——

Q. If you will look at your own model down here, you will see that, in some places, you have scabs; and in other places, you do not?

estimony of Lewis Michael Larson.)

A. Yes, that is true. I overlooked that important n, myself.

Mr. Marrin: I might say we did not introduce model as portraying any particular timber that s put in.

Mr. Tinning: I understand.

Mr. Wittschen: It was supposed to have all that have in there, though; it was demonstrative of the timbers used, but not in any one place.

Mr. Tinning: I don't think whether there was a b or anything else in any particular place is anyng except for Mr. Larson's own satisfaction with pect to the accuracy of these diagrams. These grams are offered for the purpose of showing t there were not 13 drifts; that there were 9 fts, going underground.

The Court: The details won't make very much ference, for the purpose of the offer. It only has do with what actually was there. [895]

Mr. Tinning: That is right; that is the purpose these diagrams.

Now, I don't know whether it is necessary to go rough these in detail; it may satisfy you more as their accuracy; but, turning over until we come a 4-drift operation, you will notice at no place is ere any spiling or lagging showing against the e; it is the set,—the timber structure,—that gives the integrity and strength of your timber supt. We go over to Sheet 6, and we find the same uation that was depicted on the other diagram, by

(Testimony of Lewis Michael Larson.)

you; and the core is not even sketched in. Here is your ring segment above the fourth drift, on each side being supported by 4 by 12 timbers, 4 feet 8 inches long, and running around the entire circle of the arch, above the fourth drift. Would you say that substantially shows the condition, as it existed in the tunnel at that point,—Station 111 plus 72?

A. I think there are exceptions to that, that I should note here: In the first place, I don't think there was a uniform use of the size of timbers. My recollection is that that would vary all the way from 8 by 8's, possibly 6 by 6's, and 10 by 10's. The point I am bringing out: this is not a real true illustration, because I have learned, in the last few days, that I had to be very careful.

Q. Let's take Sheet 6, on the north tunnel, where you will see a 6 by 6, two timbers away from the one you pointed out?

A. Yes; but this is not a 6 by 6 here.

Q. Well, I am showing you one, two sticks away from the one you pointed out,—the same kind you called a 6 by 6?

A. Yes; but I still believe there were 6 by 6's, 8 by 8's, and 10 by 10's, at this point.

Q. That may be true. You find, on your next diagram, that you have here, 6 by 6's forming the stulls from the cap on the fourth drift, on each side of the tunnel. You find that again, 6 by 12. [896] You have that, also,—heavier timber, on Sheet 8, being shown there; and on Sheet 9, 6 by 12; 6 by 12 in the same

estimony of Lewis Michael Larson.)

ition; and we come over to Sheet 10, and you find same thing; and on Sheet 11, the same thing. ur center is held by 4 by 12's; and the top of the of the fourth drift, 6 by 12. Doesn't that demonate to you, Mr. Larson, that those sections above fourth drift were not, for instance, stoped out an operation such as I described to you in the er bunch?

A. It does not. I believe we can upset the statent on that, by overwhelming evidence.

Mr. Tinning: We will offer the diagrams in dence.

(The 12 sheets were marked "Defendant's Exbit K.")

The Court: We will take a recess.

(Recess)

Mr. Tinning: Q. Mr. Larson, looking at Plain-'s Exhibit No. 29, I would like to ask you if it not true that, in proper, careful timbering, the gs and timbers should be set, as they are shown this model, so that the timbered section as a unit vertical? A. Vertical; this way.

Q. Yes. It sets in a vertical plane?

A. That was the determination of the District gineer when the question came up whether it ould be a right angle to the grade of the tunnel whether it should be vertical; and the determinan was that it should be vertical.

(Testimony of Lewis Michael Larson.)

Q. Vertical. Well, at any rate, a timber structure, such as a ring, as shown on this model, to have its maximum strength, should be placed in a vertical position, should it not, so the weight is transmitted through it?

A. That it has strongest resistance in a vertical position, I believe, is generally accepted.

Q. And the joint between the so-called plumb posts and the segment should be so cut that, when the timber is installed, you get a full [897] bearing between the two pieces of timber and that joint?

A. The best authority for that,—the Railroad Companies—the first people to go into the tunnel business to any great extent, found it good practice to have the back of the segment open, this way, so that the weight, when the weight came, it would close. If you make it tight, as my hands are, when your weight comes and it spreads like this, then this part of the segment will split off.

Q. When the timber takes the weight for which it is designed, then the joint comes together?

A. That is the theory.

Q. And to obtain the maximum strength, the joint should have full bearing?

A. That is the theory: it should have, yes, if that is possible.

Q. And the timbers which are placed so that they would not follow through a vertical plane, for instance, say, the top of this section which I have my hand upon, this ring were half an inch toward

(Testimony of Lewis Michael Larson.)

me, so that the top, or crown piece, was not in the same vertical plane as the plumb post, would not be a timber, or timbers, that had the same strength as ones which were properly placed?

A. That is obvious.

Q. During the time you were constructing the tunnels, Mr. Larson, you stated already that Dr. Louderback was frequently in the tunnel. Did you see him, during the time you were employed by the Six Companies, after August 29, 1935?

A. After August 29, 1935?

Q. That was when you came back——

A. Yes; I am trying to recall. I think I saw him either August 29th or August 30th; I am not sure as to the exact date, but it was about the 29th.

Q. Where did you see him?

A. I saw him up at the Old Tunnel Road.

Q. Did you have any conversation with him at that time? A. I did.

Q. Did you tell him, at that time, that you thought the conditions encountered were different from those you expected, or that you [898] anticipated, from his report?

A. I have no recollection of having discussed that phase of it at all.

Q. Did you tell him that you thought that the published attack made by Six Companies on his geological report was unfair and unfounded, and that you thought the conditions that you had en-

(Testimony of Lewis Michael Larson.)

countered in the tunnel were fairly predicted by his report?

A. I have absolutely no recollection of that; and I believe that is not a fact.

Q. When you were working in the tunnels, and prior to the time that you left on April 30th, in any of the conferences that you had with Dr. Louderback at the tunnel, did you tell him that the estimate that you had made for Six Companies had been cut down by Mr. S. D. Bechtel from $180,000 to $200,000—an amount somewhere in that neighborhood—between 180,000 and 200,000—because Mr. Bechtel said he had a sentimental reason for wanting to put in a bid that would get the job?

A. I have no recollection of having talked to Dr. Louderback on the estimate in any particular.

Q. Did you make that remark to anyone, at any time?

A. That remark was brought up to me by someone, and I don't know how far the remark was carried. I do believe that I admitted that Mr. Bechtel had said that his father had wished to drive the tunnel, and that there was a sentimental feeling regarding that particular job.

Q. How much was your estimate cut down, by Mr. Bechtel's bid?

A. I believe, later investigation shows only a very, very minor amount. That is what I think the attorneys wished to introduce over your objection.

(Testimony of Lewis Michael Larson.)

Q. How much was it cut down, in your opinion, at the time that the bid was submitted?

A. I am not prepared to say that I knew, at the time that the bid was submitted, that the estimate itself had [899] been cut at all.

Q. You knew it before you left the Company on April 30th, didn't you?

A. Only, I heard these rumors from different sources; and I am not prepared now to say definitely who carried me that information; but there is no evidence, now, nor was there any evidence at that time, that my bid price had been substantially reduced,—that is, nothing tangible.

Q. Did you ever say it to anyone?

A. Not that I recall directly. I know the question was brought up to me, and I discussed it.

Q. Did you ever say it indirectly?

A. Not that I have any knowledge of; not that I have any recollection, at the present time.

Q. Now, you testified, at length, last week, concerning your difficulties in placing concrete in the west portal excavation,—92 feet on one side; and the other, 110 feet. You knew, at the time that you made this bid, or this estimate, that, under the specifications, unless you could place concrete continuously, it was to be placed—where the operation was not continuous, it would have to be placed in one-foot layers; you knew that?

A. I believe—Let me qualify that. I am not sure that I do know that. I believe the specifications say

(Testimony of Lewis Michael Larson.)

that it can be placed in six-foot layers. I might be in error on that. I am not making that as a definite statement; but we will let it stand that it was one foot, for your purpose.

Q. One-foot layers. You stated that the Hackley Gun was selected by you because you knew it was the only approved method at the time; although you knew of the Pumpcrete, you did not feel it had been a tested method by which you cared to try to operate in placing the concrete in this tunnel?

A. I wish to qualify that. I won't say the "only approved method"; but the best and most approved. [900]

Q. Most approved. What were some of the other methods that might have been used?

A. By hand would be one. I don't know whether there would be but the two, right now; I cannot recall except Pneumatic and Hand Placing.

Q. Well, there are other Pneumatic methods, aren't there? A. Yes.

Q. That have been used for 25 years, besides the Pneumatic Gun?

A. Yes; they are numerous; but the principal is identical.

Q. And, of the Pneumatic methods, you have in mind the Hackley Gun was the best?

A. Well, I wouldn't say it was the best; but I was familiar with it. I had placed many thousands of yards with the Hackley Gun.

(Testimony of Lewis Michael Larson.)

Q. Did you ever have a wooden baffle box at any other place when you used the Hackley Gun, other than this Broadway Tunnel?

A. Not that I have any recollection of. There was never a call for it.

Q. You used a steel baffle box in other places, didn't you?

A. I can't recall that I did; I don't believe I did.

Q. Do you know how it was placed in the Sunset Tunnel, where the Hackley Gun was used?

A. No.

Q. You do not know, then, there was a steel baffle box used there, which was of a size that would go between two circles of reinforcing steel,—one on the interior of the arch, and the other at the exterior?

A. I do not. I merely know that Mr. Hackley, who had placed the concrete in the Sunset Tunnel, was chiefly responsible for the suggestion of the method of placing it, and the baffle box idea that we tried out in the Broadway Tunnel.

Q. That baffle box gave you lots of trouble, didn't it? A. A tremendous lot.

Q. It was shattered by the force of the violent inflow of the concrete as it was shot up into the arch? A. Yes. [901]

Q. Into the forms? A. And plugged.

Q. In other words, the material segregated, did it not, and the finest separated out and plugged, and

(Testimony of Lewis Michael Larson.)

the rock went on down; isn't that what you found when you had to clear the plugged lines?

A. Not to the extent that you have described it, Mr. Tinning. I cannot recall, right now, that I found any segregation, on account of the fact that it developed, at the time that I uncovered the plugged line; but I do know, upon placing Pneumatic concrete, there is a tendency for the heavier particles to travel more rapidly than the lighter particles, with a logical result that a certain amount of segregation occurs, in the use of Pneumatic Guns.

Q. That does not give you as good concrete as where you could place a uniform mixture?

A. I think that the Pumpcrete,—if that is what you are driving at,—is much better.

Q. I am not driving at anything, Mr. Larson. I am asking you a question.

A. The uniform mixture is a desirable thing; but I will say this: that we accomplished that very uniformity of mixture in the Claremont Tunnel by shooting the fresh concrete into the concrete then placed; we had a uniform slope there, and shot our first concrete into the old concrete, and it was beautiful concrete as it flowed down the side.

Q. You could not use that method in this tunnel, in the specifications, because you had to place concrete in vertical layers?

A. That was the handicap.

(Testimony of Lewis Michael Larson.)

Q. The reason for that was to make a radial joint, was it not, for the arch?

A. Well, the original specification was: the walls were to be poured up to a certain point, not closer than 2 feet, if I remember that correctly, where they must be keyed; and then, I believe, 7 days later, the arch,—the keyed position,—was to be poured. [902]

Q. Providing it was not poured as a continuous process?

A. Well, this provision was an agreement, between Mr. Boggs and myself, in advance of the estimate, that he would voice no objection to it as——

Q. Well, there was nothing in the specifications to prevent it, was there?

A. I don't know, positively. There may be a positive statement in the specifications on that. My memory is not clear. [903]

Q. In going underground and placing your concrete in these two ring sections, you made in your testimony considerable objection or voiced considerable problems arising from the fact that you had to place your concrete between two sets of reinforcing steel inside of the frames. You said that that caused you additional difficulties?

A. It surely did.

Q. You understood and were told before that the engineer had certain flexibility possible under

(Testimony of Lewis Michael Larson.)

his plans and that he could put additional steel into the sections when in his judgment it was required?

A. That was my belief and understanding.

Q. And that is what was done, too, in the tunnel?

A. That is what was done.

Q. And you had considerable pressures in these rings, did you not, at the mouth?

A. How is that?

Q. You had considerable pressures, you have told us how the stulls bedded into the core and how you had great difficulty holding timbers?

A. Yes.

Q. And how you ran stulls out to the concrete walls at the bottom of the set to hold those timbers in shape so that you could pour and not lose the whole thing?

A. That spiling, let me qualify that, was during the excavation period and stulls to the core was during the excavation and concrete period both.

Q. You had trouble holding the ground, there was extreme pressure in that loose material, that creep and hill wash?

A. Whatever the material was there was a considerable pressure.

Q. So that the District Engineer, in ordering additional steel and additional reinforcing, as he had a right to do under the specifications, was meeting a condition that actually existed?

A. He was, and we did not quarrel about it.

(Testimony of Lewis Michael Larson.)

Q. You found that your baffle box caused slowness in your operation? [904]

A. I did, Mr. Tinning, but the point I would like to bring out in this particular case, at the time we installed the concrete placing unit, I drew a logical conclusion, I think logical, that we could pour one wall at a time; you had two walls that were separated there by probably 25 feet, and I think I remarked at the time that by pouring one wall here and one wall there, if you object to pouring into walls one at a time, why shouldn't you object to pouring in two walls of the portal building at the same time? In this particular place I could not get the point over; I was prepared to pour the one wall at a time and avoid a good deal of this trouble, but that was objected to.

Q. You were not permitted to do it in the south bore?

A. In the south bore, no, but permitted to do it in the north bore.

Q. You had two Hackley guns at the north bore, didn't you?

A. Not mountable, as I recall. I may be mistaken in that.

Q. Isn't it a fact that when you poured the north bore you had two Hackley guns on the job, and you poured one wall from one Hackley gun and the other wall from the other?

A. You may be right. I won't quarrel with you on that.

(Testimony of Lewis Michael Larson.)

Q. You also had difficulty getting concrete mix into your Hackley gun as fast as you could place it with your Hackley gun at times?

A. I believe you are right, though I am not sure of that. I have forgotten the detail.

Q. It was about the first of October that you started to pour this concrete?

A. Approximately.

Q. Well, roughly, the first of October?

A. It was in October, yes.

Q. What concrete plant did the Six Companies have on the job at the time you started to pour these rings?

A. A rented one of K. E. Parker Company. [905]

Q. The mixer that you used was the same mixer that K. E. Parker used in constructing the building, was it not? A. Yes.

Q. That was the same mixer, a ¾ yard mixer?

A. I have forgotten the capacity. We will let it stand at ¾ of a yard.

Q. You found as you were using that mixer that there was difficulty and delay in getting enough material to keep your Hackley gun going?

A. Probably in the north tunnel, but I think we had ample time in the south tunnel.

Q. That is your recollection?

A. That is my recollection.

Q. Then why did you rent or take over the use of the Bohnet mixer, a ½ yard mixer, while you

(Testimony of Lewis Michael Larson.)

were pouring the south tunnel, adding capacity to the one you were renting to Parker?

A. I do not remember having done that, but if we did do it, undoubtedly it was the fact that that would not be able to supply it as fast as we could place it, but we apparently had ample time, because, if my memory is correct, we had an hour and a half between pouring one side and then pouring the other side.

Q. It is true, is it not, that you had a number of trials of different methods of getting the pipe up from the Hackley gun to the baffle box in the forms?

A. I do not recall any trouble of getting the pipe up, but I do remember the problem of making the baffle box work; if we had a problem in getting the pipe up I have forgotten it.

Q. Do you remember that there was brought out there, and you have already testified that you could have any equipment that you wanted, whatever you asked for, there was brought out there a large rubber pressure pipe that you hooked up after you had your trouble with some other pipe, and when you ran the Hackley gun into it it blew up from end to end?

A. No, I do not.

Q. You do not remember that?

A. I do not remember that. [906] I remember we had a long piece of pipe that we used in the forward end with a view to pulling it back.

(Testimony of Lewis Michael Larson.)

Q. Was that a rubber pipe?

A. That might have been the one to which you refer. I don't remember its set-up. It might have been down.

Q. Do you remember a rubber pipe?

A. A rubber hose?

Q. Yes. A. Yes, I remember it.

Q. Don't you remember that it failed on the job, it blew to pieces? A. Yes, I know that.

Q. That delayed you some, didn't it?

A. That delayed some, but it was minor compared to other problems; it added to the delay.

Q. It added to the delay? A. Yes.

Q. Then this baffle box that you had up there, when it would go to pieces, I don't know how far it went to pieces, you know more about that than I, but at least it would not function, and it was shattered by the explosions or expulsion of this material with explosive force so that you would have to have a man up there or men up in there to repair it frequently?

A. I am afraid too frequently.

Q. It was quite a frequent thing?

A. It was quite a frequent occurrence.

Q. You had a great deal of trouble with it?

A. Yes.

Q. When you went over to the north tunnel you did not use that baffle box?

A. No, the District Engineer was willing there to give us cooperation and it helped very materially

(Testimony of Lewis Michael Larson.)

by letting us pour the walls at a height of about 15 feet and pouring one wall and then pouring another, a very material help.

Q. You had two Hackley guns to do it?

A. Possibly.

Q. There was another one on the job before you started to pour? A. That is possible.

Q. During this time when you were having this trouble with the [907] baffle box you mentioned the insistence of the District Representative that you get into these forms and clean off the concrete that stuck to the reinforcing and stuck to the sides of the forms. A. Yes, and on the arch section.

Q. That was necessary, was it not, to get the proper forms for your concrete? You had an inch or two of what was like spattered plaster?

A. I think it was proper and there was no argument at all. It was just one of the delays.

Q. It was one of the delays? A. Yes.

Q. It was one of the delays that resulted from the method which was adopted there to do that concreting?

A. One of the delays that resulted from having to pour first one wall and then the other instead of pouring one wall at a time.

Q. One of the delays that resulted from your having to comply with the specifications in pouring concrete?

A. I would not like to say to comply with the specifications, because I don't know of anything in

(Testimony of Lewis Michael Larson.)

the specifications that precluded the pouring of one wall first and then the other wall.

Q. Although it was required by the District Engineer, and it was required that it be poured in layers not exceeding one foot if it was not a continuous pouring operation?

A. Yes, and between periods that it must be vibrated, in order to be compact, which I am not quarreling with, because it was a proper provision.

Q. It was a proper provision, and it was required for all of the concrete placed in the concrete lining? A. It was.

Q. And it resulted in a homogeneous, uniform concrete which was free from voids, as far as possible, in practical working operation?

A. That was the intent, and I believe that was accomplished, or very nearly so.

Q. Would you say that the concrete which you placed in these two sections of the southwest portals of the tunnel was placed without [908] voids?

A. I believe later developments showed that in the arch there were voids.

Q. It was necessary afterward to cut out considerable portions of that concrete, was it not?

A. So I have been advised.

Q. Wasn't that while you were there?

A. No, I was not there at the time. I poured the concrete, but the repair of it was done after I left.

Q. Didn't you see the concrete after it was placed and the forms taken out?

(Testimony of Lewis Michael Larson.)

A. Yes, I did.

Q. You saw that there were large parts of that concrete that were placed in these tunnels by the Hackley gun which had porous spots and pits in it?

A. I would not say that, because I believe that is an exaggeration of a condition. This bad concrete or these pits that you speak about I believe were not visible, and were detected later on by drilling in from the top, that is my understanding, but I think the finish against the concrete form did not show any amount of defective concrete. There were vertical cracks, but that was not the result of pockets.

Q. Part of this tunnel lining was poured in the open, I think you said it was in buggies, the very first few feet on the job? A. In the south tunnel.

Q. And no part of the north tunnel?

A. No. The north tunnel was all shot, even the portal, with the Hackley gun.

Q. But it was in the open?

A. Part of it was in the open.

Q. I will show you a photograph of the left side of the west end of the south tunnel, taken on November 20, 1934. That was shortly after it was poured and before you had started driving again while the forms were taken out?

A. That is an open section, poured by buggies.

Q. That was poured by buggies? A. Yes. [909]

Q. And you had men working there at that time?

(Testimony of Lewis Michael Larson.)

A. Let me refresh my memory on that point. Mr. Price and Mr. Stephen Bechtel kindly gave me the right to run down and visit my family, who were living in Los Angeles at the time, and I know little of this.

Q. Do you remember seeing this open section of the concrete that you poured?

A. I don't recall that. There might have been some there, but if so I do not recall it now.

The Court: Where would this be, about?

A. That would be near the portal.

Mr. Tinning: That would be right behind the portal building.

The Court: Q. You poured that in buggies?

A. In concrete buggies.

Q. Is that in the arch? A. Yes.

Mr. Tinning: Q. That was out in the open. Here is the face of the hill, and the building was right here, 30 feet out in the open.

Mr. Tinning: We will offer this photograph in evidence as Defendant's Exhibit in the proper order.

The Court: It may be admitted and marked.

(The photograph was marked "Defendant's Exhibit L.")

[Set forth in the Book of Exhibits at Page 361.]

Mr. Tinning: Mr. Wittschen suggests that when we took our recess no order was made admitting it. May such an order be made?

The Court: Yes.

(Testimony of Lewis Michael Larson.)

Mr. Tinning: Q. I show you a photograph of the north side of the south tunnel, showing the concrete after the forms were removed, on November 20, 1934. Is that a fair representation of the condition of the concrete as it was disclosed on that portion of the tunnel that was poured in the open?

[910]

A. That was during my absence, too, but I know one thing, that it is better concrete than the buggy concrete.

Q. Better than the buggy?

A. It has that appearance.

Q. It shows those voids and rough spots?

A. It has rock pockets.

Q. It shows that there had been a segregation and at least at these points that the vibration did not result in homogeneous concrete mixing?

A. Yes, possibly due to the reinforcing preventing it, or lack of necessary amount of vibration.

Q. Maybe the men just missed that?

A. Yes, that is possible.

Q. But that was the result? A. Yes.

Q. That was placed by the Hackley gun?

A. That was placed by the Hackley gun.

Mr. Tinning: We offer this photograph in evidence, your Honor, as Defendant's Exhibit M.

The Court: Admitted.

(The photograph was marked "Defendant's Exhibit M.")

[Set forth in the Book of Exhibits at Page 362.]

(Testimony of Lewis Michael Larson.)

Mr. Tinning: Q. Did you see the concrete on the inside of the tunnel after the forms were stripped?

A. You are referring now to the 92 feet and 110 feet?

Q. Yes, we are dealing with that.

A. Yes, I stripped both of them so I naturally would see it.

Q. Were there any voids or rough spots in that concrete?

A. I have not any definite recollection of it, but it is not unusual in concrete; it would be rather surprising if it did not have some.

Q. Now, at the time you were doing this concrete work at the face, these two ring sections, how was the dirt moved from the tunnel to wherever it was finally deposited?

A. You are now again referring to the removal of the dirt in the 92 feet?

Q. We are confining our attention to that solely at this time. [911]

A. I think the majority, as I recall it, Mr. Tinning, most of the drift muck was carried from cars to cars and deposited directly into the fill. I won't say the most of it, but I think a good portion of it, and at a later period I think dumped into bunkers and hauled by trucks into the fill, but just the stage of the progress I have forgotten.

Q. Isn't it a fact that when you started your excavation there about August 23rd that you had

(Testimony of Lewis Michael Larson.)

a railroad system for the disposition of your earth that ran down along the District or the projected right of way some 2500 or 3000 feet, with a couple of trestles in it?

A. With Diesel locomotives, yes.

Q. That were used and designed to be used outside of the tunnel? A. Yes.

Q. And that at the beginning of your excavation the earth was placed in the muck cars and taken down this railroad track to the dump some 2,500 or 3,000 feet down the hill, down the valley, along the line?

A. That is substantially correct.

Q. You had a lot of trouble with that railroad, didn't you?

A. We had trouble with the Diesel engine, the equipment was faulty.

Q. They ran away going down the hill?

A. The brakes broke.

Q. And the cars would pile up? A. Yes.

Q. And your locomotives went off the track and your cars went off the track? A. Yes.

Q. And so you were delayed in getting the muck out of the tunnel at certain times, weren't you?

A. That may be true, but I am not sure that caused us any delay inside of the tunnel. I know it caused delay on the outside, but we had a reserve of cars, and it is my thought at the present time, without refreshing my memory on it, that it might have caused little or no delay inside.

(Testimony of Lewis Michael Larson.)

Q. Isn't it a fact that on several occasions the whole thing went [912] off the track, cars and engine, and you were tied up for six or seven hours while the locomotive was being placed back on the track?

A. I believe the time was greatly exaggerated, but I will admit that the out-haul locomotives and cars were derailed on either two or three or maybe four occasions, but we had another locomotive that was spotting cars in the tunnel, and that is why I feel reasonably sure that there might have been no delay to the tunnel work.

Q. Your testimony is now then that there was no substantial delay in the tunnel driving operation, in those two initial operations, by reason of the failure of the railroad equipment?

A. That is my recollection, Mr. Tinning.

Q. You said that when you were driving these tunnels that you had expected to place the concrete, to keep the concrete lining within 300 or 350 feet of the excavated face.

A. That was my thought in making the estimate, yes.

Q. When you left the job on April 30 you were in some 500 feet, weren't you? A. Yes.

Q. And the south tunnel was in approximately 100 feet further? A. 610, I think.

Q. And there had been placed in November, the latter part of November, concrete 92 feet at the

(Testimony of Lewis Michael Larson.)

mouth of the tunnel, the south tunnel, and 110 feet at the mouth of the north tunnel, so that there was approximately 400 feet of excavated and timbered and unlined tunnel in the north bore which you were in charge of, and approximately 500 feet in the south bore timbered and unlined tunnel?

A. I believe that is substantially correct.

Q. At that time there was no concrete steel form in either tunnel, was there?

A. No, not in the tunnel.

Q. They were not on the job, were they?

A. I believe not.

Q. You never saw them on the job before you left on April 30? [913]

A. My recollection is that I did not.

Q. And they were big enough when you did see them so that you would have known if they had been there? They were not concealed behind a pine tree or building somewhere?

A. That is true.

Q. They were not there, were they?

A. I believe they were not there.

Q. And when you returned to the job on August 29th there was approximately 1,000 feet of excavated tunnel in each of the bores, was there not—I am not talking about where it fell in.

A. Well, you may be approximately correct; I have the data on that but I have not in my mind.

Q. I do not think it is important to get the exact

(Testimony of Lewis Michael Larson.)

footage, but the statement that I made is a fair statement of the general condition, there was approximately 1,000 feet of each tunnel that had been excavated when you returned at the end of August?

A. I should say approximately.

Q. And did you observe how much concrete lining had been placed in the tunnel, or in either bore or both bores from the time that you left on April 30th and the time that you returned on August 29th?

A. I said in my previous evidence that I believed 80 feet in the north tunnel and between 200 and 300 feet in the south tunnel, and later I observed that there was some 70 feet in the north tunnel instead of 80 feet, and somewhere in the vicinity of a little bit under 200 feet additional in the south tunnel.

Q. So if the District records show that there was 160 feet of additional concrete in the tunnels at that time in addition to the original amount that you poured in October of the preceding year you would feel that those records would be wrong?

A. I would be inclined to think—are you taking the amount in both tunnels, or one?

Q. 160 feet in addition to what had been poured before, which [914] was distributed in the two tunnels.

A. I would be inclined to think that is under the amount. I am inclined to think from the company's records showing the date when the concrete was poured it shows more than that.

(Testimony of Lewis Michael Larson.)

Q. When was that first concrete poured in the steel forms in the tunnel?

A. That I could not recall now. I would have to go to my records for that.

Q. It was right around August 1, 1935?

A. I think some was poured—wasn't there some poured in June—it seems to me it was.

Q. Of course, you are testifying to something that you have been reading from in your preparations? A. Surely.

Q. I do not want to bind you on that, but your impression now is that concrete was poured in the tunnels in June?

A. It seems in the south tunnel it began in June. That is my recollection of the record.

Q. Isn't it a fact that the Six Companies did not have a concrete plant at the west portal set up for operation until the latter part of June, 1935?

Mr. Marrin: Why ask this witness all of these questions? He testified he was not there at that time. I think it is objectionable as calling simply for hearsay. He does not know about it.

Mr. Smith: He said he left there on April 30 and did not go back until August 29.

Mr. Marrin: I think these facts can be brought out clearly from other witnesses.

The Court: He has stated that he prepared himself as a witness by consulting the records, and he has testified to facts. He has testified in both capacities, and I think both sides recognize that, and

(Testimony of Lewis Michael Larson.)

probably counsel has that in mind, I do not know.

[915]

Mr. Marrin: I have no particular objection, your Honor, except that if Mr. Tinning is asking for facts—

The Court: Do you or do you not know any of these matters, "Yes" or "No"?

A. I don't know definitely.

Mr. Tinning: Q. But it is a fact that when you returned there that there had been a very small amount of concrete, and according to your statement around 300 feet poured in addition to what was poured in November of 1934 at the face?

A. I would say a little under 300, Mr. Tinning.

Q. A little under 300? A. Yes.

Q. That would mean that there were several hundred feet of full excavated tunnel with the timbers in it standing exposed to the air, and which could result in slaking and exfoliation for a period of seven or eight months?

A. You are speaking now, of course, of the time of the first exposure of the ground?

Q. Yes.

A. Yes, the period of time from the time the ground was uncovered up to the time of August that you speak of, will be approximately what you said.

Q. And during that period the materials in the tunnel were open to whatever effect air and moisture in the air could bring to them?

(Testimony of Lewis Michael Larson.)

A. Under the conditions that existed?

Q. Under the conditions that existed.

A. Yes.

Q. And the distance from the excavated face to the concrete was far in excess of 300 to 350 feet, was it not? A. That is true.

Q. And it was 700 or 800 feet?

A. You are probably correct, or approximately correct.

Q. Approximately correct? A. Yes.

Q. Do you consider as a tunnel expert that it was good practice to leave the tunnel standing timbered and unconcreted the period of time that you have just stated it remained in that condition?

[916]

A. If the conditions of placing concrete were under control, I would say it would be advisable to have followed closer with the concrete.

Q. Will you please read the question asked, Mr. Reporter, and will you please answer it "Yes" or "No", Mr. Larson, and then explain?

A. No, I do not, if the conditions, all the conditions are under control.

Q. Well, what conditions would you say prevented the placing of concrete in this tunnel? Was it the fact that there was no concrete plant ready until the end of June, 1935, or that there were no steel forms on the ground until the middle of June, 1935?

(Testimony of Lewis Michael Larson.)

A. No, I do not have that so much in mind, Mr. Tinning as I do that the unsatisfactory method—I say unsatisfactory, because I believe that was mutual between the Six Companies and the District—that a different manner of placing concrete would be desirable, and I am testifying now from the benefit of that information, that there was an effort to introduce a Pumpcrete method, and that was largely in its infancy, and I really believe it was developed to its present stage of efficiency in this very particular tunnel, but it required a good deal of preparatory work in the way of correspondence and discussions between the District Engineer and the Six Companies to effect that.

Q. You are now testifying to your conclusions from correspondence and records that you read?

A. Yes, from information that has come to me since.

Q. However, you knew at the time you prepared your estimate that the Pumpcrete method had been or was being used at the Boulder Tunnel?

A. Unsatisfactorily.

Q. Unsatisfactorily?

A. Yes, in filling the arch.

Q. Was there any condition that prevented the placing of concrete? [917] You had Hackley guns?

A. I do not know, Mr. Tinning. Of course, if we tied ourselves to 350 feet then I would have to admit that the forms were not ready at the time that we had reached the 350 feet, but I will also

(Testimony of Lewis Michael Larson.)

be fair to both parties and say that the form erection was also delayed, and, as I understand it, by the effort to get Pumperete equipment on the job. What other conditions controlled I am really not in a position to say.

Q. It is all again a conclusion from your consultation of records? A. That is correct.

Q. It was the contractor's duty to get the concrete in, was it not? The method that he used was, so long as he fulfilled the specifications, was his problem?

A. It was his problem to get the concrete in, that is true, by a method that would be satisfactory to the owners.

Q. That is, that would comply with the specifications?

A. That would comply with the specifications.

Q. In other tunnels you had used the Hackley gun and had been able to comply with the specifications and get a good job?

A. That is true, but we were not tied down, in fairness, we were not tied down to the same specifications that we were in this particular instance; in all previous jobs, in the Hollywood Tunnel, for example, we were permitted to pour one wall and then finish up pouring the arch, and in the Claremont Tunnel to pour from the center and allow it to flow down the side.

Q. The Claremont Tunnel was not comparable

(Testimony of Lewis Michael Larson.)

—it was a water tunnel, and it was about the same size as one of these drifts?

A. It was not comparable in size, no, Mr. Tinning.

Q. The Hollywood Tunnel was comparable in size, was it?

A. Except for height.

Q. And the height was what caused you your trouble with the Hackley [918] gun, was it not?

A. No, I would not say that, that would not be a fair conclusion; it was not the height alone that gave us the trouble. We would have had the same trouble if we had taken one of these contracts and been compelled to deflect the concrete in the manner prescribed by the specifications. I am not going to say that the method was wrong or that it was an unreasonable requirement. I am trying to answer your questions intelligently. I—

Q. (Interrupting) It was a requirement—

Mr. Smith: Just a minute, let him finish.

Mr. Tinning: He stopped, and I thought he had finished. I am sorry. What were you going to say?

A. I have forgotten my drift. Go ahead with the next question.

The Court: We will take an adjournment now until tomorrow morning at ten o'clock.

(An adjournment was here taken until tomorrow, Friday, April 22, 1938, at ten o'clock a. m.)

TRANSCRIPT OF RECORD

Supreme Court of the United States

OCTOBER TERM, 1940

No. 267

SIX COMPANIES OF CALIFORNIA, HARTFORD ACCIDENT AND INDEMNITY COMPANY, ET AL., PETITIONERS,

vs.

JOINT HIGHWAY DISTRICT No. 13 OF THE STATE OF CALIFORNIA

ON WRIT OF CERTIORARI TO THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE NINTH CIRCUIT

PETITION FOR CERTIORARI FILED JULY 22, 1940.

CERTIORARI GRANTED OCTOBER 14, 1940.

NO. 9113

United States

Circuit Court of Appeals

For the Ninth Circuit.

SIX COMPANIES OF CALIFORNIA, a corporation, and HARTFORD ACCIDENT AND INDEMNITY COMPANY, a corporation, FIDELITY AND DEPOSIT COMPANY OF MARYLAND, a corporation, THE AETNA CASUALTY AND SURETY COMPANY, a corporation, INDEMNITY INSURANCE COMPANY OF NORTH AMERICA, a corporation, AMERICAN SURETY COMPANY OF NEW YORK, a corporation, MARYLAND CASUALTY COMPANY, a corporation, UNITED STATES FIDELITY AND GUARANTY COMPANY, a corporation, THE FIDELITY AND CASUALTY COMPANY OF NEW YORK, a corporation, GLENS FALLS INDEMNITY COMPANY, a corporation, STANDARD SURETY AND CASUALTY COMPANY OF NEW YORK, a corporation, STANDARD ACCIDENT INSURANCE COMPANY, a corporation, MASSACHUSETTS BONDING AND INSURANCE COMPANY, a corporation, CONTINENTAL CASUALTY COMPANY, a corporation, and NEW AMSTERDAM CASUALTY COMPANY, a corporation,

Appellants,

vs.

JOINT HIGHWAY DISTRICT NO. 13 OF THE STATE OF CALIFORNIA, a public corporation,

Appellee.

Transcript of Record

In Eight Volumes

VOLUME IV

Pages 983 to 1470

Upon Appeal from the District Court of the United States for the Northern District of California, Southern Division.

PARKER PRINTING COMPANY, 543 SANSOME STREET, SAN FRANCISCO

Friday, April 22, 1938;
10:00 o'clock a. m.

LEWIS MICHAEL LARSON,

Cross-Examination (continued).

Mr. Tinning: Q. Mr. Larson, yesterday, when we were discussing the placing of concrete in the forms, you understood me to mean in horizontal layers, did you not? A. Yes.

Q. I used the word "vertical"; and, in running through the testimony, this morning—

A. Yes; I thought I knew what you intended.

Q. I did not know I said that. I meant—

A. Horizontal layers.

Q. Yes. And your answers, in other words, showed you understood it so? A. Yes.

Q. You stated that you proposed, in the excavation, in the placing of timbers in the tunnels, to place, or to leave, the timbers in the Monterey sandstone and the opening, or portal section, of the tunnels, and to remove the timbers in the cherts and the Orindan—That was your testimony?

A. Yes.

Q. And we understood it, with respect to Plaintiff's Exhibit No. 27, Section "AA" and Section "BB," that way? A. Yes.

Q. I would like to show you revised schedule submitted by Six Companies of California to the District, with a letter dated August 9, 1934. This revised schedule was submitted, if I recollect your testimony, before you had gone underground, except with possibly the two center drifts that we

(Testimony of Lewis Michael Larson.)

were looking at in the photograph yesterday? If you will look to the left, "Company Work Tunnel Proper," you will find an excavation schedule which shows that you, at that time, intended, or had planned, at the time this was made up, even though it was presented on August 9th, to commence excavating in the west [920] portal of the tunnels, on July 20, 1934, and finish that work by September 5th; and the figure that was contemplated, under your proposal that you have outlined, was 40 feet in each of those portals. Will you please examine the number of yards that appear as the contemplated quantity of that total of 80 feet in the two tunnels,—3,145 cubic yards? It is a fact, is it not, Mr. Larson, that there were, in the neat sections—there were 35.6 cubic yards of material?

A. I believe that is correct.

Q. And it is a fact, is it not, that the figure of 3,145 cubic yards in the west portal section of 80 lineal feet is just 10 per cent more than 35.6 yards per foot?

A. I would have to reduce that to—

Q. Well, I have; but, if you would like to do it and check me, it would probably be advisable. Would you like a piece of paper?

A. Yes. That shows in excess over the neat.

Q. In other words, 10 per cent in excess of the neat or net quantity of excavation. It is likewise true, is it not, that the Monterey Sandstone shows the same thing? A. It appears so.

(Testimony of Lewis Michael Larson.)

Q. And likewise true that the Claremont cherts shows the same thing? A. So it appears, yes.

Q. It is likewise true the Orindan shown the same thing?

A. That is true, it appears so.

Q. So that the estimated quantity of excavation was exactly the same in the section of the tunnel in which you planned to leave the timbers as it was in those in which you planned to remove them?

A. That is true.

Q. And your schedule, at that time, submitted on August 9, 1934, shows that you planned to commence placing concrete on the 15th day of August, 1934, and to complete doing so on the 31st day of July, 1935—You will look at the black line there—

[921]

The Court: I am afraid you will have to assist me with this schedule.

Mr. Tinning: Well, your Honor, I will have to—need assistance, myself, because I read the wrong line; it is a combination of bifocal glasses and cross section paper.

Q. If you will look, Mr. Larson, at the heading "Concrete Walls and Arch," and then follow, off to the right, along the black line, you will find—Maybe you can do much better?

A. Your Honor, the line I was trying to show is here.

Mr. Tinning: It was misstated in my question.

(Testimony of Lewis Michael Larson.)

Q. The line opposite "Walls and Arch,"—that is the concrete lining, is it not, Mr. Larson?

A. Yes.

Q. I, instead of starting at the date that I stated in my former question—it is shown on this revised schedule, on August 9th—it commenced September 5, 1934, and planned to finish September 10, 1935.

The Court: Oh, I see.

Mr. Tinning: The dates are above that. Here is September. This line comes to the 10th; each one of those is a five-day period.

The Court: Yes, I understand.

Mr. Tinning: Here is the 5th day of September, and the 6th day of September.

The Court: I see.

Mr. Tinning: Q. After your assistance, my statement of what that schedule shows, with respect to the proposed time, is correct, is it not, Mr. Larson? A. Yes.

Mr. Tinning: If the Court please, we will offer the letter and schedule of August 9, 1934, submitted by Six Companies of California to the District named, as defendant's exhibit in proper order.

[922]

(The document was marked "Defendant's Exhibit N.")

[Set forth in the Book of Exhibits at page 363.]

Mr. Tinning: Q. I will show you revised schedule of proposed construction submitted to Joint Highway District by Six Companies of California

(Testimony of Lewis Michael Larson.)

on February 12, 1935, Mr. Larson. I will ask you if you will observe the figures on the left, under "Company Work Tunnel Proper Excavation." Those figures are the same as on the schedule of August 9, 1934, are they not?

A. I believe they are.

Q. And, to save time, they also include exactly the same 10 per cent beyond the neat excavation line; they are the same, Mr. Larson, are they not?

A. Yes, I think they are.

Q. And show that, in the schedule submitted on February 12, 1935, the amount of excavation contemplated, in the west portal section, Monterey sandstone, Claremont cherts and Orindan, was all the same?

A. Was that a statement or a question?

Q. I am saying that the amount per lineal foot was estimated to be the same.

A. It was estimated to be the same.

Q. Yes. A. Yes.

Q. One other question in connection with that schedule, Mr. Larson: If you will look off to the right this time from the heading "Walls and Arch," you will see that that work was scheduled to start May 1, 1935?

A. You are thinking now, Mr. Tinning, I suppose, of the continuation with the lining?

Q. Yes. There is shown, on the schedule, between November 15th and December 15th, a short line covering a period of one month, which covers

(Testimony of Lewis Michael Larson.)

the installation of the concrete in the first 110 feet in the north side, and 92 feet in the south portion?

A. Yes.

Q. Then the line is broken, and shows the resumption, or the planned resumption, of the concrete placing in the tunnel lining on the first day of May, 1935, and shows the contemplated finishing of the [923] lining on April 15, 1936?

A. April 10th, isn't it, Mr. Tinning, rather than the 15th—if that is material?

Q. It is material; but my bifocals are not very good. Each one of these squares is 5 days. As a matter of fact, you left the work on the day before this schedule shows it was intended to resume the concreting? A. I left on April 30th.

Q. And the schedule shows that it was intended to commence concreting on May 1st; and, when you left, there were no steel forms on the job for the concreting? That is correct, isn't it?

A. That is correct.

Mr. Tinning: We will offer this schedule of February 12, 1935, together with a letter dated February 12, 1935, from Six Companies of California to the District, as defendant's exhibit in proper order.

(The documents were marked "Defendant's Exhibit O.")

[Set forth in the Book of Exhibits at page 367.]

Mr. Tinning: Q. Mr. Larson, when you were testifying here some days ago with reference to the

(Testimony of Lewis Michael Larson.)

specifications and your understanding of them, you read a portion of Paragraph "B" in Section 32, from page 59 of the Specifications.

Mr. Trefethen: May I have that note again? Paragraph what?

Mr. Tinning: Portion of Paragraph "B", Section 32, page 59.

Q. You read a sentence that commences—It is in the right-hand column—You said this sentence was one of the things that caused you to conclude, because it required, or provided for, the removal of timbers—caused you to conclude that it was contemplated that the material throughout the tunnel would be in self-supporting ground. The sentence you read, or the portion that you read, as I have it marked—and I think it is complete—says:

> "Where timber is employed for tunnel timbering it shall be removed before any concrete is placed, and any spaces outside the neat lines of the concrete structure caused by such removal shall be filled [924] with concrete as above provided. In the event that it is found impracticable, in the opinion of the District Engineer, to remove timbering or portions thereof, such timbering may be allowed to remain permanently in place, but in no case shall such timber so remaining be allowed to project into the neat lines of the concrete structure. Where timber is permitted to remain, all spaces outside of the neat lines of the concrete

(Testimony of Lewis Michael Larson.)

structure shall be filled with concrete mixed in the same proportions and placed at the same time as the concrete in the neat structure. If structural steel shapes are used for tunnel sets they may be allowed to remain permanently in place provided that they do not project into the concrete more than four inches (4") beyond said neat lines of the concrete structure."

When you worked on some of the estimates that you prepared for other tunnel jobs, do you recollect that you found similar provisions in the specifications?

A. Are you referring now to the Broadway Tunnel?

Q. No. I said for other estimates on other jobs. You know, we have been at this a long time, and we are talking about some other tunnels here at other stages in this proceeding? A. Yes.

Q. For instance, you said you prepared an estimate on the Sunset Tunnel? A. Yes.

Q. You prepared them on several other tunnels?

A. Yes.

Q. Isn't it true that what I have read here is stated in all specifications for tunnels in substantially the same language?

A. I am not prepared to answer "Yes" to that, Mr. Tinning. I would have to trust entirely to my memory. My memory might be at fault.

Q. Do you remember this provision in the specifications for the Sunset Tunnel—and I am reading

(Testimony of Lewis Michael Larson.)

from page 25, gentlemen, of the specifications for the construction of a tunnel known as Buena [925] Vista Tunnel, San Francisco Specifications No. 14646. The sections are not numbered in this set; the best I can do is give you the page:

"All sheet piling, lagging, bracing, shoring or timbers shall wherever practical be removed from the excavation except where the City Engineer shall expressly order the same to be left in place. All vacancies left by the removal of sheet piling, lagging, bracing, shoring or timbers shall be backfilled as herein specified. The contractor shall be responsible for any injury which may result to the work or any other structure by the removal of lagging and bracing."

Do you remember that provision?

A. I would not; that is too long since.

Q. When you prepared the estimate, were you led to believe, by reading the provisions of the specifications, that you could expect to find self-supporting ground as you drove through the Sunset Tunnel? A. I cannot recall——

Q. Would you answer "Yes" or "No"—Were you led to believe——

A. I cannot remember.

Mr. Smith: He says he cannot remember. That is an answer, Mr. Tinning.

Mr. Tinning: Q. You cannot remember?

A. I cannot remember; that is too long since, and I don't remember, right now, whether there

(Testimony of Lewis Michael Larson.)

was a geological report to help bring out that thought.

Q. All the timbering was left in, in the Sunset Tunnel, was it not? A. I don't remember.

Q. Isn't it a fact that you stated, earlier in your testimony, that where the timber was taken out, where such a provision appeared in the specification, that you believed then that the ground must be self-supporting?

A. I referred to the Broadway Tunnel, [926] coupled with the geological report, in making that statement.

Q. In other words, it is the geological report that you need to draw your conclusion, not the specifications? A. Both.

Q. Both? A. Both.

Q. Why, if you need both, would you say, if there was no provision for a geological report on the Sunset Tunnel, that this provision did not mislead you?

A. I cannot remember my conclusion on the Sunset Tunnel; and I am really not prepared to make any definite statement as to what my thoughts were on it.

Mr. Tinning: Gentlemen, we would like to offer this section that I have just read in my question.

Mr. Smith: Offer the whole thing.

Mr. Tinning: Well, we would be glad to do that, but the only thing is I cannot provide you with a copy. This is the only copy we have. I would like

(Testimony of Lewis Michael Larson.)

to offer that in the record. I will have this whole thing photostated.

Mr. Smith: We are interested in the whole thing.

Mr. Wittschen: The witness testified that he figured the Sunset Tunnel, and he also testified, in his earlier statements, that, wherever the timber was to be removed, he assumed the ground was self-supporting; and he also testified, previously, he has forgotten it today, that the Sunset Tunnel—it was not self-supporting,—a great portion of it. All we want to put in is the pertinent portion of the Sunset Specifications. Why put in reams that don't apply to this part of the case or the witness' testimony?

Mr. Marrin: There may be other provisions of the specifications bearing on that.

Mr. Wittschen: We will permit you to examine them, and you can offer any part you want. We are not objecting. [927]

Mr. Tinning: We have no objection to that, your Honor; but it happens this is an old document; this is the one copy that we have, but I will be glad to have it go in so the record here will be complete; and I will propose, by next Tuesday morning, to have photostatic copies of the—

Mr. Wittschen: That is quite a job. You can leave them that book and let them put in what portions they wish.

The Court: Let them examine it. You can make

(Testimony of Lewis Michael Larson.)

some arrangement between you to let them examine it; and if there is anything that has any relation to the subject matter, they will have an opportunity to offer it.

Mr. Tinning: I offer in evidence the portion of the Sunset Tunnel Specifications No. 14646, of the Department of Public Works of the City and County of San Francisco, appearing on page 25—

Mr. Marrin: Is it dated on the outside, Mr. Tinning?

Mr. Tinning: September, 1922—appearing on page 25; which I have read, and which I will now read again:

> "All sheet piling, lagging, bracing, shoring or timbers shall wherever practical be removed from the excavation except where the City Engineer shall expressly order the same to be left in place. All vacancies left by the removal of sheet piling, lagging, bracing, shoring of timbers shall be backfilled as herein specified. The contractor shall be responsible for any injury which may result to the work or any other structure by the removal of lagging and bracing."

If it may be introduced in this manner, it is satisfactory.

The Court: Yes; it is in the record

Mr. Tinning: I understand there will be no number given to this because it is in the record.

(Testimony of Lewis Michael Larson.)

Mr. Marrin: Will you let us have it over the weekend, Mr. Tinning?

Mr. Tinning: Yes. [928]

Q. When you were preparing your estimate for a bid on the Claremont Tunnel did you have in mind a provision in the specifications which appeared as Sections 65, 66 and 67, specification for the Mokelumne River Project, Claremont Tunnel of the East Bay Municipal Utility District?

Mr. Smith: What is the date of that?

Mr. Tinning: Apparently there is no date. April 2, 1926 is the date that appears on the advertisement calling for bids:

> "The tunnel shall in all cases, be excavated in such a manner and to such dimensions as will give suitable room for the necessary timbering, lining, ventilating, pumping and draining. The contractor shall use every reasonable precaution to avoid excavating beyond the outside lines of permanent timbering and beyond the outside neat concrete lining where timber is required. All drilling and blasting shall be carefully and skillfully done so as not to shatter the material outside the required lines. The contractor shall avoid blasting that might injure the work, or adjacent property, and any damage done by blasting shall be repaired by the contractor at his expense, and in a manner satisfactory to the engineer. Wherever the

(Testimony of Lewis Michael Larson.)

grade of the tunnel at the west portal is within 200 feet of the ground surface, the excavation shall be so performed as to disturb the residents as little as feasible. Blasting shall be done between the hours of 8 A. M. and 8 P. M. with light charges, subject to approval of the engineer. The tunnel will be paid for by the Linear foot at the price bid therefor under item 1, which shall include excavation, temporary and permanent timbering, backfilling and all work incidental to a completed tunnel, except that cement, reinforcing steel and concrete, exclusive of cement and reinforcing steel, will be paid for under the provisions of paragraphs 52, 53, and 63 respectively." [929]

It thus appears in this specification that I just read, Mr. Larson, that timbering was not something that was not to be paid for extra, as I believe you stated it was.

A. That is my recollection.

Q. This refreshes your mind that the price per foot was just as it was in the Broadway Tunnel, a lump sum? A. Yes.

Q. "66. Timbering. Suitable timbering and lagging shall be used to support the tunnel sides and roof whenever necessary. If practicable, this timbering shall be removed before the construction of the concrete lining. Timbering left in place must be placed in such a

(Testimony of Lewis Michael Larson.)

manner as not to weaken the concrete lining and must be in accordance with designs approved by the engineer. Approved designs for such permanent timbering are shown on the drawings, but in case the designs are found to be inadequate, they may be modified from time to time, subject to the approval of the engineer. Lumber for timbering shall be furnished and placed by the contractor at his own expense. The cost of furnishing and placing timbering shall be included in the price bid per linear foot for excavating the tunnel. Nothing herein contained shall prevent the contractor from placing such temporary timbering as he may deem necessary for safety, or from using heavier timbering than that shown on the drawings, or shall be construed to relieve the contractor from sole and full responsibility for the safety of the tunnel and from damage to person and property."

Now, was there anything in those provisions of the specifications which I have just read to you, Sections 65 and 66, that caused you to believe that the material in the Claremont Tunnel would be self-supporting?

A. No, I must say this, Mr. Tinning, that there is no definite statement there in the specification that material would be self-supporting; there is an indication [930] that we may run into some of it

(Testimony of Lewis Michael Larson.)

that would be self-supporting but the provision that you have read departed in one particular from the Broadway Tunnel, in which, when the timber should be left in place it must meet the approval of the District, and that they would furnish plans for such timber rather than the specification—

Q. They would furnish the design?

A. The design, yes.

Q. And I believe they did, and you furnished a substitute design which they consented to?

A. That is true.

Q. And the specification provided that it might be put on the approved design? A. Yes.

Q. Isn't it a fact that in the Broadway Tunnel that the timbers could remain in with the approval of the District Engineer?

A. Yes, it had to have his approval.

Q. Isn't it a fact, Mr. Larson, that there is nowhere in this Broadway Tunnel specification that it says that the ground is self-sustaining? In your previous answer you said that there was nowhere in the Claremont Tunnel specification that it stated that; it is also true about these Broadway specifications?

A. I wish to say it this way, there is not in the Broadway specifications, as I remember, any direct statement that the ground will be self-supporting.

Q. I wanted to clear that up, because your previous answer indicated that might be your basis.

(Testimony of Lewis Michael Larson.)

All of the direct statements that you referred to as having caused you to believe that this ground would not require timbering in the majority of the material encountered come from the geological report, do they not?

A. Yes, directly and indirectly. It appears to me that was the conclusion of all the parties.

Q. Mr. Larson, I wish you would answer my question before you start explaining.

A. I thought I had. [931]

Q. I am talking about the geological report, and I ask you if it is not a fact that the only place that anything appears where there is a direct statement with respect to the material to be encountered is in the geological report?

A. Yes, the geological report is the only place where it states the ground will be self-supporting, but what I am trying to bring out is undoubtedly that same interpretation was put on it by all parties in order to bring out that specification, and it is because of that statement in the specifications that I was influenced to believe that everybody viewed it in the same light. That is why I tie the specification and the geological report together.

Q. You are now stating a conclusion, your conclusion, and we ask, if your Honor please, that the witness' answer go out because I asked him with respect to where there was a definite statement.

The Court: It may go out.

(Testimony of Lewis Michael Larson.)

Mr. Tinning: If your Honor please, we offer in evidence Sections 65 and 66 on behalf of the defendant from the specifications of the Mokelumne River Project, California, Claremont Tunnel, East Bay Municipal Utility District, upon which bids were opened May 14, 1926 in Oakland. I would like to read the sections into the record. May it be stipulated that the reporter can copy Sections 65 and 66?

Mr. Marrin: Yes.

(The Sections referred to are as follows):

"Section 65. Excavation. The tunnel shall in all cases, be excavated in such a manner and to such dimensions as will give suitable room for the necessary timbering, lining, ventilating, pumping and draining. The contractor shall use every reasonable precaution to avoid excavating beyond the outside lines of permanent timbering and beyond the outside neat concrete lining where timber is required. All drilling and blasting shall be [932] carefully and skillfully done so as not to shatter the material outside the required lines. The contractor shall avoid blasting that might injure the work, or adjacent property, and any damage done by blasting shall be repaired by the contractor at his expense, and in a manner satisfactory to the engineer. Wherever the grade of the tunnel at the west portal is within 200 feet of the

(Testimony of Lewis Michael Larson.)

ground surface, the excavation shall be so performed as to disturb the residents as little as feasible. Blasting shall be done between the hours of 8 A. M. and 8 P. M. with light charges, subject to approval of the engineer. The tunnel will be paid for by the linear foot at the price bid therefor under item 1, which shall include excavation, temporary and permanent timbering, backfilling and all work incidental to a completed tunnel, except that cement, reinforcing steel and concrete, exclusive of cement and reinforcing steel, will be paid for under the provisions of paragraphs 52, 53, and 63 respectively."

"Section 66. Timbering. Suitable timbering and lagging shall be used to support the tunnel sides and roof whenever necessary. If practicable, this timbering shall be removed before the construction of the concrete lining. Timbering left in place must be placed in such a manner as not to weaken the concrete lining and must be in accordance with designs approved by the engineer. Approved designs for such permanent timbering are shown on the drawings, but in case the designs are found to be inadequate, they may be modified from time to time, subject to the approval of the engineer. Lumber for timbering shall be furnished and placed by the contractor at his own expense.

(Testimony of Lewis Michael Larson.)

The cost of furnishing and placing timbering shall be included in the price bid per linear foot for excavating the tunnel. Nothing herein contained shall prevent the contractor from placing such temporary timbering as he may deem necessary [933] for safety, or from using heavier timbering than that shown on the drawings, or shall be construed to relieve the contractor from sole and full responsibility for the safety of the tunnel and from damage to person and property."

Mr. Alexander: You mentioned 67.

Mr. Tinning: I did not read that, I did not think it was necessary.

Q. You prepared an estimate on the Figueroa Tunnel, too, did you not? A. I did.

Q. I will read to you now from page 39 of the Figueroa Street Tunnel specification. I do not have the date of this document. I have a photostatic copy.

A. Are you speaking, Mr. Tinning, of the last Figueroa street tunnel, because there was an earlier one.

Q. I am speaking of the three tunnels.

A. The three tunnels.

Q. Those, I think, are the ones you referred to as the ones on which you prepared an estimate. Do you remember that when you prepared the estimate you read this provision of the specification:

(Testimony of Lewis Michael Larson.)

"If wood is employed for tunnel timbering it shall be sound Douglas Fir and no second hand lumber shall be used. So far as is practicable all wooden members of the timbering shall be removed before the concrete is poured. Where found necessary in the Engineer's opinion, timbering, or portions thereof, may be allowed to remain permanently in place, but, in no case will any wooden piece so remaining, be allowed to project into the concrete in the direction of the center of the tunnel beyond the extrados line as shown on Sheets 2 and 3 of the drawings. If structural steel shapes are used for the ribs of the tunnel sets they may be allowed to remain permanently in place and may project not to exceed eight (8) inches into the concrete beyond said extrados line in the direction of the center [934] of the tunnel."

As I understand the extrados line is the exterior of the neat concrete lining?

A. That is correct.

Q. Did you, in preparing your estimate for this bid you worked on have in mind this provision that I have just read to you from the Figueroa street specification?

A. I must say yes, because while I do not remember now what I might have done at that particular time, I read the specification and must have had that in mind.

(Testimony of Lewis Michael Larson.)

Q. Did you believe from reading that provision of the specification that the material to be encountered in the Figueroa street Tunnel would be self-supporting?

A. I would hardly think so, but at the present time I could not just remember what my thoughts were at that time.

Q. When you read the specification of the Broadway Low Level Tunnel you said that they caused you to believe that the material which you were to pass was to be self-supporting in the majority of the tunnel.

A. They helped me to believe it, yes.

Q. And because it said that the wood timbering should be removed, if it could be, you assumed that there would be a large part of the tunnel which would not require support?

A. Not alone from the specification, Mr. Tinning.

Q. The specification was part of the thing upon which you based your judgment, was it not?

A. That, coupled with the geological report.

Q. This was one of the indirect things then in the specifications in distinction to the direct statement you claim in the geological report which led you to believe that the ground would be self-supporting throughout the larger part of the tunnel?

A. It helped strengthen my belief to that extent.

[935]

Q. Your belief was based on these specifications and upon the geological report?

(Testimony of Lewis Michael Larson.)

A. That is correct.

Q. And you knew in the Broadway Tunnel, and you knew in the Figueroa Tunnel, and in the Claremont Tunnel, and in the Sunset Tunnel, and in all tunnels of this type, that it was in the power of the engineer to have the timber removed if it was practical to do so?

A. In general I believe that is correct.

Q. And the practice in general was also followed in the Broadway specification, was it not?

A. Probably, yes.

Q. Mr. Larson, following your work in connection with the preparation of the estimate for the tunnels you went away and were mining for some time? A. Yes, after the 30th of April.

Q. You prepared a bid——

Mr. Smith: Just a minute now, I think the witness misunderstood the question. You say that following his preparation of the estimate he went away mining. He did not. A. No, I did not.

Mr. Tinning: I was trying to bring in the historical set-up. You were employed in and about the work until April 30, 1935, and then you came back in September, or the 29th of August, and remained there until about the 1st of December, and then you were away from the tunnel for some time following that date?

A. That is approximately correct.

Q. And you visited the tunnels again, as I understand it, sometime in August or September of 1936, after the Six Companies had quit?

(Testimony of Lewis Michael Larson.)

A. I did visit it after the Six Companies had quit.

Q. And at that time you have already testified you were preparing an estimate for a bid on the completion of the tunnel? A. That is a fact.

Q. Did you call upon Mr. Wallace B. Boggs, District Engineer of the District, on the 26th of August, 1936, to discuss the work [936] that remained to be done?

A. I remember calling upon him but I do not remember the date.

Q. The purpose of your call was to discuss the work, was it not?

A. That was the purpose of the call.

Q. And in the conversation that you had with him you told him that you were preparing a bid for some undisclosed contractor?

A. I believe I did not state who the contractor was——

Q. Even though at that time——

A. Pardon me, might I finish my answer—because I had to be clear in my answer—are you speaking now of the first call for bids after the Six Companies quit, or the second?

Q. I do not know whether you called on Mr. Boggs later, but the time I am referring to is the occasion when you called at his office at 1448 Webster street, the District Office, and saw him, and to refresh your memory further, do you remember that while you were with Mr. Boggs, shortly after you started to talk to him, that Mr. A. Kempkey,

(Testimony of Lewis Michael Larson.)

one of the District Consulting Engineers, came into the room?

A. I think that was on the second call for bids, as I recall it.

Q. According to the District records it was the 26th of August, 1936, and that was before the bids were received, and it was the time that examination was being made of the District work to be done, in the completion, by a number of contractors; that is the date of the conversation which I refer to, and it was on the afternoon of August 26, 1936, Mr. Larson.

A. In that event, I think I had no direct association with the contractor, at that stage of the game; that is my recollection now.

Q. And on that date you made a deposit and secured a set of plans and specifications?

A. I did make a deposit and secured a set of plans. I don't remember the date. [937]

Q. You said that you were preparing an estimate for a bid for some unknown contractor, or for some contractor, and you did not name him—I do not mean you used the term "unknown contractor."

A. I do not know whether I specified I was doing it for a contractor or in anticipation of having a contractor.

Q. In that conversation it is a fact, as you stated to Mr. Boggs, that you thought the Six Companies' greatest trouble on the job was too many bosses?

(Testimony of Lewis Michael Larson.)

A. I don't remember that conversation.

Q. You don't remember that statement?

A. I do not.

Q. You remember that a conversation occurred that day?

A. I remember that I had a conversation with Mr. Boggs then and subsequently, but I do not remember any such a conversation.

Q. And that apparently Board Meetings had to be had to settle on any matters of method and equipment to be used in the tunnel?

A. I believe that is a misstatement.

Q. You don't remember such a statement?

A. I don't remember any such remarks.

Q. And that those Board Meetings of Six Companies' people usually developed much difference of opinion as to methods and equipment to be used?

A. I would not know that.

Q. You did not make that statement?

A. I believe I did not make that statement; to the best of my recollection I did not make that statement.

Q. And did you at that time in that conversation with Mr. Boggs, state that the termination of your work with the Six Companies on April 30, 1936, was due to your own disapproval of the methods which you were then required to follow in doing the work in the tunnel?

A. I do not think so, because it would be an untrue statement.

(Testimony of Lewis Michael Larson.)

Q. You did not make that statement?

A. I do not believe I did.

Q. You believe you did not?

A. I believe I did not. [938]

Q. Did you further state in the presence of the people mentioned at the time stated that you never considered that you had been deceived as to ground conditions by representations made in the geological report or the specifications?

A. I am reasonably confident I made no such statement, because that has never been my thought.

Q. Did you then state that the caves-in were unnecessary and avoidable?

A. I believe I did not.

Q. Did you at that time and place state in discussing the preparation of your estimate made for a bid, for use by the Six Companies, that it had been reduced about $200,000 by Mr. Steve Bechtel?

A. I did not make the statement in that way. I know that the matter had been discussed at various times, but I did not state that the estimate was reduced. I may have admitted that there were differences of opinion as to the bid amount.

Q. Did you state at that time and place that the amount that you had estimated for the tunnel work, the estimate that you prepared in 1934 had been reduced $200,000 or thereabouts by Mr. Steve Bechtel, in making the bid?

A. I have no recollection that I made any such statement.

(Testimony of Lewis Michael Larson.)

Q. Did the bid reduce your estimate?

A. I have never made a page by page comparison at the present time, but I believe that the bid did not, that is, I believe that the estimate was not materially reduced. That is my present belief.

Q. Did you also in that conversation state in respect to the estimate that you had made that you had also made an estimate of the Fort Peck Tunnel for some of the Six Companies group?

A. I can't remember whether I made that statement or not.

Q. And much lower figures were received from other bidders so that you had the reputation with Mr. Steve Bechtel at least of [939] being a high estimator?

A. I believe not. I am not inclined to boast.

Q. You then state that you did not make such a statement? A. I am positive I did not.

Q. Did you state at that time and place that in the preparation of the estimates of the Six Companies in 1934 upon which this contract was let, that two other units of Six Companies prepared estimates for discussion amongst themselves, one being the Utah Construction Company and that those estimates were higher than the figure used for the actual bid?

A. I do not remember having made that statement, but it is a fact that the Utah Construction estimate was higher than my estimate.

(Testimony of Lewis Michael Larson.)

Q. And at that time when you were discussing this matter about the reduction by Mr. Bechtel, you state you do not recall that?

A. I do not remember that. I doubt very much whether I made any such statement.

Q. At the time that you had this discussion with Mr. Boggs and Mr. Kempkey did you then state in their presence that Mr. Bechtel had reduced your estimate of the cost of the tunnel work in the figures that he submitted in Six Companies' bid for doing the tunnel work?

A. I could not have made that statement, and do not believe I made the statement, because I did not know until the day before yesterday what the true facts were. I doubt that I made that statement.

Q. You doubt it? A. Yes.

Q. Did you at the time that the bid of the Six Companies was being prepared protest that your estimate was cut or reduced by the figure which was submitted as a bid on the tunnel job?

A. Not as you state it.

Q. What did you do?

A. 'I discussed with other members of the group [940] the amount that was offered as a bid price. It was my thought that the price should be raised.

Q. Did you state to Mr. Boggs and to Mr. Kempkey on August 26, 1936, that at the time that Mr. Bechtel told you he was going to reduce his bid figures for the tunnel work below the amount of

(Testimony of Lewis Michael Larson.)

your estimate—did you also state to them when you had protested and objected that Mr. Bechtel had said to you that you had done the job and that he, Mr. Bechtel, and the remaining members of the Six Companies group were going to make the bid?

A. I made no such statement, not as you are stating it.

Q. Did you at the time and place mentioned, August 26, 1936, state to the persons present that you and Mr. Fontaine were in close agreement, and that Mr. Bechtel tried to get Mr. Fontaine to take a financial interest in the job, but that he had refused and was thereafter replaced by Mr. Price?

A. I doubt that very much—pardon me, might I explain? I want to make this thing clear, that I did not know what Mr. Fontaine's position was with regard to the Bechtel people, and, furthermore, the implication there is, as I understand it, that Mr. Fontaine was relieved from the position because he would not become an interested member. That is far from the fact.

Q. I am asking you if you made that statement.

A. I did not make any such statement.

Q. Did you at that time state that the Bechtels were hot for their job and that it was generally talked among Six Companies' employees that the rest of the group had decided to give them a lesson in contracting?

A. I have no recollection of that remark.

(Testimony of Lewis Michael Larson.)

Q. Did you at that time and place state that the Shea Company apparently were little interested in the work at the time you left the job?

A. I have no recollection of making any such remark. [941]

Q. Now, as I understand your position with respect to this matter the geological report was ignored by you except as to the general conditions appearing at the end of the report.

A. That was the controlling factor.

Q. In other words, you took the general conditions and interpreted them as you have stated at length, and wholly ignored the other matters and details, discussions and predictions of material to be encountered that appeared in the earlier pages of the portion of the report that you had?

A. Yes, in so far as those general provisions gave a definition to the generalities that preceded it.

Q. When you were preparing your estimate in this matter you had in mind all of the provisions of paragraph (e) of Section 32 of these specifications for the Broadway Tunnel?

Mr. Smith: What page is that?

Mr. Tinning: Page 60——

Q. Is that correct, all of the provisions of the Timbering Section?

A. Unquestionably I had.

Q. You also had in mind, did you not, that payments for the work in the tunnel, Broadway Tunnel, would be on the same basis as it was in the Clare-

(Testimony of Lewis Michael Larson.)

mont Tunnel, except that the contractor here would be required to furnish all material, while in the Claremont Tunnel I believe the concrete was furnished by the owner. You remember that, do you not?

A. I do not remember the details of the Claremont, consequently I could not couple the two together, but I did understand that in the Broadway Tunnel that the timbering would have to be placed at the expense of the contractor.

Q. And that under paragraph 20 of Section 32, which appears upon page 63 of the specifications, it was provided that "The prices bid per lineal foot for tunnel construction of the various sec- [942] tions and of cross adits shall constitute full compensation for all excavation; the removing, transporting and depositing of materials, as herein provided, timbering, drilling, blasting, draining, ventilation, timber and removal, structural steel supports and removal, and all concrete work as shown in the plans, including all concrete placed outside the neat lines of the concrete structure, and all grouting"; by that term "grouting" is meant concrete between the timbers and the material that fills the overbreak which is not filled by timber or lagging—"for all materials furnished and the transporting and placing of all materials." I do not think it is necessary to read further, because that deals with other portions of the work. Now, you had that in mind when you were preparing your estimates?

(Testimony of Lewis Michael Larson.)

A. I did.

Q. As well as the provisions of the timbering section? A. I did.

Q. And those provisions of the timbering section provided that where the District Engineer authorized you to do so, or with his consent, that the timber could be permitted to remain permanently?

A. I do not quite couple that. I thought you were making a statement rather than asking a question. I ask that it be read over again.

Q. Perhaps I had better restate it, your suggestion is probably good. You had in mind as well as the fact that the contractor had to furnish all the material as provided by paragraph 20 of Section 32, which appears on page 63, that also if it was impracticable to remove the timbers or for other reasons it was necessary to leave them in, they would be left in with the consent of the District Engineer? A. Yes.

Q. You knew that? A. I did.

Q. And then, knowing that, you considered because it stated that it was practicable, or it was the general intent to remove the [943] timbering, you coupled that with the other provision of the specifications and concluded that there was material in the tunnel which would be self-supporting in the majority of the area penetrated?

A. I did in this way, that it seemed to reflect the thought of the geology report.

(Testimony of Lewis Michael Larson.)

The Court: We will take a recess for a few minutes. [944]

(After Recess)

Mr. Tinning: Take the witness, gentlemen; no further cross-examination.

Redirect Examination

Mr. Marrin: Q. Mr. Larson, you testified you were employed on February 27th of 1934, and you then started estimating, and the bid was submitted on May 22, 1934. How much time, between those two dates, of your time was put in in making this estimate?

A. Very nearly two months; and a good portion of that time,—at least, the first three weeks,—were at least 16 hour days. I worked as long as I could until the requirement for rest forced me to bed.

Q. When you went to Fort Peck, did Mr. Orselli go with you? A. He did.

Q. Did Mr. Orselli make any changes in your estimate without first consulting you?

A. I am sure he did not.

Q. Did you do any work on the estimate after May 15, 1934?

A. It is possible that I did; but I did not enter anything into it; but I believe, as I recall it now, Mr. Marrin, I was advised, when persons and the quotations came in on material, as to what those quotations were; but I entered nothing, as I recall it now, myself, in that estimate after May 15th.

(Testimony of Lewis Michael Larson.)

Q. But you were in consultation with respect to it up to the time the bid went in?

A. Yes; but not so direct as I had been up to May 15th.

Q. On your cross-examination, you have testified as follows, as page 303 of the transcript:

"Q. You say, now, you think you were employed about the 15th of September. Weren't you employed immediately following the slide?

"A. I was employed by the legal department.

"Q. You were employed by the legal department? A. Yes. [945]

"Q. That is the legal department of the plaintiff Six Companies?

"A. As I understand it."

As a matter of fact, who communicated with you and employed you at that time, Mr. Larson?

A. Mr. Steve Bechtel called me and asked me to meet him in his office on August 28th; and, on August 29th, called me and asked me to meet him up at the tunnel; and, when I arrived at the tunnel then, Mr. Delancey Smith asked me to make observations in the tunnel and to attend a meeting that was then in progress, or about to be called, by Mr. Reardon. I made this error the other day, unintentionally; I had in mind a member of the present legal department.

Q. So, you were employed by Mr. Bechtel?

(Testimony of Lewis Michael Larson.)

A. I was employed by Mr. Bechtel.

Q. You testified, on your cross-examination, that you made an estimate of the amount of the bid which should be submitted for completing the project after the Six Companies of California stopped work. Do you recall the amount of that estimate which you made?

Mr. Wittschen: We object to that as immaterial and not proper redirect examination. The bid to complete the work would not tend to show what damage was sustained or any right to rescind the contract, and was made after they walked off the job.

Mr. Marrin: If the Court please, the defendants, themselves, opened the matter up on cross-examination. They proved that Mr. Larson, having made that estimate, it was turned over to the George Pollack Company, and they have used it as the basis for their bid. We did not open the matter up on direct examination, but they opened it up on cross-examination.

Mr. Wittschen: The fundamental rule, about offering a matter on cross-examination which is immaterial and which may test the witness, ends with the cross-examination. It does not permit, on [946] redirect, to go into it and spin out that immaterial matter.

The Court: For the purpose of the record, indicate what you are offering this for; upon what ground.

(Testimony of Lewis Michael Larson.)

Mr. Marrin: We desire to show that the amount of the bid of George Pollack Company was based on Mr. Larson's estimate, and was substantially the same amount.

Mr. Wittschen: The fact he made a bid for another contractor, thereafter, to complete the tunnel, after this contractor moved off, is wholly immaterial to this controversy, and is not proper redirect.

The Court: I cannot see the materiality of it.

Mr. Marrin: Well, it is only material, your Honor, as developing the facts in a matter which was brought about by the defendant's cross examination.

Mr. Smith: Also the accuracy and character of the estimating ability of the witness is drawn into this by the attempted cross-examination of the subject matter; and this would show, if proven, that the witness's estimate was accurate,—estimated it in good faith, for another contractor, at a later date; thereby, reestablishing the credibility of his former estimate.

Mr. Wittschen: I will ask the Court the question: Are we bound by what other contractors do?

Mr. Marrin: You opened the matter up.

Mr. Wittschen: We had a right to, on cross-examination.

The Court: The Court will sustain the objection.

Mr. Marrin: Exception.

(Testimony of Lewis Michael Larson.)

Mr. Alexander: We join in the exception, your Honor.

Mr. Marrin: Q. At page 319 of the transcript, you testified, with respect to the Bayshore Tunnel constructed for the Southern Pacific Company, as follows: [947]

"Q. Yes.

A. We had this earthquake, that we might have celebrated yesterday, during the period of that work; and after the earthquake, it seemed very heavy pressures came on the tunnel. It had been registered during the period when we were shut down; and immediately following the earthquake, the minute we began to work the ground, the timbers began to take terrific pressure, and we had to have the core to give support on that account; otherwise, it might have stood without support.

"Q. Well, there was a considerable period, then, after you got some of your excavating done, your timbers in, when you were delayed in construction due to the interruption of the earthquake, and pressure came on those timbers during that period?

"A. I think the result of the shake caused it, and may have been immediate but it did not register until we began to move the timbers.

"Q. How long was it after the earthquake before you resumed work in the tunnel?

"A. My recollection was about 10 days.

(Testimony of Lewis Michael Larson.)

"Q. It was not a very long period?

"A. No."

Was there any other delay to that work caused by the earthquake, than the 10-day period in which the work was shut down?

A. Yes; in this way: that retimbering and giving support to a structure like a tunnel, brings into the tunnel such a large group of men, and the necessity for transportation of materials like timber, brick and cement, that had to be rushed in to meet that emergency,—that automatically slowed down the driving of the drifts, though only to a limited extent; the drift driving was continuous, but handicapped, in a measure, by other operations.

Q. It did slow down the balance of the work?

A. For a distance, only; possibly for a period of three weeks, as I recall it now.

Q. You testified, Mr. Larson, on cross-examination, that the [948] timbering was removed from the Hollywood Tunnel. The Hollywood Tunnel is in Los Angeles, is it not? A. It is.

Q. And that the ground was not self-supporting in that tunnel? A. No; it was not.

Q. You have also testified that you contemplated the removal of the timbers when you made your estimate for constructing the Broadway Tunnel?

A. Yes.

Q. Was the method of removing the timbers, which you contemplated in making your estimate

(Testimony of Lewis Michael Larson.)

for the Broadway Tunnel, the same method that was used in connection with the construction of the Hollywood Tunnel?

A. There was a difference, in this way: that, in the Hollywood Tunnel, we excavated by the full drift system, and left the core in, which required our having wooden forms; in the Broadway Tunnel, it was contemplated to use steel forms; and, in the use of the core as a support to our wooden forms, it made it possible to carry a greater weight on our forms than would be practicable or feasible on steel forms; and in the cherts section and in the Orindan section, it was contemplated to leave the spiling in, to prevent falling of rocks, falling on the workmen below, not with a thought that it would be necessary to carry any of the support of the structure onto the concrete forms.

Q. If you had contemplated removing the timbers in the Broadway Tunnel, in the same manner that you removed them in the Hollywood Tunnel, would it have increased your estimate of cost?

A. Very materially, in that section, or any section that was not self-supporting.

Q. Could you state how much it would have increased your estimate of cost?

A. That would be largely a rough guess, Mr. Marrin; but I would say, in view of the information I have, that it would have cost at least a million dollars more, and probably extended [949] the time period many months. I would have to really estimate

(Testimony of Lewis Michael Larson.)

that to give an answer that is anywhere near definite.

Q. You testified, in connection with the Figueroa Street Tunnels, that the steel supports were left in. Do you know, now, whether that was a requirement of the contract or not they be left in?

A. Let me get this clearly. Do you mean the steel supports that carried the lagging and the forms?

Q. Well, the steel supports concerning which you—— You testified that the steel supports were left in?

A. Yes; those were pipes loaded with concrete that we carried down to the forms. There was no requirement that they be removed or left in. The Pacific Electric people permitted us to use our own judgment and did not disapprove of the method.

Q. You also testified, in connection with the Yerba Buena Tunnel, that there were certain steel beams crossing over, from, I believe, about the spring line of the arch, which were left in. Were those a part of the design of that tunnel?

A. Yes.

Q. And they were required to be placed?

A. Required to be placed.

Q. Regardless of the type of the ground?

A. Yes.

Q. Did that tunnel have a wide arch?

A. A very wide and a very flat arch; that is, I say "very"—I mean, by that, in a comparable sec-

(Testimony of Lewis Michael Larson.)

tion. I have been thinking, since I stated "58,"—that being the width of the tunnel,—I may have been very much short of that; it may have been 78 feet.

Q. Would that make the support more difficult?

A. Yes. As your span increases, your difficulties increase, unless your ground is of a structure where it is entirely safe and self-supporting.

Q. Referring to Defendant's Exhibit "B," on your cross-examination you were asked a number of questions concerning your knowledge of the various tunnels which are shown thereon, and your knowledge of [950] the ground conditions of those tunnels. Would the character of the ground, in those tunnels other than the Broadway Tunnel, enable you to determine what character of ground it would be in the Broadway Tunnel?

A. I can see very little relationship between them, because, even in one tunnel, ground changes sometimes from side to side, or a few feet in advance it might be different than a few feet back. The only thought that would be useful in the use of other tunnels would be if you did not have a definite statement from a geologist that this particular tunnel, like the Broadway Tunnel, probably was of a positive character; that eliminates any other tunnel from the discussion.

Q. For instance, where you have a tunnel such as No. 2 shown on this exhibit, which is several miles from the Broadway Tunnel, I take it the fact

(Testimony of Lewis Michael Larson.)

the ground is of certain character in Tunnel No. 2 would not indicate the character of the ground in the Broadway Tunnel?

A. No. I don't see the relationship there. Coming back to your statement there: it is my belief that lava may not have been encountered in the tunnel that you mention; it was encountered in the Claremont, and was not expected; and was not encountered, I believe, in the Broadway Tunnel. You see, you have three tunnels there, where possibly the conditions were different. I know it was different in the Broadway Tunnel than the Claremont Tunnel, from the information that I have; and I know of a lava having been encountered in the Railway Tunnel that lies to the south.

Q. The formations encountered in the Claremont Tunnel,—which is the closest tunnel to the Broadway Tunnel,—were, to a great extent, considerably different than those in the Broadway Tunnel, were they not?

A. There were only two comparable materials: those were the cherts and the Orindan. I know of no Monterey [951] sandstone in the Claremont Tunnel. I know that there was not any, anticipated by the geological report, of Chico sandstones, or lava, in the Broadway Tunnel. Therefore, there could be no comparison. The only comparable ones would be the cherts and the Orindan.

Q. Were you in charge of all of the work of excavating in the Claremont Tunnel?

(Testimony of Lewis Michael Larson.)

A. No; I was not. I had charge of, as I recall it, now, about 12,400 or 12,600 feet from the west end in the excavation and the lining of that portion of the tunnel. The eastern 5,000 or possibly 6,000 feet, —I don't recall the distance now,—was done by another superintendent or other superintendents. Later on, I came into that portion of the tunnel to do some additional work that was required.

Q. Calling your attention to the accident which happened on Thanksgiving Day, when the water rushed into the Claremont Tunnel: at which end of the Claremont Tunnel did that water enter?

A. That came in from the east end, from the Orindan creep.

Q. Did you have charge of that portion of the work at the time?

A. No; I did not. In fact, the place where the water came in was under the control of another contractor.

Mr. Wittschen: Mr. Marrin, that was not intended to reflect upon Mr. Larson.

Mr. Marrin: Well, the testimony was brought in, in such a way——

Mr. Tinning: The purpose of that was related to the hazards and so on; that was not any reflection on Mr. Larson.

Mr. Wittschen: In fact, it came in through the Lafayette Tunnel and went on through,—with which he had nothing to do.

(Testimony of Lewis Michael Larson.)

Mr. Marrin: Q. Mr. Larson, referring to Plaintiff's Exhibit 22,—which is the geological map prepared by Professor Louderback,—you have testified that the only part of this report which was before [952] you, at the time you made your bid, was pages 13 to 19, inclusive. Since that time, have you read the balance of the geological report which covers pages 1 to 12, inclusive? A. I have.

Q. Do pages 1 to 12, inclusive, deal with the tunnel?

A. Not to my recollection. I think that deals with the approach work.

Q. It deals with the outside highway geology?

A. Yes; also the last page,—page 19 of that report,—as I recall it, deals with the outside work, at the east end.

Mr. Wittschen: There is no contention made otherwise, except in the first paragraph.

Mr. Marrin: With the exception of possibly the first paragraph?

Mr. Tinning: That was all that was referred to; and the only purpose of that was to establish the fact certain diagrams were referred to in that paragraph.

Mr. Marrin: I just want to make it clear that this part he did not have before him did not refer to the tunnel geology.

Mr. Tinning: But it referred to the diagram. Page 1 referred to the other diagrams that were

(Testimony of Lewis Michael Larson.)

attached to the report which he did not see. That was the purpose of introducing that matter.

Mr. Marrin: Q. Mr. Larson, referring, further, to Plaintiff's Exhibit 22, on your cross-examination you testified that you did not see, prior to bidding, the blueprint which is attached to that exhibit and which is marked "Plan and Profile of Tunnel Approved by George A. Posey, dated May, 1932"; but that you did have before you a tracing from the profile which is dated July 7, 1930; drawing your attention to the westerly portion of the blueprint and the profile, and to the point marked on there "Stream Terrace," on the profile, and to the point marked "Overburden, Stream Deposit and Hill Wash in Creep," on the blueprint, will you state how much further [953] in feet the overburden or stream deposit and hill wash and creep is shown on the blueprint as extending easterly into the hill on the blueprint than it is on the profile?

A. Approximately 110 feet further.

Q. 110 feet further, on the blueprint, than it is on the profile?

Mr. Tinning: Does that refer to the top or bottom?

Mr. Marrin: Where it intersects the tunnel line.

Mr. Wittschen: Turn over that blueprint. You mean the top or bottom,—referring to this point or to some immediate point?

Mr. Marrin: Well, he states the point, where it apparently intersects the top of the tunnel, lies——

(Testimony of Lewis Michael Larson.)

The Court: Well, I think he said about 110 feet. Where is the 110 feet?

Mr. Marrin: I am trying to get that clearly, your Honor.

The Witness: A. The point on which I am speaking is the intersection of the indicated top of the tunnel with the stream terrace; that is at this point here, as against——

Mr. Tinning: Q. That is the diagram, July 7, 1930?

A. Yes—That would be about Station 111 plus pretty close to 70 or 75. 75 is close enough for an approximation.

Mr. Marrin: Q. In other words, where the stream wash is shown on the profile of July 7, 1930, as intersecting the top of the tunnel, is at Station, approximately, 111 plus 70?

The Court: Indicate that on there.

The Witness: A. 111 plus—it would be plus 75—plus 70; that would be about—just about where I have my pencil.

Mr. Marrin: Q. On the blueprint, which is dated——

Mr. Tinning: May, 1932.

Mr. Marrin: —May, 1932, the stream wash is shown as intersecting the top of the tunnel, at approximately Station 112 plus 90? [954]

A. Possibly about 85; plus 85.

Q. 111——

A. It would be a difference of about 110 feet.

(Testimony of Lewis Michael Larson.)

Mr. Wittschen: Q. The intersection of the top of the tunnel; but not how far the material may extend further east?

A. No. I just had in mind the number. [955]

Q. If you had had that blueprint before you would it have made any difference in your estimate?

Mr. Wittschen: Objected to as not proper redirect examination, and immaterial, irrelevant, and incompetent, the fact that he did not have it. He is asking him now——

Mr. Marrin: He is entitled to express an opinion.

Mr. Wittschen: Wait a minute until I finish. He is asking him now to state what his opinion would have been on something that he did not see some three or four years ago.

The Court: Is it conceded that there was an absence of the blueprint?

Mr. Wittschen: He did not see it.

The Court: What is that in answer to? I am trying to get the reason for this.

Mr. Marrin: On cross-examination they emphasized the fact that Mr. Larson did not see the blueprint and there appears to be some slight difference between the location of the hill wash on that and upon the profile which he did see, and I am asking him whether if he had seen the blueprint it would have made any difference in the amount of his estimate for the construction work?

(Testimony of Lewis Michael Larson.)

Mr. Wittschen: That is not quite the whole story.

The Court: What is the legal application of it in reference to his failure to see the blueprint? I am trying to reach the problem.

Mr. Marrin: I am trying to show whether the fact that he did not see the blueprint would have made any difference to him in making the estimate. I am asking him that question.

The Court: I will allow it if there is any point in it. What is it in answer to, what is the merit of it? What is the legal phase of this matter that we are discussing? [956]

Mr. Wittschen: We could not possibly be charged with his failure to look at the blueprint.

The Court: That is what I am trying to analyze in my own mind.

Mr. Marrin: I am not trying to charge them with it, but he did see the profile, which is substantially the same as the blueprint.

The Court: I will allow it if there is any point.

Mr. Wittschen: Note an exception.

A. There would have been substantially no change in the estimate.

Mr. Marrin: Q. Now, Mr. Larson, I am referring to page 438 of the transcript, where the following appears. I am reading from the transcript:

"Mr. Tinning: Q. In other words, your conclusion from an inspection of the site was

(Testimony of Lewis Michael Larson.)

borne out by what you found when you excavated?

A. Well, I will have to go back to a statement that I made earlier, we found nothing in my examination of the ground which seemed to conflict with the conclusions that Dr. Louderback drew in his report.

"Q. That is not an answer to my question, Mr. Larson. I asked you if you found when you excavated anything different from your conclusions drawn from your observation of the site. I am not asking about the report.

A. Very little difference, only one of degree, probably I should say this, I found a mud that I did not expect to find in the south tunnel."

To what portion of the tunnel did your answer to that question relate?

A. To the first forty feet.

Q. Was it confined to the first forty feet of the tunnel?

A. That was the purpose of my answer, to confine it to that.

Q. Mr. Larson, I am now referring to Defendant's Exhibit F, which is a letter from C. H. Fry to T. M. Price, which reads as follows——

The Court: Identify it. [957]

Mr. Marrin: It is Defendant's Exhibit F.

The Court: I know, but the parties, who were they?

(Testimony of Lewis Michael Larson.)

Mr. Marrin: It is a letter from C. H. Fry, Superintendent of Safety of the Industrial Accident Commission, to T. M. Price.

The Court: Oh, yes.

Mr. Marrin: "Mr. T. M. Price, Six Companies of California, P. O. Box 120, Berkeley, California.

"Dear Mr. Price:

"On April 15, 1935, F. L. Lowell, our Supervising Mining Engineer, before leaving for a trip to Mariposa County, called my attention to the conditions in your two lower Broadway Tunnels. I am enclosing a copy of his memorandum.

"You realize that it is the duty of the employer to take whatever steps are necessary to make its place of employment safe, and it is not the duty of the Industrial Accident Commission to do that.

"For some time before the Six Companies bid on this project, we conferred with Mr. Larson and Mr. Fontaine and called to their attention the type of formation through which this tunnel was to be driven, and that the ground would be particularly bad, and that we were quite sure methane gas would be encountered. As we all know, the ground has been particularly bad from the start of the work.

"Although I have not visited this project for some time, the information which I have re-

(Testimony of Lewis Michael Larson.)

ceived from various sources, makes me doubt the advisability of the type of excavating which is being done in the down-grade or north tunnel.

"This matter should be given your serious consideration, and every means known should be taken to prevent this ground from caving or running up in any way, causing conditions which would intro- [958] duce the possibility of personal injury."

Now, directing your attention specifically to this statement, "For some time before the Six Companies bid on this project, we conferred with Mr. Larson and Mr. Fontaine and called to their attention the type of formation through which this tunnel was to be driven, and that the ground would be particularly bad," I will ask you did Mr. Fry ever make the statement to you that the ground, that is, did he make a statement to you prior to the bid that the ground through which the tunnels would be driven would be particularly bad?

A. He did not. We did not approach Mr. Fry with a view to getting his opinion on that ground, realizing that he was incompetent. What we were after was to find out what the rules were that would be enforced regarding safety, on account of gas formations, and we went into that very thoroughly, and he elaborated very considerably on what might happen. But I have no recollection, and I am very

(Testimony of Lewis Michael Larson.)

positive that we did not discuss the ground conditions. He was not competent; we would not go to a person that we considered incompetent and discuss those things, in view of the fact that we had a very competent geological report waiting for our inspection.

Q. What you discussed with Mr. Fry then was the gas condition and not the ground condition?

A. Entirely, as far as I know, as far as I can remember.

Q. Mr. Larson, you were asked just before the recess about certain conversations had with Mr. Boggs and I believe it was in August or September, 1936. Was Mr. Kempkey present at those conversations?

A. Not while I was talking with Mr. Boggs.

Q. You do not recall him being present at all?

A. Mr. Boggs later on took me into Mr. Kempkey's office and introduced me to Mr. Kempkey.

Q. Was anyone other than Mr. Boggs present while you were talking [959] to Mr. Boggs?

A. I have no remembrance of anyone else being present.

Mr. Marrin: If your Honor please, there have been introduced here on cross-examination a number of specifications which we will not have the opportunity to examine until over the week-end. It is possible we may want to recall this witness for some questions on redirect examination after we examine those specifications.

(Testimony of Lewis Michael Larson.)

The Court: Very well.

Mr. Marrin: That is all.

Recross Examination

Mr. Tinning: Q. Mr. Larson, do you know of any tunnel through which a full faced driving operation has been used in the San Francisco Bay Region? A. No, I do not.

Q. There has not been one built that way?

A. I would not say there has not been, but I do not know of any.

Q. You do not know of any? A. No.

Q. Do you know of any tunnel in Los Angeles where there has been a full faced driving operation?

A. I know one that was attempted.

Q. And failed? A. And failed.

Q. That was the one where you said fear by psychology entered into it?

A. I do not know whether I expressed myself in regard to that particular tunnel, but this tunnel, a very wide one, the width of a street——

Q. What tunnel was that?

A. That was the Second Street Tunnel, which was driven by Mr. Hill.

Q. And it failed?

A. Well, he failed to continue.

Q. Driving full-faced?

A. Driving full faced.

Q. So the tunnel was not driven full-faced?

A. No.

(Testimony of Lewis Michael Larson.)

Q. In the Second Street Tunnel they started to drive it full-face [960] and they failed?

A. That is my understanding.

Q. That is what you said? A. Yes.

Q. So that you know of no tunnel in the Coast Range Mountains that was driven by a full-faced operation?

A. Let me get this straight. You are referring to the immediate vicinity, say from Stockton this way?

Q. In the Coast Range; I am not going into the granite of the Sierras. We are talking about the Coast Range.

A. There is none that I know of.

Mr. Tinning: That is all.

Mr. Marrin: No further questions.

The Court: We will take a recess now until two o'clock.

(A recess was here taken until two o'clock p. m.) [961]

Afternoon Session
2:00 o'clock.

Mr. Marrin: I overlooked a fact before luncheon, that there is a little confusion in identifying a couple of photographs that went in yesterday, and I would like to recall Mr. Larson.

L. M. LARSON,

Recalled.

Mr. Marrin: Q. Mr. Larson, I call your attention to Defendant's Exhibit L. You stated yesterday that that was poured by the use of buggies. Do you wish to change your testimony in that respect?

A. Since then I have observed that the designation refers to the fact this was the north tunnel instead of the south tunnel, as I believe I was asked, I believe the transcript states that it was the south one, in which event I would change the testimony and say that it was poured by the Hackley gun instead of buggies.

Q. I draw your attention to Exhibit M, which you stated was poured with the Hackley gun. Do you want to change your testimony in any respect?

A. I do. This was poured by the buggy method.

STEPHEN DAVIDSON BECHTEL,

called for the Plaintiff. Sworn.

Mr. Marrin: Q. Where do you live, Mr. Bechtel?

A. 244 Lakeside Drive, Oakland, California.

Q. What is your present business?

A. Contractor.

Q. Did you employ Mr. L. M. Larson in February, 1934? A. I did.

Q. For whom did you employ him?

(Testimony of Stephen Davidson Bechtel.)

A. W. A. Bechtel Company and Henry J. Kaiser Company.

Q. For anyone else?

A. And four associates with whom we planned or had talked of considering the Broadway Tunnel project.

Q. Who were those associates?

A. The Utah Construction Company, [962] McDonald & Kahn Co., Ltd., Morrison Knudsen Company and J. F. Shea Company.

Q. For what purpose did you employ Mr. Larson?

A. To investigate the job and prepare an estimate for the tunnel portion of same.

Q. What job are you referring to?

A. The Broadway Low Level Tunnel Project.

Q. For the defendant Joint Highway District No. 13? A. Yes.

Q. What instructions did you give Mr. Larson?

A. To thoroughly investigate the job, plan the method of construction, and make an estimate for the construction of the tunnel portion of the job.

Q. What was done thereafter in preparing an estimate and bid for the project?

A. Mr. Larson came to our San Francisco office, proceeded to investigate, study, plan and estimate the job. I assigned A. L. Orselli to assist him as an assistant clerk, engineer estimator, and Larson proceeded with the investigation, planning and estimating of the job.

(Testimony of Stephen Davidson Bechtel.)

Q. Did Mr. Larson submit an estimate of the job and cost of doing the tunnel portion of the job to you?

A. He submitted it to me through Al. Orselli and with Al. Orselli.

Q. What was thereafter done with that estimate?

A. Upon receipt of the details of this estimate I called a conference, which was attended by Larson, Orselli, Joseph Shaw, and Fontaine. We went over the details of the estimate very carefully, reviewed the method, the assumptions, the figures, and the summaries of the entire estimate.

Q. What was done then?

A. In the course of our conference I instructed Shaw to make extensions on the Larson estimate which we had at that time, and we discussed all phases of it, and at the completion of the conference I instructed Shaw, with Orselli's assistance, to summarize them and return the same to me at a future [963] date when they would be needed for compilation with other estimates on other portions of the project.

Q. Was that done? A. That was done.

Q. Then what did you do?

A. I used that summary, that is, the Larson tunnel estimates, with the estimates for the other portions of the project, as a basis for the bid. That was discussed with the directors of the Six Companies

(Testimony of Stephen Davidson Bechtel.)

of California, and was used as a basis of the bid which was subsequently submitted.

Q. Can you state when the Six Companies of California was organized? A. May 15, 1934.

Q. Did you become an officer of the corporation? A. I did.

Q. What officer? A. Its President.

Q. How long thereafter did you remain president of the Six Companies?

A. I believe it was until February 29, 1936.

Q. Did you sign the bid which was submitted by the plaintiff to the defendant in this case?

A. I did.

Q. Did you submit that bid to the defendant?

A. You mean to the Joint Highway District?

Q. To Joint Highway District No. 13.

A. I did.

Q. Upon what were the costs which went to make up the part of the contract dealing with the tunnel which were included with that bid based?

Mr. Wittschen: Objected to as immaterial, irrelevant, and incompetent, and calling for a conclusion and opinion of the witness, and also on the ground that the bid speaks for itself. It is not upon what the costs were based, but the bid by which the defendant would be bound.

Mr. Marrin: If your Honor please, we are again offering this evidence for the purpose of connecting up the estimate of Mr. Larson with the bid which was submitted, showing that it was [964] the basis of the bid of this plaintiff, and we offer to prove

(Testimony of Stephen Davidson Bechtel.)

through this witness that that estimate made by Mr. Larson was the basis of the plaintiff's bid so far as the tunnel portion of the project was concerned.

Mr. Wittschen: I submit that has already been asked and answered without objection, namely, that Mr. Larson gave figures to the Bechtel Company interests, and Mr. Bechtel has said that he used those in preparing the bid.

Mr. Marrin: At the time we offered that evidence Mr. Wittschen suggested that this would be the time to offer it.

Mr. Wittschen: I said that I would object to it, but you would get the ultimate fact by asking him if he did rely upon the Larson estimate. That you have already done and I did not object to it.

Mr. Marrin: That is what I am asking him now.

The Court: State the question.

Mr. Marrin: Q. In making up the bid for the Six Companies of California to be submitted to Joint Highway District No. 13 for the contract which is in evidence in this case, did you rely upon the estimate prepared by L. M. Larson for that portion of the project relating to the tunnel?

Mr. Wittschen: Objected to as immaterial, irrelevant, and incompetent, and not binding upon the defendant.

The Court: You may answer.

Mr. Wittschen: Exception.

The Court: You may answer. A. Yes.

(Testimony of Stephen Davidson Bechtel.)

Mr. Marrin: Q. Mr. Bechtel, how many feet of timber were included in the estimate upon which the bid of plaintiff was based?

Mr. Wittschen: Objected to as immaterial, irrelevant, and incompetent, and calling for a conclusion, and not binding on the defendant. [965]

Mr. Marrin: It is not a conclusion.

The Court: What do the plans and specifications say about the timber?

Mr. Wittschen: The plans and specifications say that all timber necessary will be supplied by the contractor.

Mr. Marrin: And shall be removed unless the District Engineer permits it to remain in.

Mr. Wittschen: No, if impracticable to remove it may be kept in, or, stating it in another way, they shall be taken out unless the District permits them in.

Mr. Marrin: That question does not call for any kind of a conclusion.

The Court: I know, but the testimony is going in and we must keep in mind the proposition, suppose it is a million or half a million, then what would be the difference?

Mr. Wittschen: It would make no difference, whatever necessary shall go in.

Mr. Marrin: We propose to show by this that the amount of timber actually required in constructing this tunnel was about six or seven times the amount plaintiff estimated.

(Testimony of Stephen Davidson Bechtel.)

Mr. Wittschen: That would be his misfortune, if that's the fact, but it would not be binding upon the defendant, which did not estimate it.

Mr. Marrin: That is your conclusion, and we think we have a right to prove the fact, and we offer this testimony for that purpose.

The Court: I will give you a record, but I do not want to mislead you to your injury. You may answer.

Mr. Wittschen: We note an exception.

A. Might I ask, do you mean the board feet of timber, or linear [966] feet in the tunnel?

Mr. Marrin: No, I mean board feet of timber.

A. Between 1,800,000 and 1,900,000 board feet.

Q. Did the bid on the tunnel section of the project include an estimated profit in addition to the estimated cost? A. It did.

Mr. Wittschen: Objected to on the ground it is immaterial, irrelevant, and incompetent, and ask that the answer go out pending the objection.

The Court: It may go out.

Mr Wittschen: And not in any wise binding on the defendant.

The Court: You may answer.

Mr. Wittschen: Exception.

A. It did. [967]

Mr. Marrin: Q. Mr. Bechtel, did you have any discussion with Mr. Boggs, during the course of the construction work under this contract, regarding an extension of time? A. Yes.

(Testimony of Stephen Davidson Bechtel.)

Q. State when you had the first discussion with Mr. Boggs, who was present, and what was said.

A. In April or May, 1934——

Mr. Wittschen: Did you ask him for a conversation? If you did, I would like to make an objection.

Mr. Marrin: Yes.

Mr. Wittschen: May I interpose the objection now? We object on the ground it is incompetent, irrelevant and immaterial, calling for testimony which is not binding upon the defendant. If your Honor cares to have that argued, I am prepared to argue it. You permitted it, in connection with the other witness, on the ground it might come in subject to a motion to strike. The contract between the parties cannot be varied in any way by what the Engineer of the District did. The Kelly case that we have cited in the brief shows that. If the purpose of this questioning is merely to show they asked for an extension of time, which was denied, I will object to that on the ground that that was not one of the things which was within the province of the District Engineer; everything else connected with the construction was, but, on the matter of extensions of time, the contract provided they must apply for that to the Board of Directors of the District. We have no objection to their written applications for extensions of time going into evidence. They asked for time, and there were letters back from the District denying it; but conversations with the District Engineer, who had nothing to do with that matter, we

(Testimony of Stephen Davidson Bechtel.)

claim are wholly immaterial. We are not trying to exclude the fact they asked for time, and that that time was denied; that is a matter of written record, which we are willing to admit. [968]

Mr. Marrin: If the Court please, the specifications, in Section 4, page 3, which is a part of that contract, after stating the time for the doing of the work, states, under the heading, "Extension:"

> "The time during which the Contractor is delayed in said work by Acts of God, or by stormy or inclement weather, or by any reason which, in the judgment of the District Engineer, unavoidably delays the work, shall be added to the aforesaid time for completion, provided that the Board of Directors approve in advance the written application therefor, which must be made by the Contractor for such an extension, before the expiration of the time limit fixed herein, or a duly granted extension thereof."

Now, if the Court please, this contract states, as I have stated, that, when cause which in the judgment of the District Engineer unavoidably detains the work, he shall give the Contractor the right to extend the time. It is our position in this case that——

The Court: Pardon me. Following that language, it provides a method by which——

case that that judgment of the District Engineer

Mr. Marrin: Surely; but it is our position in this

(Testimony of Stephen Davidson Bechtel.)

must be exercised in a fair and unbiased manner for each party. He is not acting alone for the District. He is acting for the Contractor as well as the District. If, in his judgment, the Contractor has been unavoidably delayed, the Contractor is entitled, as of right, to an extension of time. Upon that ground, your Honor, we submit that we are entitled to show the action of the District Engineer. We are entitled to show, by any conversation with him, what he thought about whether or not the Contractor was or was not delayed. If we can show that, in his judgment, the Contractor was unavoidably delayed, and can show by the [969] conversations with him that he failed to certify that to the Board of Directors, then the action, in denying the extension of time, was wrongful. We are offering that evidence for this purpose; and we feel certain that, under the authorities, we have a right to prove it. The acts of engineers and architects, under clauses such as this, cannot be arbitrary or capricious; and, if the acts are, you have a right to set it aside or to show, by the arbitrariness or capriciousness of the action—we offer this testimony for the purpose of proving that; and we feel, under the cases, that we have a right to attack the position on that.

Mr. Wittschen: I want to point out, in the first place, there is not a word in the pleadings that any action of the Engineer was arbitrary. They had a right, upon the contract being breached by the District,—if you will assume it was breached,—to bring

(Testimony of Stephen Davidson Bechtel.)

an action in the form of a common count; but they have no right to claim a prerequisite to recover such as the certificate of the engineer, if that was a prerequisite, was given him, because of some fact, without pleading the fact to show why it was not given. All presumptions are in favor of the Engineer. But that is not the point of this objection. The point of my objection here goes further than that; and that is, the Board of Directors alone have the right to determine whether or not the time shall be extended; and I have no objection, as I stated, to showing a request for time was made and was refused; but I do object to the so-called hearsay evidence, statements of the Engineer, upon a matter which was supposed to be acted upon by the Board.

Mr. Marrin: Well, under this contract, if, in the judgment of the District Engineer, the Contractor is unavoidably delayed, the Board of Directors has no discretion; it must grant the extension of time. In order to show his judgment on the matter, it is necessary [970] for us to show, so far as we can, the state of mind; and his conversations on that subject are certainly pertinent and relevant.

Mr. Wittschen: His advice to the Board of Directors might be, if you want to call him for that; but certainly not conversations he had with the Contractor.

Mr. Marrin: We think we will prove, if your Honor please, before this case closes, that the Engineer was so under control of the Board of Directors

(Testimony of Stephen Davidson Bechtel.)

that he probably did not report to them the real judgment that he had in connection with the matter.

The Court: Well, as a legal proposition, let us assume that the Engineer acted arbitrarily and, in the absence of any written record——

Mr. Marrin: Your Honor, we will follow this with written records.

The Court: On the very subject matter you are covering now?

Mr. Marrin: Yes.

Mr. Wittschen: We have no objection to the writings.

The Court: I will give you a record on it. Proceed.

Mr. Wittschen: Exception.

Mr. Marrin: Q. Do you wish the question read, Mr. Bechtel? A. Yes.

(Pending question was read by the reporter.)

The Witness: A. In April or May, 1934, Wallace Boggs, T. M. Price——

Mr. Marrin: Q. Pardon me, Mr. Bechtel. 1935, you mean, don't you? You said 1934. That was before the term of the contract.

A. 1935—April or May, 1935.

The Court: Q. Where did it take place?

A. In front of the Six Companies' job office,—the steps of our office.

Q. Is that the nearest you can fix the time?

A. Yes. Tom Price, [971] Wallace Boggs and I met to discuss the job. I told Mr. Boggs of the diffi-

(Testimony of Stephen Davidson Bechtel.)

culties we had encountered,—the unusually bad weather conditions, the difficulties we were having in procuring adequate supplies of competent men under the restrictions of the contract, and the ground conditions, which were very different than those we had contemplated. I told him the conditions were beyond our control, and they entitled us to an extension of time; but that, before applying for the extension of time, I desired to discuss it with him, so he would be familiar with our application. He said he knew of these conditions, and that they entitled us to an extension of time; but that he did not favor our making application for extension of time, because it was not known as to what period of time would be required to complete the job. About this time in our conversation, Tom Price left. Boggs and I continued our frank discussion; and he told me, in substance, that he could not give us an extension of time without the approval of the Board of Directors and without the approval of the District's attorney,—Mr. Tinning.

Mr. Marrin: Q. And that was all the conversation? A. In substance, yes.

Mr. Marrin: I have here a copy of letter of June 10, 1935, Mr. Tinning. I assume you have the original. Will it be stipulated that this is a true copy of a letter dated June 10, 1935, addressed by Six Companies of California, by S. D. Bechtel, President, to the Board of Directors, Joint High-

(Testimony of Stephen Davidson Bechtel.)

way District No. 13 of the State of California, 1448 Webster Street, Oakland, California.

Mr. Wittschen: With the same understanding we had, subject to checking?

Mr. Marrin: Surely.

Mr. Tinning: So stipulated.

Mr. Marrin: That was sent by Six Companies of California, and [972] received by the defendant?

Mr. Tinning: Yes.

Mr. Marrin: I offer that in evidence.

(The letter was marked "Plaintiff's Exhibit No. 45.")

Mr. Marrin: I would like to read the letter, if your Honor please. It is dated June 10, 1935, and reads as follows:

PLAINTIFF'S EXHIBIT No. 45

June 10th, 1935

The Board of Directors,
Joint Highway District No. 13
of the State of California,
1448 Webster Street,
Oakland, California.

Dear Sirs:

Pursuant to the provisions of subsection C of Section 4 of the Specifications for the construction of the Broadway Low Level Tunnel, said section 4 having to do with the subject of time, we hereby make written application for an ex-

(Testimony of Stephen Davidson Bechtel.)

tension of the time for completion of the work covered by the contract in the amount of one hundred eighty days (180).

Said demand is based upon the provisions of said subsection C of Section 4, and upon the grounds that the work has been delayed by Acts of God, stormy and inclement weather, and other reasons beyond our control which will have unavoidably delayed the work.

The other reasons above mentioned may be made the subject of a detailed statement thereof by us at a later date.

Very truly yours,

SIX COMPANIES OF CALIFORNIA

By S. D. BECHTEL,

President.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Plff's Ex. No. 45. Filed April 22, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

Mr. Marrin: Q. After sending this letter, Mr. Bechtel, did you again discuss the subject of time extension with Mr. Boggs?

A. A few days later, I met Boggs on the job, and he said, in substance, that our application had been embarrassing——

Mr. Wittschen: Pardon me. I want to object to

(Testimony of Stephen Davidson Bechtel.)

the conversation. Your question did not call for a conversation, did it?

Mr. Marrin: Yes.

Q. Did you have a conversation with Mr. Boggs?

A. Yes. [973]

Q. State when that conversation was held, who was present, and what was said.

Mr. Wittschen: We object to that as incompetent, irrelevant and immaterial, and upon all the grounds previously stated.

The Court: Overruled.

Mr. Wittschen: Exception.

The Witness: A. Shortly after we submitted our formal application for extension of time, I met Wallace Boggs on the job, in company with my brother Kenneth. Boggs said that our application for extension of time had been embarrassing; he was quite disturbed over the matter.

Mr. Marrin: I have here, Mr. Tinning, the original of a letter signed by Joint Highway District No. 13 of the State of California, by Harry M. Stow, Secretary, dated July 12, 1935, addressed to Six Companies of California. Will it be stipulated that that was sent by the District and received by the plaintiff about the date it bears?

Mr. Tinning: Yes.

Mr. Marrin: And may we stipulate that we may substitute a copy for the original?

Mr. Tinning: Yes.

Mr. Marrin: I offer that in evidence.

(Testimony of Stephen Davidson Bechtel.)

(The letter was marked "Plaintiff's Exhibit No. 46.")

Mr. Marrin: I should like to read the letter. This is a letter on the letterhead of Joint Highway District No. 13 of the State of California; it is dated July 12, 1935, and reads:

PLAINTIFF'S EXHIBIT No. 46

Joint Highway District No. 13
of the
State of California

Oakland, California
July 12, 1935

Six Companies of California,
155 Sansome Street,
San Francisco, California
Attention Mr. S. D. Bechtel, President

Gentlemen:

I am authorized by the Board of Directors of Joint Highway District No. 13 to advise you that your application dated June 10, 1935, for a 180 day extension of time of completion of the work to be performed by you under your contract with the District dated June 4, 1934, has been denied.

The Board of Directors is of the opinion that no delay in the prosecution of the work under the contract has been occasioned by acts of

(Testimony of Stephen Davidson Bechtel.)

God, stormy or inclement weather, or any other reason beyond your control as contractor.

Yours very truly,

JOINT HIGHWAY DISTRICT No. 13 OF THE STATE OF CALIFORNIA

By (Signed) HARRY M. STOW,

Secretary.

HMS:EK

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Plff's Ex. No. 46. Filed April 22, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk. [974]

Mr. Marrin: Mr. Tinning, I have here a copy of a letter dated July 26, 1935, signed by Six Companies of California, by S. D. Bechtel, President, addressed to the Board of Directors of Joint Highway District No. 13, State of California. Will it be stipulated that that is a true copy, subject to your check, of a letter which was sent by Six Companies of California to the defendant Joint Highway District No. 13, about the date thereof?

Mr. Tinning: Yes.

Mr. Marrin: I offer that in evidence.

(The letter was marked "Plaintiff's Exhibit No. 47.")

Mr. Marrin: I should like to read that letter. The letter is dated July 26, 1935, addressed to Board of Directors, Joint Highway District No. 13 of the

(Testimony of Stephen Davidson Bechtel.)

State of California, 1448 Webster Street, Oakland, California. It reads: [975]

PLAINTIFF'S EXHIBIT No. 47

July 26th, 1935

Board of Directors,
Joint Highway District No. 13
of the State of California,
1448 Webster Street,
Oakland, California

Dear Sirs:

Under date of June 10th, 1935, we addressed you a letter requesting extension of time for completion of the work included in our contract with your District for the construction of the Broadway Low Level Tunnel, all in accordance with the provisions of the specifications covering the subject of "Time". Under date of July 12th, 1935, you replied to advise that our application requesting this extension of time had been denied by your Board, and stating it to be the opinion of the Board that "no delay in the prosecution of the work under the contract has been occasioned by Acts of God, stormy or inclement weather, or any other reason beyond your control as contractor."

Inasmuch as this reply amounts to a statement that your Board has determined that no ground for a claim for extension of time exists in our favor, we must make answer to same.

(Testimony of Stephen Davidson Bechtel.)

This is written to advise you that the above quoted portion of your letter of June 4th is an incorrect statement, and is not in accordance with what has been stated to us by your Chief Engineer and others connected with the District.

The delay which has already occurred has been caused by the heavy rain fall of the last rainy season, which was much greater than in any season in recent years, and by the fact that the condition of the ground was such that faster progress was impossible. The actual ground conditions have been far worse for working purposes than the condition of the ground shown by the geological report made by the geologist for the District; and this has resulted in retarding the speed of the work.

Within the past three months Mr. Boggs, your chief engineer, has advised the writer of this letter that the delay in the progress of the work was beyond the control of the contractor and was in no manner our fault, and has stated we have a proper ground to request an extension of time, but that he would not approve such an application at this time because it might later develop that the extension of time would be unnecessary. He has made substantially the same statement to Mr. T. M. Price within the last sixty days and has likewise made substanially similar statements to Mr.

(Testimony of Stephen Davidson Bechtel.)

DeLancey Smith. Under the circumstances, the grounds assigned in your letter of June 4th for denying the application are not in accord with the facts or with the opinion of your engineer, and therefore should be withdrawn, even though action on the application for an extension is deferred at this time.

We, therefore, write this letter to protest against the denial of the extension for the reasons given in your letter, and to reaffirm the application made by our letter of June 10th and our right to an extension.

Very truly yours,
SIX COMPANIES OF
CALIFORNIA
By S. D. BECHTEL,
President.

cc—W. B. Boggs
cc—A. B. Tinning
cc—T. M. Price

[Endorsed]: U. S. Dist Ct. N. D. Cal. No. 20101-R. Plff's Ex. No. 47. Filed April 22, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk. [975]

Mr. Marrin: Mr. Tinning, I have a copy of a letter signed by Six Companies of California by S. D. Bechtel, President, dated August 23, 1935, addressed to the Board of Directors, Joint Highway District No. 13 of the State of California. Will it be stipulated that this is a copy of the original?

(Testimony of Stephen Davidson Bechtel.)

Mr. Tinning: So stipulated.

Mr. Marrin: And that it was sent by Six Companies and received by the District on or about that date?

Mr. Tinning: Yes.

Mr. Marrin: I offer that in evidence.

The Court: It may be admitted and marked.

(The letter was marked "Plaintiff's Exhibit 48")

Mr. Marrin: (Reading:)

PLAINTIFF'S EXHIBIT No. 48

August 23, 1935

Board of Directors,
Joint Highway District No. 13
of the State of California,
1448 Webster Street,
Oakland, California

Dear Sirs:

In Re: Construction of Broadway Low Level Tunnels.

At the present time we are engaged in installation of the type "A" concrete tunnel section, and while we will continue to proceed with the installation of same in the excavated portions of the two tunnels, we hereby notify you that we are informed and advised by our engineers that the section in question is inadequate and unsafe.

Under date of August 19, 1935, Messrs. T. L. Phillips and Fred H. Tibbetts, consulting engi-

(Testimony of Stephen Davidson Bechtel.)

neers of San Francisco, advised us in writing that the continued installation of the type "A" section endangers the structural safety of the work, the safe operations of ourselves as contractors, and the future safety of the public. They recommend that same be enlarged and strengthened and further reinforced in order to make same an adequate and safe installation suited to the nature of the ground conditions which have been encountered and for the uses to which the tunnel will be put after completion.

The condition of the ground encountered in the excavation of the tunnels thus far has been different from that contemplated by the geological report and the plans and specifications which form a part of our contract with you. All of the ground is of extremely heavy character, and treacherous in nature, and none of it is self-supporting; and the type "A" section was not resigned for such ground. It is particularly apparent that the type "A" section was not designed to be installed in ground which is not self-supporting.

Under these circumstances we will proceed with the installation of type "A" section of concrete under protest and upon notice to you as above stated; and we further hereby notify you that we do not assume any liability or responsibility for the safety or adequacy of any such installation, but, on the other hand, will pro-

(Testimony of Stephen Davidson Bechtel.)

ceed with such installation only upon condition that full liability of any kind, civil or criminal, which may arise from or be caused by installation of same be assumed by you.

In view of our conclusion above expressed, we shall feel free to discontinue the further installation of this type section unless within a reasonable time after receipt of this notification to you, you alter the design of the section to meet the objections thereto, or notify us in writing that you assume all responsibility and liability of any kind or character, civil or criminal, which may arise from the installation of same.

We are not now excavating in the headings of the tunnels on either the easterly or westerly end thereof; and we do not believe it wise to resume excavation therein until such time as you advise us whether or not you propose to alter or modify type "A" tunnel construction, as in the event a change is made in same, the excavation can be made to confirm to such altered design.

This letter is written without prejudice to any rights which may exist in our favor in connection with the entire subject matter, and for the purpose of putting you on notice. We understand that Mr. Phillips and Mr. Tibbetts orally notified Mr. Boggs, your engineer, on August 19th, 1935, substantially to the same

(Testimony of Stephen Davidson Bechtel.)

effect as herein stated, and we write this letter to make the matter one of record.

Yours very truly,

SIX COMPANIES OF CALIFORNIA

By S. D. BECHTEL,

President.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Plff's Ex. No. 48. Filed April 22, 1938. Walter B. Maling, Clerk. By J A. Schaertzer, Deputy Clerk. [978]

Mr. Marrin: I have here a copy of a letter dated August 28, 1935, from Six Companies of California, addressed to Board of Directors, Joint Highway District No. 13 of the State of California. Will it be stipulated subject to your check that it is a true copy of a letter sent by Six Companies of California to Joint Highway District No. 13 on or about the date thereof?

Mr. Tinning: It is a copy of a letter which was delivered personally at a meeting of the Board of Directors.

Mr. Marrin: Yes. I will offer the letter in evidence.

The Court: It may be admitted and marked.

(The document was marked "Plaintiff's Exhibit 49.")

Mr. Marrin (reading):

(Testimony of Stephen Davidson Bechtel.)

PLAINTIFF'S EXHIBIT No. 49

August 28, 1935

Board of Directors,
Joint Highway District No. 13,
of the State of California,
1448 Webster Street,
Oakland, California.

Dear Sirs:

Your attention is directed to the following:

1. The undersigned heretofore entered into a contract with your District for the construction of the Broadway Low Level Tunnel and approaches, to which contract and the documents forming a part thereof, and the geological report referred to in the specifications, reference is hereby made for a full and complete statement of the details thereof.

2. The parties intended, and the contract and documents above mentioned forming a part thereof, and the geological report, contemplated that the two tunnels included within the contract would be excavated thru ground which was represented to be and would be found to be self-supporting for nearly the entire length of the tunnels.

3. The design and the plans and specifications call for the installation of type "A" tunnel construction for 5,620 feet of the total length of tunnels. We notified you in our letter to you dated August 23rd, 1935, that type "A" tunnel

(Testimony of Stephen Davidson Bechtel.)

construction is unsafe and inadequate for installation in the entire length of ground thus far encountered in the tunnels.

4. The character of ground encountered thus far in the excavation for the tunnels, with but slight exception, has been and is entirely and radically different from the character of ground represented to the contractor as that which would be encountered, and is likewise radically different from the character of ground which was contemplated by the specifications, as is apparent from the terms and conditions set forth therein. By reason of this fact we have been required to do additional work, supply additional materials, and have been put to great additional cost and expense not contemplated or intended by the contract, and not intended to be borne or assumed by the contractor in the construction of the tunnels. You are hereby notified that we as contractor now do claim and will continue to claim against you for the entire additional cost and expense and the reasonable value, including a reasonable profit, of the additional work to which we have been and will be put, if we continue with the performance of our contract for construction of the tunnels.

5. At this time we are unable to furnish an exact detailed statement of the amount of our claim. It will include the reasonable value, including all cost and expense to which we may

(Testimony of Stephen Davidson Bechtel.)

have been heretofore or may be hereafter put, of all additional excavation, timbering, concreting, and labor and materials of any kind or character occasioned thereby, including any and all items attributable thereto of any kind or character.

6. You are further advised and notified that you are in default in performance of your obligations under our contract with you by reason of your failure to furnish necessary lines and grades and any other engineering which you are obligated to furnish under the terms of the contract.

7. You are further notified that we have and assert a valid claim for an extension of time for the performance of our contract arising from the causes heretofore stated to you in our request for such extension dated June 10th, 1935, and in addition to the extension of time requested therein, we now assert a right to and request such additional extension of time as may be necessary to complete the contract, in the event that we continue to perform same, based upon the following reasons in addition to those heretofore asserted:

(a) Heavy, treacherous and unforeseen character of the ground making construction more difficult and slower through no fault of the contractor;

(b) Inadequacy and unsafety of the design in accordance with our letter to you dated August 23, 1935;

(Testimony of Stephen Davidson Bechtel.)

(c) Additional work required to be done not included intended, or contemplated by the contract, plans and specifications.

8. By reason of the facts asserted in this letter a right to rescind our contract with you has arisen in our favor, but we do not desire to exercise such right unless it is absolutely necessary, as we consider that it is the primary purpose and object of the District to complete the tunnel and the entire project as speedily as possible. If we exercise our right to rescind at this time, it will result in great delay to the project and might result in loss of a portion of the work already done in the construction of the tunnels. We are anxious that the work be completed, and to complete same for you; and we assume that you are of the same mind.

9. We invite your consideration to the various matters set forth in this letter, but must inform you at this time that if we continue with the work it will be only upon the following conditions:

(a) That provision be made immediately to pay us the reasonable value of the additional work we have been called upon to perform, or which it may be necessary to perform hereafter.

(b) An extension of time be granted immediately which will enable us to complete the work without penalty unless delay hereafter occur which is due to our fault;

(Testimony of Stephen Davidson Bechtel.)

(c) Henceforth you perform all the necessary and proper engineering work, including the giving of all lines and grades, and assume responsibility for all engineering work which we have already performed and pay the cost of same.

10. We will proceed with installation of type "A" tunnel construction in the excavated portion of the two tunnels from the westerly end thereof, subject to the conditions specified in our letter to you dated August 23, 1935. We will do this for the purpose of preventing any loss that might otherwise occur of the excavated portion of the tunnels in which concrete has not yet been installed, unless notified by you to cease such work. We will not perform any other work in the construction of the tunnels under our contract with you unless notified within a reasonable time after receipt of this letter that the conditions set forth hereinabove are satisfactory and will be met by you.

Yours very truly,

SIX COMPANIES OF
CALIFORNIA
S. D. BECHTEL,
President.

SDB/b

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Plff's Ex. No. 49. Filed April 22, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk. [980]

(Testimony of Stephen Davidson Bechtel.)

Mr. Marrin: Mr. Tinning, Mr. Trefethen suggests, as you recall, that we would stipulate the time on August 28, 1935 when this letter was delivered.

Mr. Tinning: You will be surprised to know that our file copy of that has 3:30 P. M. endorsed on it by the Secretary of the District.

Mr. Marrin: Will you stipulate that was the time, then?

Mr. Tinning: Yes.

Mr. Marrin: Q. Mr. Bechtel, subsequent to August 28, 1935, did you have any further discussions with Mr. Boggs regarding the subject of extension of time? A. Yes.

Q. Will you state when, as nearly as you recall, the conversation was held, where it was held, who was present, and what was said?

Mr. Wittschen: The same objection, on all of the grounds heretofore stated.

The Court: The same ruling.

Mr. Wittschen: Exception.

A. About November 19, 1935, in the office of Six Companies of California, at the job site, Wallace Boggs, V. G. Hindmarsh, DeLancey Smith, and I met and discussed the project, including the method of timbering, the grouting, the removal of the cave-in, the general progress of the job, when the job would probably be completed, and this led into a discussion as to what period of extension of time Six Companies of California thought it was

(Testimony of Stephen Davidson Bechtel.)

entitled to, because [984] of the August 28th cave-in. Hindmarsh said that he felt, he thought we were entitled to 90 to 120 days. Boggs said in substance that he would not say what period of time, extension of time, we were entitled to, but that we were entitled to an extension of time growing out of the slide. The subsequent discussion referred to or brought up the matter of preparing a revised construction schedule. Boggs asked Hindmarsh to prepare a new construction schedule. Hindmarsh said that he would prepare a new construction schedule, and it would be ready about January 1, 1936. Boggs and Hindmarsh both said that they would then collaborate on the revised construction schedule, so that it would be in a form agreeable to both, and that they would also at that time collaborate on a form of application for extension of time and the period of extension of time which should be included in this new application for an extension of time, so that when it was prepared it would be in a form that Boggs could recommend and approve. Boggs said that it should be on non-controversial grounds, if possible, so as not to arouse the antagonism of the District's Attorney, Mr. Tinning. Boggs also said in substance that the District's objection to the extensions of time to date had probably not been caused by questioning our right to an extension of time, but it would be better judgment not to confuse the more major points of

(Testimony of Stephen Davidson Bechtel.)

controversy which existed between the district and the contractor.

Q. Is that all the conversation that you recall?

A. In substance.

Mr. Tinning: There are a number of letters following along from the last letter that you offered, dated August 28th. Do you propose to offer those?

Mr. Marrin: I propose to offer all of those documents, but I have not intended to offer them through Mr. Bechtel.

Mr. Tinning: We shall.

Mr. Marrin: That is all right. [985]

Mr. Tinning: On cross-examination, I just wanted to understand.

Mr. Marrin: I planned to introduce them by a witness who will follow, but we have no objection to your doing that. Mr. Tinning, I have here a copy of a letter written by Six Companies of California, dated February 25, 1936, to Mr. Thomas E. Caldecott, President, Directors Joint Highway District No. 13 of the State of California. Will it be stipulated that is a true copy of a letter sent by Six Companies of California?

Mr. Tinning: Yes.

Mr. Marrin: I offer that in evidence.

Mr. Wittschen: We object to it on the ground it is immaterial, irrelevant, and incompetent, self-serving, and has nothing to do with any controversy in the case. This is a letter offering to arbitrate all of the differences.

(Testimony of Stephen Davidson Bechtel.)

Mr. Marrin: That is correct.

Mr. Wittschen: Objected to on all of the grounds heretofore stated.

Mr. Marrin: It is a letter from the company to the District offering to arbitrate all of these differences between the plaintiff and the defendant in this case.

The Court: The legal objection is good. A jury is absent, however, and I will allow it.

Mr. Wittschen: Exception.

(The document was marked "Plaintiff's Exhibit 50.")

Mr. Marrin (Reading):

PLAINTIFF'S EXHIBIT NO. 50

February 25, 1936.

Mr. Thomas E. Caldecott,
President, Directors Joint Highway District No. 13 of the State of Calofirnia,
1448 Webster Street,
Oakland, California.

Dear Sir:

Our attention has been directed to an editorial in the Oakland Tribune of Monday, February 24th, in which it is suggested that an impartial investigation be made of questions arising out of the construction of the Broadway Tunnels.

You will recall that we have always been willing to submit any questions arising in our transactions with your directors to independent

(Testimony of Stephen Davidson Bechtel.)

and impartial consideration of any competent and disinterested group or board. In fact, we have urged such a course. As you will recall, on August 28th, 1935, and for some days before that time, we directed your attention to the possible hazard to workmen due to the construction of the present designed structure in the treacherous ground encountered, and at that time urged that you join with us in arranging for an independent board of engineers to determine whether our position was well taken.

We are writing you to assure that we welcome such independent investigation for the mutual benefit that may be gained therefrom, and it will be entirely satisfactory to us if the results of such an investigation are made binding on you and ourselves or are purely advisory.

In the event an independent board or authority is assembled to investigate the situation, we believe it would be advisable to have such a board consider the following general questions.

a. Safety of design from a construction and use standpoint.

b. Possible modification of design to expedite completion of the project and promote safety to workmen.

c. Whether ground conditions are radically different from those implied in the

(Testimony of Stephen Davidson Bechtel.)

design of the tunnel and predicted in the geological report, and if so, is the contractor entitled to a modification of its contract to meet actual conditions.

d. Whether contractor should be granted extension of time to complete the work.

Should the above suggestion meet with favorable consideration from you, we will be pleased to confer with you and your co-directors to expedite giving advice to such persons or public bodies as should be informed concerning our joint views.

Very truly yours,
SIX COMPANIES OF CALIFORNIA.
By S. D. BECHTEL,
President.

[Endorsed]: Plff's Ex. No. 50. No. 20101-R. Filed April 22, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

[986]

I have an original letter signed by Thomas E. Caldecott, addressed to the Six Companies of California, dated February 28, 1936. Will it be stipulated that that was sent by Mr. Caldecott and received by Six Companies of California on or about that date?

(Testimony of Stephen Davidson Bechtel.)

Mr. Tinning: Yes.

Mr. Marrin: I offer it.

The Court: It may be admitted and marked.

(The document was marked "Plaintiff's Exhibit 51.")

Mr. Marrin (Reading):

PLAINTIFF'S EXHIBIT NO. 51

Joint Highway District No. 13
of the
State of California

Oakland, Calif.,
February 28, 1936.

Six Companies of California,
Field Office—Post Office Box 120,
Berkeley, California.

Gentlemen:

Herewith in reply to your letter of February 25th, addressed to me as President, Board of Directors, Joint Highway District No. 13, by authority of the Board of Directors of Joint Highway District No. 13 of the State of California, I make the following reply to the letter referred to, following is a verbatim copy of the statement read to Mr. Kaiser and Mr. Trefethen who represented the Six Companies at a meeting of the Board of Directors of the District held today;

"The letter of Six Companies of California, dated February 25, 1936, addressed to me as

(Testimony of Stephen Davidson Bechtel.)

president of the Board of Directors of Joint Highway District No. 13, has been considered by the Board.

The questions which the Six Companies desires the Joint Highway District to join in submitting to an independent board for consideration fall into two classes: (1) Does the design for the permanent tunnel lining, in view of the ground conditions encountered in construction, provide a safe structure for use by the public in the future; (2) Questions involving the legal duties and responsibilities of the contractor under its contract for the construction of the tunnel for the District.

The contractor has stated that engineers employed by it have reported that if the tunnel is constructed in accordance with the design, that by reason of ground conditions encountered, the structure will be unstable, subject to failure, and thus endanger the lives and the investment of the public. This is contrary to the engineering information received by this Board from all of its engineers. The Board is willing to hear what the contractor and its consulting engineers wish to present in connection with the question of adequacy of the permanent structure, and due consideration will be given to the matter by this Board and its consulting engineers.

However, any such discussion must be limited to the question of safety to the public using

(Testimony of Stephen Davidson Bechtel.)

the tunnel, and must not include any discussion of the contractual obligations of the District or the contractor, such issues being governed entirely by the contract, and in case of a dispute between the parties can only be determined by a court of competent jurisdiction.

The question of safety to the workmen during construction is a responsibility that has been definitely assumed by the contractor which has agreed to take all measures necessary for the safety of its workmen in accordance with the valid regulations and safety orders of the Industrial Accident Commission of the State of California.

Upon receiving the engineering information above mentioned from you, preferably in writing, or if this is impracticable at a conference to be arranged for that purpose, the Board will give it the most careful consideration, and will take such further steps as may be advisable in the public interest."

Very truly yours,

(Signed) THOMAS E. CALDECOTT,
President—Board of Directors
of Joint Highway District No.
13 of the State of California.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Plff's Ex. No. 51. Filed April 22, 1938.

(Testimony of Stephen Davidson Bechtel.)

Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk. [988]

Now, I have here, Mr. Tinning, a copy of a letter sent by Six Companies of California, signed by Henry J. Kaiser, President, to Joint Highway District No. 13, dated February 29, 1936, which is a reply to Mr. Caldecott's letter. Will it be stipulated that is a true copy of a letter that was sent and received about that date?

Mr. Tinning: It is so stipulated.

Mr. Marrin: I will offer that in evidence.

The Court: It may be admitted and marked.

(The document was marked "Plaintiff's Exhibit 52.")

Mr. Marrin: This letter is dated February 29, 1936. (Reading):

PLAINTIFF'S EXHIBIT NO. 52

February 29, 1936.

Joint Highway District No. 13,
1448 Webster Street,
Oakland, California.

Attention of Hon. Thomas E. Caldecott,
President, Board of Directors

Dear Sir:

Replying to your letter of February 28th, the writer now has full authority to deal with the Board of Directors of Joint Highway District

(Testimony of Stephen Davidson Bechtel.)

No. 13, State of California, in behalf of Six Companies of California, and therefore you may consider this letter as a reply to your communication written to the Company under date of February 28th.

Your letter states that any discussions "must be limited to the question of the safety of the public using the tunnel" and that you are willing to give careful consideration to engineering information which may be submitted by the contractor. It is my understanding that several months ago, following the cave-in which occurred in August, discussions, extending over a period of a number of weeks, were had between your representatives and engineers employed by us, wherein the question of the ultimate safety and permanence of the completed tunnels (as well as other related problems) were given consideration; but no conclusive action resulted.

At our meeting on Friday, Mr. Boggs stated that these discussions and the engineering information submitted at that time were appreciated by him; but so far as we can learn, the opinions presented by us have never gotten beyond the consideration stage. Unless, therefore, some agreement concerning the practical problem of determining future action can be reached, I cannot see what, if anything, will

(Testimony of Stephen Davidson Bechtel.)

be accomplished merely by repeating the procedure followed several months ago.

Concerning the immediate problem of safety to the workmen during construction, you state that this "is a responsibility which has been definitely assumed by the contractor," and we infer from this statement that you take the position that this problem cannot be discussed. It is my view that because of circumstance beyond our control, and which are now more than ever apparent, this problem is a mutual one and cannot be separated from the more general problems relating to design, geology and methods of construction. Indeed, developments during the progress of the work have demonstrated the necessity of introducing construction of permanent character which was not contemplated and could not have been contemplated at the time the contract was undertaken. The responsibility for these changes—affecting, as they do, not only the immediate progress of the work but also the permanent structure—is, in my opinion, a matter jointly concerning both the contractor and the District.

Emphasizing this problem, we are in receipt of instructions from the Industrial Accident Commission of the State of California ordering us to "stop further driving of both tunnels until such time as future plans for driving are approved by the Industrial Accident Commis-

(Testimony of Stephen Davidson Bechtel.)

sion." This order is based upon the declaration that it is made "due to the character of the ground through which the Broadway Low Level Tunnels are being driven". Under the circumstances, unless some agreement concerning the practical problem of determining future action in this connection can be reached, I cannot see what, if anything, will be accomplished by the limited discussion which you have indicated you are willing to undertake.

Finally, your letter states specifically that any discussions "must not include any discussion of the contractual obligations of the District or the contractor, such issues being covered entirely by the contract, and in case of a dispute between the parties can only be determined by a Court of competent jurisdiction." As I have endeavored to indicate, practical problems—both immediate and ultimate—relating to the safety of the workmen and the safety and permanence of the completed tunnels, require full and fair discussion and determination at this time in the interests not only of the contracting parties, but of the workmen engaged in constructing the tunnels, the traveling public which may ultimately use the tunnels and the citizens of this community who have a direct and financial interest in the problems presented.

If the discussions are to be conducted within the limitations outlined in your letter, it is my

(Testimony of Stephen Davidson Bechtel.)

opinion that although they might be academically interesting, they could not in any sense accomplish any solution of our mutual problems. For instance, if it be determined after inquiry that changes in the design of the permanent structure are desirable from the point of view of ultimate safety, or that the construction cannot safely proceed, due to the character of the ground, under the plans and specifications, discussion of contractual obligations cannot be avoided.

The plain fact of the matter is that unless we can approach any discussions which may be undertaken with the idea of agreeing upon and carrying out a procedure which will solve the difficulties now presented, a further exchange of communications or the holding of further conferences will lead to no useful or practical conclusion. If you are willing to approach the matter from the point of view indicated in this letter, I can assure you that we will cooperate with you fully to arrive at some basis of mutual understanding which will allow the ultimate resumption of work in the tunnels and the completion of this contract on a basis of safety to the public, protection for the lives of the workmen and satisfaction to the Joint Highway District and Six Companies of California.

In order to facilitate any further action that may be taken, I have asked Mr. Paul St. Sure, who is known to you, to assist me in the matter,

(Testimony of Stephen Davidson Bechtel.)

and he is authorized to discuss related problems with your representatives.

Very truly yours,

SIX COMPANIES OF CALIFORNIA.

By HENRY J. KAISER,

President.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Plff's Ex. No. 52. Filed April 22, 1938. Walter B. Maling Clerk. By J. A. Schaertzer, Deputy Clerk. [990]

Mr. Marrin: I have a letter here, Mr. Tinning, dated January 12, 1935, addressed by Six Companies of California to Joint Highway District No. 13—rather, a copy of a letter, going back to another subject. Will it be stipulated that that is a true copy of the original, subject to your check?

Mr. Tinning: Yes, so stipulated, subject to check.

Mr. Marrin: That it was sent and received on or about that time?

Mr. Tinning: Yes.

Mr. Marrin: I would like to offer that in evidence.

(The letter was marked "Plaintiff's Exhibit No. 53.")

Mr. Marrin: This is a letter dated January 12, 1935:

(Testimony of Stephen Davidson Bechtel.)

PLAINTIFF'S EXHIBIT NO. 53

January 12, 1935.

Joint Highway District No. 13,
1448 Webster Street,
Oakland, California.

Gentlemen:

Referring to the establishment of the lines and grades in connection with the tunnel excavations, your attention is invited to letter of December 26, 1934, from our Mr. T. M. Price, Project Manager, to Mr. Wallace B. Boggs, District Engineer, and the letter of reply from Mr. Boggs to this company.

We are satisfied that our view of the matter is the proper one not merely under the general practice but also under the specific provisions of the specifications and we shall take up the matter further with you at a convenient early date.

In the meantime, in order not to delay the project, we are doing such of this work as is necessary for the immediate future but we believe that when we have conferred in the matter you will reimburse us for such expenditures as

(Testimony of Stephen Davidson Bechtel.)

we shall, in the meantime, have incurred in doing this work.

Yours truly,
SIX COMPANIES OF
CALIFORNIA.
By S. D. BECHTEL,
President.

San Francisco, California.

Attention of Mr. S. D. Bechtel, President

Dear Sir:

I wish to acknowledge the receipt of your communication of January 12, 1935 with respect to engineering work connected with the establishment of lines and grades in the tunnels.

I am unable to agree with your contention that engineers from the District should perform the work which you request; the Specifications definitely provide that you should do your own engineering, of which this is a part. The District cannot approve any claim for reimbursement for expenditures made by you for engineering.

It is noted that you state you desire to discuss this matter further, presumably with the Directors of the District and I shall be very

(Testimony of Stephen Davidson Bechtel.)

pleased to arrange this meeting at the mutual convenience of both parties.

Yours very truly,

(Signed) WALLACE B. BOGGS,
District Engineer.

Mr. Marrin: I have here, Mr. Tinning, a letter dated June 10, 1935, addressed by Six Companies of California, by S. D. Bechtel, President, to Joint Highway District No. 13. Will it be stipulated that that is a true copy of the original, and was sent and received at about that date?

Mr. Tinning: We will stipulate it is.

Mr. Marrin: I will offer that in evidence.

(The letter was marked "Plaintiff's Exhibit No. 55.")

Mr. Marrin: This letter is dated June 10, 1935, addressed to: "The Board of Directors, Joint Highway District No. 13 of the State of California, 1448 Webster Street, Oakland, California.

(Testimony of Stephen Davidson Bechtel.)

PLAINTIFF'S EXHIBIT NO. 55

June 10th, 1935.

The Board of Directors,
Joint Highway District No. 13
of the State of California,
1448 Webster Street,
Oakland, California.

Dear Sirs:

In connection with performance of our contract with you for construction of the Broadway Low Level Tunnel, we have heretofore discussed with your Chief Engineer, Mr. Boggs, and with your attorney, Mr. Tinning, the matter of performance of engineering work.

Since the beginning of the work and at the present time we are performing certain engigineering work which is necessary for the proper construction of the project, and which we believe to be work which the District is obligated to do rather than ourselves under the terms of the contract and specifications covering the job.

Up to the present time we have done this work although protesting that it should be done by the District, and that the doing of same was not a part of our obligation. We have done

(Testimony of Stephen Davidson Bechtel.)

this in order that the job might continue without a shut-down, and are continuing to do same although we contend we are not obligated to do it.

At this time we desire to notify your District that we have done and are doing this work under protest, and that we shall and do hold you responsible for the doing of same and the results thereof, and for the cost of same.

In this connection it is our contention that it is the obligation of the District to furnish all necessary engineering to enable us to proceed with the performance of our contract, and that up to this time the District has not furnished such engineering.

Any engineering furnished by us which we believe should be furnished by the District has been so furnished by us without any recognition on our part of an obligation to furnish same; and to such extent as we may hereafter furnish any such engineering, this will advise you that we will do so under protest, if we do so at all, and will further advise you that we shall and do hold the District responsible for the results of any engineering so furnished by us which we contend the District is obligated to furnish,

(Testimony of Stephen Davidson Bechtel.)

and will further hold you responsible for the cost of same to us.

Very truly yours,

SIX COMPANIES OF CALIFORNIA.

By S. D. BECHTEL,

President.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Plff's Ex. No. 55. Filed April 22, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk. [996]

Mr. Marrin: I have here, Mr. Tinning, an original of a letter from Joint Highway District No. 13, by Harry M. Stow, Secretary, dated July 12, 1935, addressed to Six Companies of California. Will it be stipulated that that is the original, and was sent and received at about that time?

Mr. Tinning: Yes.

Mr. Marrin: And no objection to offering a copy in evidence?

I will offer that in evidence.

(The letter was marked "Plaintiff's Exhibit No. 56.")

Mr. Marrin: This letter is dated July 12, 1935, addressed to Six Companies of California, 155 Sansome Street, San Francisco, California, and reads as follows: [997]

(Testimony of Stephen Davidson Bechtel.)

PLAINTIFF'S EXHIBIT No. 56

Joint Highway District No. 13
of the State of California

Oakland, California
July 12, 1935

Six Companies of California,
155 Sansome Street,
San Francisco, California.

Attention Mr. S. D. Bechtel, President

Gentlemen:

The Board of Directors of Joint Highway District No. 13 has directed me to advise you that your letter of June 10, 1935 respecting the performance of engineering work by the District rather than yourselves, has been given full consideration.

The Board of Directors has concluded that the engineering work performed by the District Engineer is fully in accordance with the terms of the contract and the plans and specifications covering the work. The Board also is of the opinion that your purported protest and demand that the District provide engineering service for you, in addition to that which has been provided since the commencement of your work under the contract, and is now being provided, is not well-founded, and that your statement that you will hold the District respon-

(Testimony of Stephen Davidson Bechtel.)

sible for the cost of engineering and the results thereof, is not justified in law or in fact.

You are further advised that this District and its employees will continue in the future to assist and cooperate with you toward the successful completion of the project you undertook to construct under your contract of June 4, 1934. This District, however, does not contemplate deviating from the spirit or letter of the contract and the plans and specifications under which the work is being done, and expects you to proceed under the contract in accordance with law.

Yours very truly,
JOINT HIGHWAY DISTRICT No. 13
OF THE STATE OF CALIFORNIA
By (Signed) HARRY M. STOW
Secretary

HMS:EK

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Plff's Ex. No. 56. Filed April 22, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

Mr. Marrin: I have here a copy of a letter signed by Six Companies of California, by S. D. Bechtel, President, addressed to the Board of Directors, Joint Highway District No. 13 of the State of California, dated July 26, 1935,—addressed to the

(Testimony of Stephen Davidson Bechtel.)

Board of [998] Directors; and that is dealing with engineering.

Mr. Tinning: We will stipulate to that.

Mr. Marrin: You will stipulate that that is a true copy. We will offer that in evidence.

(The letter was marked "Plaintiff's Exhibit No. 57.")

Mr. Marrin: This is a letter dated July 26, 1935, addressed to the Board of Directors, Joint Highway District No. 13 of the State of California, 1448 Webster Street, Oakland, California. It reads:

PLAINTIFF'S EXHIBIT No. 57

July 26th, 1935

Board of Directors,
Joint Highway District No. 13
of the State of California,
1448 Webster Street,
Oakland, California.

Dear Sirs:

Under date of June 10th, 1935, we directed a letter to you concerning the doing of the engineering work in the construction of the Broadway Low Level Tunnel, to which letter we direct your attention. Under date of July 12th, 1935, you made reply to this letter, which has had our consideration.

Before we wrote the letter of June 10th, above mentioned, we had frequently contended to your Engineer and your attorney for the

(Testimony of Stephen Davidson Bechtel.)

position which we asserted in that letter, and we continued to contend for the same position that the contract and specifications provide for the doing of engineering work by the District which has been done by us as noted in our letter of June 10th. You take the opposite view. We believe our position is correct and that a difference of opinion has arisen which should be settled. We are sincere in our contentions and we assume that your views are likewise sincere. Therefore, the difference of opinion or dispute as to the true meaning of the contract and specifications raises a question concerning which both you and ourselves should welcome a determination.

Under the circumstances, we believe that the question at issue should be submitted to arbitration; and that both of us should agree to abide by the result of such arbitration. Accordingly, we are writing this letter to suggest to you that the question involved be submitted for final decision and determination to arbitration.

In the event our proposal is acceptable we suggest that an agreement for submission to arbitration be immediately arranged between us. Such agreement should provide in general for

(a) naming of three arbitrators if we can agree on their names; otherwise it should provide for selection of arbitrators, one to be

(Testimony of Stephen Davidson Bechtel.)

named by you, one by us, and one by the two thus named;

(b) manner of presentation to the arbitrators, including provisions for time limitations within which hearings should be held and decision made;

(c) payment of expenses of the arbitration.

The questions which we suggest should be submitted to the arbitrators would be stated in such agreement for arbitration, and in our opinion should be stated substantially in the following form:

First: What are the obligations of the District and the contractor respectively under the contract and specifications for the construction of the Broadway Low Level Tunnel for the doing of any and all engineering work necessary to the performance and completion of the contract;

Second: Has the District done and furnished to the contractor since the commencement of performance of the contract for the construction of the Broadway Low Level Tunnel all of the engineering which it is obligated to furnish under the terms and provisions of the contract and specification covering the work;

Third: If it be found that the District has not furnished all of the engineering which it is obligated to furnish, what has been the extent of its failure in this respect, and what has been

(Testimony of Stephen Davidson Bechtel.)

the cost to the contractor for furnishing same;

Fourth: If it be found that the contractor has been doing and furnishing engineering work which should have been done and furnished by the District, responsibility for the same and the results thereof shall be determined as being upon the District, and the District shall likewise be held liable to pay to the contractor the cost to which it has been put as found by the arbitrators for doing and furnishing such engineering work.

Any award or decision of the arbitrators should be made binding upon both parties for the remainder of the life of the contract.

We trust you will be able to approve of the above program in order that the controversy now existing on the subject may be settled. We believe arbitration to be the preferable method of settling same as it can be quickly consummated and the expense thereof will not be prohibitive.

In the event that you are unwilling to submit the matter to arbitration, we will expect to immediately commence such legal proceedings as may be necessary or proper to determine our rights in the matter.

In order that a speedy settlement may be reached, we ask that you reply to this letter by August 7th, 1935. If we do not receive an affirmative answer by that date, we will consider

(Testimony of Stephen Davidson Bechtel.)

that you do not care to arbitrate the matter and commence such legal proceedings as may be proper, as above suggested.

Very truly yours,

SIX COMPANIES OF CALIFORNIA

By S. D. BECHTEL

S. D. Bechtel, President

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Plff's Ex. No. 57; Filed April 22, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer. Deputy Clerk. [999]

Mr. Marrin: You may cross-examine.

The Court: It is Friday afternoon; if you are not prepared to proceed with your cross-examination, we can adjourn at this time.

Mr. Tinning: My theory on that, your Honor, is we could save time. I was not aware, of course, who was going to follow Mr. Larson. We have quite a lot of documents that I would like to get in order.

The Court: We will take an adjournment until next Tuesday morning at ten o'clock.

(Thereupon, an adjournment was taken until Tuesday, April 26, 1938; 10 o'clock A. M. [1001]

(Testimony of Stephen Davidson Bechtel.)

Tuesday, April 26, 1938;
10:00 o'clock A. M.

STEPHEN DAVIDSON BECHTEL,

Cross Examination

Mr. Tinning: If the Court please, we have a diagram or perspective drawing of the region of San Francisco Bay and the project of the District, which is drawn to perspective and was prepared from one of the architectural drawings that were used in connection with the proceedings in the formation of the District. This diagram is simply offered for the purpose of illustrating the testimony; it is not to scale; and it shows, between the points that I indicate on the east of the tunnel, generally, the extent of the District project, as marked in yellow; the highway is shown; the east portal building is shown; the east side of the hills; the west portal building; and the cut being generally shown; the west side of the hills; and then the highway leading down to Broadway in Oakland to the point where the yellow stops; that is the westerly termination of the District project, and to the cross or intersecting road known as the Landale Connection,—or whatever that short-cut from Berkeley is called,—across the main access of the project to East Oakland, known as the Landvale-Berkeley Connection.

For the purpose of some questions that I have in mind of the witness, I would like to offer that as

(Testimony of Stephen Davidson Bechtel.)

defendant's exhibit in proper order; and I understand there is no objection to it being put in for diagrammatic purposes to illustrate the testimony.

Mr. Marrin: No objection.

Mr. Wittschen: Mr. Tinning, from the distance here, I am sure the Court cannot see where the tunnels are.

Mr. Tinning: The dotted line—this being a perspective view, your Honor, of the country, the dotted line has been used to [1002] indicate the places where the tunnels are constructed between the west portal and east portal, running through under the hills. There is a dotted line above, higher up, which is intended to indicate the position of the Old Highway Tunnel, to which there has been some reference in the testimony, and the road which is shown by a white line meandering around the contour of the hills—and I am indicating from the west portal of the Old Tunnel down to the easterly boundary of Berkeley is what is known as the Old Tunnel Road.

(The diagram was marked "Defendant's Exhibit P.")

[Set forth in the Book of Exhibits at page 370.]

Mr. Tinning: Q. Mr. Bechtel, I understood from your testimony on last Friday that you resided in Oakland. Is that correct? A. Yes.

Q. How long have you lived in Oakland?

A. Off and on since 1912.

Q. You are familiar and have been familiar with

timony of Stephen Davidson Bechtel.)

Contra Costa-Alameda County hills, through h the tunnel was built, for a great many years?

I have known they are there.

Well, I suppose, on occasions, you have ac- y crossed over them?

Yes, I have crossed over them.

And gone through the Old Tunnel?

Yes.

How long were you a member of the firm of . Bechtel Company before the formation of the tiff Six Companies of California?

Since its organization.

When was that? A. I believe, in 1925.

When did you first engage in the contracting ness? From 1925—is that the time you started lly working as a contractor—is that correct?

No. I started immediately on getting out of ol, or before I got out of school.

When was that?

Well, it goes back to probably 1912; having raised in construction camps, and having spent tically all my life, since then, either in construc- camps, around [1003] construction, or in the y, or in school.

This experience goes back to 1912—Was it that you have had experience in charge of or in ection with the work of driving tunnels?

Yes.

What tunnels have you actively been engaged orking on, prior to taking over the work of

(Testimony of Stephen Davidson Bechtel.)

preparing the bid for the Broadway Low Level Tunnel?

A. The Southern Pacific Company's Coram Tunnel near Redding.

Q. About what year was that?

A. About 1924 or 5.

Q. What kind of a tunnel was that?

A. Railroad tunnel that had burned out, caved in; and our contract was for the removing of the caved-in materials, and lining the same and restoring same to traffic.

Q. Prior to the fire, had it been a timber lined tunnel?

A. I think, at least in part.

Q. What kind of a lining did you restore?

A. Concrete.

Q. Did you employ a timbering operation?

A. Temporary timbering.

Q. Temporary timbering before you placed the concrete? A. In part.

Q. Did you leave the timber in behind the concrete? A. I believe so.

Q. Following your experience, about 1924, in the Coram Tunnel, what was your next tunnel experience?

A. Well, I believe, before that, that while I was still in school,—still in college,—I had worked on the Plumas County Tunnels of the Great Western Power Company; that was probably in 1922 or '23.

(Testimony of Stephen Davidson Bechtel.)

Q. The Western Pacific Tunnels in Plumas County?

A. I mean Great Western Power Company.

Q. Great Western Power Company?

A. Yes.

Q. Those were how large?

A. 10 or 12 feet in diameter, and some 5 or 6 miles in length.

Q. Those were driven through the Sierras?

A. Yes; they were in the Sierra Nevada Mountains.

Q. Hard rock tunnels? A. In part. [1004]

Q. Was there some heavy, heaving ground, soft materials, in those tunnels?

A. Not in the portion that we built.

Q. The Coram Tunnel that you referred to: did that present the same problems,—driving through hard rock or soft materials? A. Both.

Q. So, you had materials to cut through that were not self-supporting and materials that were, in the same tunnel? A. As I recall.

Q. In what capacity were you employed on the Coram Tunnel work?

A. Well, it was what you might call resident partner. I was participating in the company, or in my father's business; it was carried on as an individual, and I was a junior partner.

Q. You had an interest in the operation?

A. Yes.

Q. Following the Coram Tunnel operation, what was your next experience in tunnel work?

(Testimony of Stephen Davidson Bechtel.)

A. I believe it was the Southern Pacific American Canyon double tracking, which was about 1925; somewhere around there; and it consisted of—I presume you want me to give the same information on that tunnel?

Q. Yes, just generally.

A. That consisted of concreting, under traffic, a railroad tunnel.

Q. That was in the Sierras?

A. In the Sierras.

Q. What was your next experience after that?

A. In 1926, I was in Oregon, again as resident partner up to the time we were organized, but it was not organized as "resident partner"; it consisted of concrete lining and timbering and retimbering of eight tunnels on the Cascade Line of the Southern Pacific.

Q. Then, following that experience in 1926, what did you do next in connection with tunnel work?

A. Well, next to this same operation, I was also in charge for our company of the handling of the Chicago Pneumatic placing equipment; that is a concrete gun,— [1005] predecessor, I believe, one might call it, to the Hackley gun; and which we handled, and represented the Chicago firm on the Pacific Coast; and I handled that business in our office.

Q. In handling that business, did you have to do with the problem of placing concrete in linings in tunnels?

(Testimony of Stephen Davidson Bechtel.)

A. Well, we were licensees, Western representatives and sole licensee, and issued sub-licenses to the various users of the Pneumatic gun.

Q. In your work, did you come in contact with the problems of the actual men who were using this equipment in placing concrete in tunnel linings?

A. Very indirectly, Mr. Tinning.

Q. Following that work in connection with the Southern Pacific Tunnels in the Sierras Nevadas, what was your next experience with tunnels?

A. Well, probably my next direct contact was at Boulder Dam, at which point I was on the Executive Committee of the Board of Directors, and was directly in charge of the procuring of equipment, materials and supplies for the entire project, including the tunnel portions, and, as such, reviewed with the other members of the Executive Committee, —all of whom were Directors,—the matters of planning and equipping the Boulder Dam Tunnels.

Q. Those tunnels were how large, Mr. Bechtel?

A. The finished diameter was approximately 50 feet.

Q. The excavation, outside the permanent lining?

A. Minimum of approximately 56 feet in diameter.

Q. So that the lining was how thick?

A. I would say an average of approximately 3 feet.

Q. Concrete lined? A. Yes.

Q. How high were the tunnels?

(Testimony of Stephen Davidson Bechtel.)

A. They were circular; 56 feet high and 56 feet wide, before lining, approximately.

Q. Well, were those tunnels, throughout, circular?

A. Practically throughout, except a slight transition period where the spillway [1006] overflowed, came into the tunnel; but the main bodies of the tunnels proper were circular.

Q. Were those tunnels driven by the full face method, with the Jumbos and drifters?

A. In major part.

Q. Did they require timbering?

A. Very little, if any.

Q. Was the timber left in behind the concrete?

A. There was very little timbering placed, so it could not have been left in.

Q. How many lineal feet of those tunnels was that?

A. As I recollect, approximately 4 tunnels; and they were approximately 4000 feet long, each; that is an approximation.

Q. Those were driven in a hard rock of the type of the mountain, or high mountain rock, were they not? A. Not necessarily.

Q. Well, I am asking you whether they were or not, Mr. Bechtel.

A. Will you repeat the question?

The Court: Read the question.

(Pending question read by the reporter.)

The Witness: A. In part.

(Testimony of Stephen Davidson Bechtel.)

Mr. Tinning: Q. Is there any soft ground in the Boulder Tunnel—Boulder Dam Tunnels?

A. Very little.

Q. And the formation was quite different from anything encountered here in the Coast Range Mountains in the vicinity of San Francisco Bay?

A. Generally speaking, yes.

Q. Mr. Bechtel, I call your attention to Thursday, the 15th day of September, 1932, and ask you if you recollect a visit to the office of Wallace B. Boggs, District Engineer of the defendant Joint Highway District, at its office at 1448 Webster Street, in Oakland, California, at which time your father, —W. A. Bechtel, —yourself, your brother Warren Bechtel, Junior, J. B. Shaw of the W. A. Bechtel Company, visited that office and had a conference or a conversation with Mr. Boggs, at which time the District Assistant Engineer, [1007] Joseph Barkley, was present—Do you remember that incident? A. No.

Q. Shortly after Mr. Boggs was appointed District Engineer, after Mr. George Posey's death?

A. Might I——

Q. Well, do you remember the incident, Mr. Bechtel?

A. Yes, except as of a specific date, Mr. Tinning; I have no recollection of a specific date; but that is—When I say that, that is the reason. You asked whether I remember a specific date.

(Testimony of Stephen Davidson Bechtel.)

The Court: Q. Do you recall a meeting, with those men present that he has enumerated, at any time?

A. I recall a meeting and discussion with Mr. Boggs.

Q. When was that, as near as you recall?

A. During 1932.

Q. Who was present at that meeting?

A. My father, my brother, —W. A. Bechtel, Junior, —Joseph Shaw, myself, and, to the best of my recollection, Mr. Wallace Boggs, only.

Q. Was that the first meeting you had with him?

A. To the best of my recollection.

The Court: Proceed.

Mr. Tinning: Q. You went over there to discuss with Mr. Boggs the type of tunnel, the general plans that he might have for the construction of this project for which he had just been employed as District Engineer?

Mr. Marrin: We object to any evidence of this conversation, on the ground it is incompetent, irrelevant and immaterial, and it is too remote in time; it is not binding on this plaintiff. The evidence shows that this plaintiff was not organized until May 15, 1934; and an attempt is being made to bring out here evidence of a conversation which occurred more than a year and a half prior to that time.

Mr. Alexander: I join in the objection. [1008]

Mr. Wittschen: I will state, if the Court please,

(Testimony of Stephen Davidson Bechtel.)

we will tie it right in to this witness's testimony wherein he said he relied upon the estimate of Mr. Larson and Mr. Larson's interpretation of the geological report; and we will show a conversation with the late Mr. Bechtel,—the witness's father,—relating to the original construction of this tunnel, and his knowledge; and, of course, the witness's knowledge of conditions, because the witness was present.

Mr. Marrin: I would like to state the further ground of the objection is that at the time there had been no call for bids for this project, no showing that there was any definite project or that the plans and specifications had been prepared, or that there had been any call for bids or any public request for this contract at all.

Mr. Wittschen: If we can show a knowledge of conditions in 1932, certainly that knowledge ran through to 1934. The fact the company was not organized is immaterial. These people put in all sorts of evidence to the effect that, before the company was organized, Mr. Larson was working for Mr. Bechtel.

Mr. Marrin: All of that evidence related to matters which occurred after the first call for bids and after they got the plans and specifications that were issued by the defendant in connection with the particular project.

Mr. Wittschen: We offer to prove the knowledge of the witness of the conditions under which the

(Testimony of Stephen Davidson Bechtel.)

tunnel would be driven and which he knew before the bid was made.

The Court: The Court will allow it for the limited purpose of the offer.

Mr. Marrin: Exception.

Mr. Alexander: Exception.

Mr. Tinning: Q. At that time and place, Mr. Bechtel, did you hear your father state to Mr. Boggs and the people present that, [1009] in his opinion, a large tunnel bore through the Alameda-Contra Costa County Tunnel, at the point where the tunnel was proposed to be constructed, would present many hazards?

A. I have no such recollection, and I do not believe it was said.

Q. Did you further hear him state, in this conversation, that often smaller bores would encounter trouble sections, particularly if swelling ground were encountered?

A. I have no recollection, and I don't believe he said that.

Q. Did you hear your father state, in that conversation, that he did not like arch inverts in tunnels of small sections, except where they sometimes were necessary to hold a rising floor?

A. I have no such recollection, and I do not believe he said that.

Q. Did you also hear, in that conversation, Mr. Bechtel, your father state that, in his opinion, the bid price of the twin bore tunnels of small sections

(Testimony of Stephen Davidson Bechtel.)

would be lower than the bid price for a larger single bore tunnel, even though the quantity of excavation and concrete for both types of tunnel would be equal?

A. I have no such recollection. I do not believe he could have said that.

Q. In the same conversation, did you hear your father state that he would not want to bid at all on a larger section, because of his knowledge of the hill through which the tunnel would be driven?

A. May I have that question?

Mr. Tinning: Read the question, please.

(Pending question read by the reporter.)

The Witness: A. No.

Mr. Tinning: Q. Did you, on that occasion, hear your father state that he did not think that a pioneer or exploration bore was necessary, or that the same would be of any particular advantage except for the purpose of determining which type of tunnel bore [1010] should be used?

A. No; and I don't think he said that.

Q. What did he say, at that conversation, Mr. Bechtel?

A. I have no recollection of what he said.

Q. Your only recollection is that you were present some time in 1932, at Mr. Bogg's office, and that office is the same office where the District is now domiciled over on Webster Street; that is the only thing you recollect about it?

(Testimony of Stephen Davidson Bechtel.)

A. No; I have some recollection of that discussion.

Q. Well, what was said at that time and place?

A. Not that clear a recollection of what was said; but the discussion that was of a preliminary nature only. We went there for the purpose of asking whether there was going to be a tunnel construction contract available. Our general interest in such things—and we were interested in various projects, wherever they might be; and there were no plans or specifications. I, personally, had never been on the job site, and I don't think my father or brother had been to the job site; and it was of a preliminary nature of the kind a contractor makes, or engineer would make, in thinking of a prospective project some time in the future.

Q. And, in thinking of the prospective project some time in the future, at that time you knew that Mr. Boggs had just come on the work as District Engineer, Mr. Posey having died in August, 1932?

A. I did not know that.

Q. Will you repeat what was said at that conversation, so well as you can, saying what was said by you and your father and Mr. Boggs?

A. Mr. Tinning, I tell you I don't recollect what was said.

Q. You don't recall that? A. No.

Q. In 1933, did the W. A. Bechtel Company subscribe to the Western Construction News?

A. I presume that it did.

(Testimony of Stephen Davidson Bechtel.)

Q. You said you had gone to Mr. Bogg's office for the purpose of finding out that work that might be coming up. Do you recollect [1011] reading the article, in July, 1933, in the Western Construction News, describing the project?

A. I have no such recollection. [1012]

Q. Do you remember reading the matter on page ——

Mr. Marrin: I object to your reading the article in evidence. You can show him the article and ask him if he read it. If he has not read it I object to it being read into the record.

Mr. Wittschen: I think we have a right to offer it, because he has not said he is not a subscriber to the Western Construction News. I am satisfied if the witness said he was a subscriber that we have a right to introduce the article.

Mr. Marrin: That is not the point. He has not seen the article, and I object to the article being read in evidence in this case, or into the record, until it is offered.

Mr. Tinning: I do not understand that the witness testified that he has not seen it, he said he did not remember it.

Mr. Marrin: I would like you to develop it, and when you offer it I would like it offered before you read it, so that I may have a chance to object to it.

Mr. Tinning: I am not asking you whether you saw it at that time, I am asking whether you see it right now.

(Testimony of Stephen Davidson Bechtel.)

A. I see it right now. However, I will state that——

Q. Just a minute, I have not asked you any question yet. Isn't it a fact that in 1933, following the publication of this article, that you saw it?

A. I have seen it this morning.

Q. Will you read the question, Mr. Reporter?

(Question repeated by the reporter.)

A. No.

Q. Do you have any recollection of having read this article or the portions thereof which I will now read to you——

Mr. Marrin: That is my objection, to his reading the article.

The Court: I will allow him to make a record. Let us proceed in the regular way. Let him conclude the question and it will be [1013] time enough then to object.

Mr. Tinning: Q. (Continuing) Reading from page 318 of the issue of July, 1933, Western Construction News and Highway Builder:

> "Both tunnel sections will be 35 feet out to out in excavation and 34 feet high. A reinforced concrete lining will be placed throughout, varying from 2 feet thick at the crown of the arch to 5 feet at the haunch. The tunnel is expected to require support for practically the entire length of each bore, and the contractor will be allowed to place either timber sets and lagging or steel ribs and liner plates back of the con-

(Testimony of Stephen Davidson Bechtel.)

crete. Where practicable, the upper part of the arch is to be poured last, so as to key the tunnel structure. Concrete specifications are based upon cement content and slump."

"Two types of tunnel are provided in the design: Type 'A', with no invert, the walls coming down to spread footings on rock and the 8-inch Portland cement concrete pavement resting directly on the excavated sub-grade; and type 'B', carrying an invert, for use, if ground conditions are unfavorable."

A. No, I have no recollection of ever having read them.

Mr. Tinning: We will offer them in evidence, if your Honor please.

Mr. Marrin: To which we object on the ground they are immaterial, irrelevant and incompetent, and on the further ground that they are hearsay.

Mr. Alexander: We join in the objection.

Mr. Wittschen: In that connection, this is an engineering publication that is published in San Francisco, and he has not said that his firm were not subscribers, in fact, he has practically admitted that they were, anything as notorious as that about this [1014] project, is admissible as general knowledge.

Mr. Marrin: This witness has testified he has not seen or read the article and it is simply a newspaper article.

The Court: At this time the Court will sustain

(Testimony of Stephen Davidson Bechtel.)

the objection on the ground the foundation has not been laid.

Mr. Tinning: Q. Isn't it a fact that the W. A. Bechtel Company was a subscriber to the Western Construction News and Highway Builder in the month of July, 1933?

A. I believe that it was, Mr. Tinning, I am not sure, but I presume that it was.

Q. Didn't you have copies of this engineering publication in your office and keep them there?

A. Some publications.

Q. How about the Western Construction News and Highway Builder?

A. Well, I presume that if we were subscribers at that time it probably was in the office and probably was kept there.

Q. Then my understanding is that you, yourself, have no knowledge of whether it was there, you simply presume that it was?

A. I presume that we were subscribers at that time.

Mr. Tinning: We make the offer again, your Honor.

Mr. Marrin: I will renew the objection, and the further ground that no proper foundation has been laid.

Mr. Alexander: The same objection for the Surety Companies.

The Court: At this time the Court will sustain the objection on the ground heretofore stated.

(Testimony of Stephen Davidson Bechtel.)

Mr. Wittschen: Exception.

Mr. Tinning: Mr. Marrin, I will show you a copy of a letter dated July 20, 1934, from Six Companies of California to Wallace B. Boggs, District Engineer, and I assume that under the understanding we have previously had I may introduce a copy rather than the original, subject to check.

Mr. Marrin: Surely.

Mr. Tinning: If your Honor please, we offer in evidence the [1015] letter referred to, dated July 20, 1934, from Six Companies of California, signed S. D. Bechtel, President, to Wallace B. Boggs, District Engineer, as Defendant's Exhibit in proper order.

The Court: It may be admitted and marked.

(The letter was marked

"DEFENDANT'S EXHIBIT Q.")

Mr. Tinning: The letter reads as follows:

"Mr. Wallace B. Boggs, District Engineer,
Joint Highway District No. 13,
Oakland, California.

"Dear Mr. Boggs:

"We wish to advise you of the organization we are using in the field for the construction of Broadway Tunnel.

"W. R. Fontaine is in complete charge of all field operations.

"L. M. Larsen is superintendent in charge of tunnel operations.

(Testimony of Stephen Davidson Bechtel.)

"J. F. Barber is superintendent in charge of outside and subcontracted operations.

"Yours very truly,
SIX COMPANIES OF CALIFORNIA
By (Signed) S. D. BECHTEL,
President."

Q. Referring now to Defendant's Exhibit N, Schedule of Progress submitted on August 9, 1934, showing the work of excavation at the west portal which commenced on July 20, 1934, Mr. Bechtel, so that you may have this before you I will show you a copy of what is Defendant's Exhibit N in the case, and ask you if this is a construction schedule that was presented by Six Companies to the District with its letter of August 9, 1934, that is already in evidence? A. Yes.

Q. And I will ask you if at that time didn't your proposed construction schedule show that you proposed to commence the construction at the west portal on the 15th of July, 1934?

A. Well, I think it shows whatever we were thinking of at that time. [1016]

Q. Will you look at it, please, and see if it is not a fact that it does show that?

A. It shows about the 20th.

Q. The 20th?

A. Yes, the 20th of July, 1934.

Q. From this schedule, which is already in evidence as Defendant's Exhibit N, it is true, is it not, Mr. Bechtel, that prior to the time that this schedule

(Testimony of Stephen Davidson Bechtel.)

was submitted on the 9th of August, 1934, that there already had been slides in the west portal cut area?

A. I don't recall whether there had been or had not been at that time.

Q. You don't recall that? A. No.

Q. You don't recall that as early as July 13 there had been slides in that area? A. No.

Q. You don't recall that the plaintiff in this case, the Six Companies of California, had made any written complaints to the District at this time that it had been deceived by the geological report or deceived by the condition which it had actually encountered there?

A. Would you read that question?

(Question repeated by the reporter.)

I do not recall that.

Q. Well, you have been over the records of the company. Did you find anything or do you know now of any written complaint that was made by the Six Companies to the District at this time, August 1, 1934, or at the time that the schedule was submitted on the 9th of August, 1934, where Six Companies contended in writing that it had been deceived or misled?

A. Well, I probably had better say I have not been over all of the records of the company, Mr. Tinning.

Q. Do you know of any complaints that were made?

A. I can't remember at this time.

(Testimony of Stephen Davidson Bechtel.)

Q. You have no recollection? A. No.

Q. Was there any demand made for extra compensation for the slides [1017] at the west portal of the tunnel at this time?

A. At that date?

Q. Yes.

A. I have no recollection on that subject.

Q. Isn't it a fact, Mr. Bechtel, that the work on this west portal, the open cut, the west portal cut, the foundation walls and the construction of the building was sub-contracted by Six Companies of California to subcontractors very shortly after Six Companies entered into this contract with the district?

A. You are speaking about the building, the excavation for it?

Q. The building and the excavation for the westerly portal cut, both? A. Yes, in part.

Q. Will you explain?

A. The portal buildings were subcontracted; the grading was subcontracted in general, and that subcontract for grading was slightly modified thereafter.

Q. Do I understand when you say the grading, that you are referring to the grade of the project from Broadway up to the west portal and from the east portal to the east end of the project?

A. It was intended to subcontract all outside excavation there.

(Testimony of Stephen Davidson Bechtel.)

Q. Was that done shortly after you took the contract? A. Yes.

Q. So that at the time that work started at the west portal cut the work was being done by subcontractors? A. Yes.

Q. Of your own selection? A. Yes.

Q. And the manner and the order in which they proceeded was a matter which had been determined by Six Companies in the contract which it had made with the subcontractors?

A. Substantially, yes.

Q. Any interference with the tunnel-driving operations of the Six Companies was due to the subcontractors' operations at the west portal, was it not, at the time? A. In part.

Q. It was true, was it not, that you had to stop work on the attempt to get underground in the tunnel which was started about the [1018] 6th of August, because one of the contractors, K. E. Parker, protested that you were interfering with their work under their contract?

A. No, I think you are confused on that, Mr. Tinning. It is my recollection that the schedule of that work and the work, itself, as of such a nature and had to be carried on in such a fashion that certain parts could not be carried on simultaneously, and at our suggestion certain parts of the several subcontractors' work were delayed to correlate and to synchronize, so that we could make the maximum speed possible.

(Testimony of Stephen Davidson Bechtel.)

Q. Mr. Bechtel, isn't it a fact that the efforts to go underground made by Six Companies who had not subcontracted the tunel driving were stopped from August 3 to August 23 while the K. E. Parker Company was permitted to go ahead in the construction of the foundation work under the building? A. I don't remember that.

Q. So that any interference that resulted to the Six Companies from their attempt to start the driving of this tunnel was the result of subcontractors being there, was due to the fact that Six Companies had brought subcontractors there?

A. In part.

Q. What do you mean by in part?

A. Well, as any construction project goes ahead there must be a certain synchronization of the operations, and particularly in starting an underground tunnel, when it is in a cut of that kind, that is what I mean when I say in part.

Q. There was no synchronization during the period of twenty days, approximately, that the work was held up from going underground, was there?

A. I am speaking of it in general from the time we started the excavation of the portal, the excavation for the building, up to and including the final completion of the building.

Q. I am speaking specifically with respect to the work in this case, the work was shut down from about August 3 to August 23, driving [1019] underground, getting started in the tunnel underground,

(Testimony of Stephen Davidson Bechtel.)

because your subcontractor, K. E. Parker, was in the way: that is a fact, is it not?

A. I would not say so. As I say, my recollection of dates and sequence of operations is not clear, is not specific, I could not recall particular dates.

Q. You have not a distinct recollection of the sequence? A. That is right.

Q. You would not say that was not true, that you were held up between August 3 and August 23 by reason of the fact that you ceased work while K. E. Parker Company had got the foundations in?

A. No, but the constant effort of the Six Companies of California was to bring about a condition of complete installation and operations to expedite the tunnel construction as far as possible at all times, and that had to be synchronized and correlated with the other parts of the work, approach excavation, the construction of the portal building, and other operations.

The Court: Were you familiar with this work during this period? A. Yes.

Q. Was there any delay in that period?

A. Yes, there was delay.

Q. What was that delay caused by?

A. By the nature of the work.

Q. His question indicates that you sublet the contract to the approaches up to the face of the tunnel, is that correct? A. It is.

(Testimony of Stephen Davidson Bechtel.)

Q. In that event there were subcontractors there?

A. Yes.

Q. And delay caused in the tunnel? A. Yes.

Q. Counsel is trying to check the delay of 20 days, are you familiar with that? A. No.

Q. What were you doing during that time?

A. I was there from time to time; I do not recall the sequence of events.

Q. You have no recollection of it, at all?

A. Not of the dates. [1020]

Q. They have here a schedule of the progress of the work, are you familiar with that?

A. I recall their schedule.

Q. I suppose it is not only their schedule, but both sides.

Mr. Tinning: That is a schedule submitted by the Six Companies of California, the plaintiff in this case, on the 9th of August, 1934.

The Court: I am anxious to make headway. I have seen too much going on—if this case is going to be presented on the merits you had better get to the question at issue. You were there on the work, what was th situation?

A. Well, you say I was on the work. I was President of the Six Companies, I was there occasionally, several times a week, practically, throughout the entire construction.

Q. You were familiar with your own records, weren't you? A. Yes.

The Court: What is this record?

(Testimony of Stephen Davidson Bechtel.)

Mr. Tinning: That is a proposed schedule. Mr. Larson testified that they were shut down from the 3rd of August to the 23rd of August because of interference with the work of K. E. Parker, and that they did no tunnel driving during that period.

The Court: What is your knowledge?

A. There was interference with the tunnel construction, that is correct.

Q. Who was it caused it?

A. Partly K. E. Parker, and partly McKinley & Crowell, and partly our own operations.

Q. Was that the interference that caused the delay in the bore of that tunnel? A. Yes.

Q. What delay did it cause?

A. Mr. Tinning said it was a period of approximately 20 days.

Q. I am not concerned with what he said. I want your knowledge. You are the witness on the stand now. What is your knowledge?

A. I have no clear recollection of the delay involved there. [1021]

Mr. Tinning: Q. I show you a letter dated September 25, 1934, from Six Companies of California to Mr. Wallace B. Boggs, District Engineer, which I propose to offer in evidence under the understanding that we will produce copies subject to check.

Mr. Marrin: No objection.

Mr. Tinning: If your Honor please, we offer in evidence on behalf of Defendant a letter dated Sep-

(Testimony of Stephen Davidson Bechtel.)

tember 25, 1934, addressed by Six Companies of California to Wallace B. Boggs, District Engineer, Joint Highway District No. 13, Oakland, California, and ask that the same be received in evidence as Defendant's Exhibit next in order.

The Court: It may be admitted and marked.

(The letter was marked

"DEFENDANT'S EXHIBIT R.")

Mr. Tinning: I will read the letter. It is dated September 25, 1934.

"Mr. Wallace B. Boggs, District Engineer,
Joint Highway District No. 13,
Oakland, California.

"Dear Mr. Boggs:

"In the future in addressing communications to our field office with reference to the Broadway Tunnel Project, please mark them for the attention of Mr. T. M. Price, who assumed the position of Project Manager on September 20.

"Mr. W. R. Fontaine has assumed an advisory relationship in connection with the job.

"Yours very truly,
SIX COMPANIES OF
CALIFORNIA,
(Signed) S. D. BECHTEL,
President."

(Testimony of Stephen Davidson Bechtel.)

Q. Mr. Bechtel, directing your attention to the way in which the work was set up prior to September 20, 1934, following your taking the contract, it is a fact, is it not, that a railroad was constructed from the west portal down grade approximately 2500 feet along the right of way of the District from the point approximately [1022] I am pointing to on this diagram, which, as near as I can estimate, is approximately the 2500 feet that I have spoken of.

A. No. I do say that there was a dinkey track, a narrow gauge track, constructed on a down hill grade, but I do not think it is 2500 feet.

Q. Is it true that it was approximately from station 111 west to station 85?

A. I do not think it went that far.

Q. That would be subject to check with the records?

A. It may have been.

Q. It is your impression it was not quite as long as that? A. Yes.

Q. That railroad was designed to convey the tunnel muck from the mouth of the tunnel down grade and deposit it in the fill, in the highway fill, or in the dump, if it was not required for the highway fill?

A. That was the method for the purpose of transporting it down and putting it in the highway fill; I do not believe that was constructed for the dump operation.

(Testimony of Stephen Davidson Bechtel.)

Q. At any rate, it was to dispose of the material which was taken out of the tunnel?

A. Yes.

Q. There were a couple of trestles built on this railroad track, were there not, across the ravines?

A. I remember one ravine.

Q. You remember one? A. Yes.

Q. The there were some diesel locomotives supplied for this railroad? A. There was one.

Q. One Diesel and one gas?

A. There was one Diesel and one small gasoline; the gas locomotive was used to switch the cars in the tunnel face.

Q. That railroad caused considerable difficulty in operation, did it not, the trains and locomotive ran off the tracks, going down the grade?

A. I remember of that having happened a number of times.

Q. After Mr. Price came on the job he immediately began preparation [1023] for the construction of a muck bunker near the west portal and the elimination of the railroad from the west portal down to the point where it had formerly been operated?

A. The date of that I do not recall, but it was done in the forepart of the job.

Q. What is that?

A. That was done in the forepart of the job.

Q. It is a fact that it started immediately after Mr. Price got on the job? A. I do not recall.

(Testimony of Stephen Davidson Bechtel.)

Q. And that by October the method of transporting muck, or the middle of October the method of transporting muck had been changed and the material from the tunnel was hauled out of the tunnel to a point 200 or 300 feet west of the tunnel portal by the locomotives, and there dumped into a bunker, which was placed higher than the tunnel grade, and from that bunker put into trucks and carried down and put into the right of way?

A. Yes, I believe that was done, because of the different kind of material that was encountered, it was a different material than was anticipated, a different material than we originally contemplated, and furthermore, I believe that the fill at the point under the trestle you referred to was completed.

Q. Those fills were completed by the open cut subcontractor, were they not?

A. No, I do not think so. I think some tunnel muck was delivered into that.

Q. Isn't it a fact that through the month of October the only tunnel excavation that had been done was the removal of the muck or dirt from the drifts in approximately 92 feet in the south tunnel and approximately 110 feet in the north tunnel, and that the cores, the bulk of the excavation from these bores of the tunnel was not removed until after December 1, 1934?

A. I think that is correct, Mr. Tinning. If my recollection is correct there was a certain portion of the tunnel which was constructed by an open

(Testimony of Stephen Davidson Bechtel.)

cut [1024] excavation in the case of the portal building, a small distance away from the face, and there was some feet of construction between the portal building and the point they went underground.

Q. Perhaps we understand each other. It is your impression in October that that material was removed and hauled down the highway by this railroad?

A. No, that is not correct. The material that was hauled down by this railroad was material from the drift, I presume, that is my recollection.

Q. The matter of whether or not some other material was taken out of this open cut does not have to do with the matter I am discussing. I am discussing the use of the railroad, and it is a fact, is it not, that it was only used to haul the dirt that came out of the drift and that no other dirt was taken out of the excavated or driven portions of the tunnel except that dirt that came out of the drifts say in this first 100 feet in each tunnel, prior to the 1st of December, 1934?

A. I presume that is correct.

Q. And the muck bunker was used in the operation in the latter part of October, 1934 and the railroad was abandoned?

A. I don't recall the date.

Q. There was considerable time lost during the excavation of those drifts because the railroad was tied up and could not move that muck out?

(Testimony of Stephen Davidson Bechtel.)

A. I do not think so.

Q. You do not think so? A. No.

Q. Mr. Bechtel, I am going to show you a letter dated September 28, 1934, from Six Companies of California—this is a copy which, under the understanding we have had here, we wish to introduce, and we now offer in evidence a letter dated September 28, 1934, from Six Companies of California, addressed to Joint Highway District No. 13, which reads as follows:

[Set forth in the Book of Exhibits at page 371.]

[1025]

We offer the letter and attached documents in evidence as Defendant's Exhibit S.

The Court: They may be admitted and marked.

(The documents were marked "Defendant's Exhibit S.")

Mr. Tinning: Q. Will you examine the copy of this exhibit which I hand you, Mr. Bechtel, and which shows instead of 40 feet proposed operation going underground as Mr. Larson testified, 100 feet is proposed to go underground, that is true, is it not?

A. I might say, Mr. Tinning, I have never seen this before.

Q. Will you look at it and state whether my statement as to this diagram of the tunnel is correct? Will you look at the bottom of the page, and see if the original tunnel operation is 100 feet?

A. Plus or minus.

(Testimony of Stephen Davidson Bechtel.)

Q. Plus or minus? A. Yes.

Q. In other words, whatever distance was necessary within 100 [1026] feet? A. Yes.

Q. That is correct, is it not? A. Yes.

Q. It is a fact, is it not, Mr. Bechtel, that at this time Six Companies made no objection in writing to the fact that the distance which was necessary to operate under the procedure shown by this diagram was in excess of 40 feet?

A. I presume that is correct.

Q. You don't know of any objection, do you?

A. I don't know of any objection.

Q. You were president of the company?

A. Yes.

Q. Was any claim in writing made to the District for 60 feet of extra work or cost shown on this diagram?

A. None that I know of at this time.

Mr. Tinning: I will now offer in evidence a letter in copy form addressed by Six Companies of California over the signature of S. D. Bechtel, President, on the 18th of October, 1934, to Hon. T. A. Reardon, Director of the Department of Industrial Relations, State Building, San Francisco, California. I now offer this letter in evidence as Defendant's Exhibit in proper order.

The Court: It will be admitted and marked.

(The letter was marked "Defendant's Exhibit T.")

Mr. Tinning: I will read it. It is dated October 18, 1934. [1027]

(Testimony of Stephen Davidson Bechtel.)

DEFENDANT'S EXHIBIT T.

October 18th, 1934

Honorable T. A. Reardon,
Director of the Department
of Industrial Relations,
State Building,
San Francisco, California.

Dear Sir:

We are now engaged in the performance of our contract with Joint Highway District No. 13 of the State of California for the construction of the project, including highway, highway tunnel and approaches, with appurtenant structures, commonly referred to as the Broadway Low Level Tunnel. We respectfully request that you examine said Project and determine, as to that portion hereinafter referred to, that the application of the provisions of Section 653c-1 of the Penal Code is impracticable.

This request is not intended to apply to the entire project, but only to that part having to do with the tunnel proper, including, however, certain operations incidental to the construction of the tunnel which are carried on outside the tunnel and at the portals. These outside operations involve certain plant facilities, such as compressors, electrical shop, concrete mixing plant, carpenter shop, and tunnel muck dis-

(Testimony of Stephen Davidson Bechtel.)

posal work. In this connection we desire to point out that the work on the portion of the project which we have referred to covers only about 50% of the work on the entire project and that no request is made as to the balance.

We request that as to the portion of the project which we have described above, we be permitted to operate on a 48-hour week in lieu of a 30-hour week. In making this request we desire to point out that the only matter involved here is the question of the hours of labor and that the wage scale provided for in our contract with the District will be fully complied with.

In support of this request, we desire to submit the following facts to you:

In carrying out our contract with the District it will be necessary for us to construct two twin bores, each approximately 3,000 feet in length and 36 feet in diameter. While a project of this size does not permit an accurate analysis or forecast as to the type and formation of the ground through which the tunnels are to be constructed, it has now become apparent, and our engineers are of the opinion, that in the main the tunnels will not be constructed through hard rock but rather through comparatively soft earth and rock for a considerable distance. As a result of this condition, the hazards in connection with the construction of

(Testimony of Stephen Davidson Bechtel.)

the tunnels will be greatly increased. These hazards involve not only the safety of the project, but also the safety of all of the men employed in the performance of the work.

To this hazardous factor there must also be added an additional hazard due to the size of the tunnel. Experience has shown that as the dimensions of a tunnel increase, the hazards increase in a much greater proportion. Accordingly, considering the size of the tunnels and the type of material which we have encountered, it is our belief that the construction of the tunnels will be extremely hazardous.

Under these circumstances, it is essential that we have available at all times thoroughly competent and experienced men and that insofar as possible all conditions tending to increase the hazards be eliminated. In performing our work, therefore, we feel that we cannot use inexperienced men. Quite to the contrary, it is extremely important that we have a small number of crews the members of which are all experienced and skilled.

In connection with the number of crews, we desire to point out that the more frequent the changes in crews, the greater the hazards. Here, again, experience has shown that it is essential that tunnel construction work be as continuous as possible. While it is true that in certain types of work a frequent change of crews

(Testimony of Stephen Davidson Bechtel.)

tends to decrease the possibility of accidents, a contrary rule applies to tunnel work. The various operations in connection with the construction of a tunnel, involving drilling, shooting and mucking, can be carried on with best possible correlation and safety by the use of a limited number of crews working on at least an 8-hour basis. This is particularly true in soft ground tunnels where heavy timbering is required, for in such situations the use of a minimum number of shifts and men cannot help but diminish the possibility of a catastrophe to the tunnels and the workmen.

So far as an adequate supply of experienced men is concerned, we must point out that the fact that a tunnel is being constructed near a metropolitan area does not of itself lead to the conclusion that an adequate supply of competent workmen can be obtained. Experienced tunnel workers are of necessity a roving type of workmen, since they move about the country from project to project and are obtainable only from the various available tunnel labor markets. Consequently, it cannot be expected that even in cities of the size of Oakland or San Francisco any appreciable number of experienced tunnel men can be obtained, for the simple reason that this type of construction rarely occurs in this locality.

(Testimony of Stephen Davidson Bechtel.)

The condition of the tunnel labor market is further aggravated at the present time, so far as the Broadway Low Level Tunnel is concerned, because of the fact that several major tunnel construction jobs are now being performed on the Pacific Coast, and particularly in this State. It is to be noticed that a major project is now being carried out in the southern part of the State by the Metropolitan Water District. On this project the tunnel workers have been permitted to work 56 hours and due to this attraction to the workmen a great number of them have already been engaged in the performance of that job. The Fort Peck Project in Montana, on which the men are permitted to work in excess of 30 hours per week, has also drawn a considerable number of tunnel men from this region. Incidentally, it is our belief that most of the men who were engaged in the Hetch Hetchy work have already left this region and secured employment on the projects which we have mentioned. It is obvious that we cannot expect to obtain for our work men of experience and ability while we are restricted to a 30-hour week, when other similar projects are being carried on under conditions offering the men more attractive hours of labor, for the men naturally go to those projects where they can receive the greatest income.

The available supply of experienced labor has

(Testimony of Stephen Davidson Bechtel.)

been further diminished at the present time because of the revival of activity in the mining industry throughout the West. Due to this condition many experienced tunnel men have been removed from the available supply of labor in this State, and additional numbers will continue to engage in this industry because of the fact that they may obtain employment for a greater number of hours per week than is permitted on our project at the present time.

The situation confronting us in the employment of qualified labor for the construction of the tunnels is comparable to one of the situations as to which, under the Code of Fair Competition for the Construction Industry, a 48-hour week rather than a 40-hour week is permitted. In subdivision B, 1, (c) of Section 2 of Article III of that Code, it is provided that "on projects in localities where a sufficient amount of qualified labor is not available in the immediate vicinity of the work" an exception to the general code provision as to hours of labor may be made. In our work on the Broadway Low Level Tunnel we have encountered extreme difficulty in procuring a sufficient number of qualified and experienced tunnel men. The employment of inexperienced men increases the labor turnover, as a result of which the factors of safety are materially reduced

(Testimony of Stephen Davidson Bechtel.)

and the efficiency of the entire project is impaired.

On the basis of these facts, we request that you examine the Broadway Low Level Tunnel Project, determine that as to that portion to which we have referred the application of the provisions of Section 653c-1 is impracticable and that a 48-hour week be authorized for such work. We shall be glad to furnish any additional information that you require and to give you any assistance that may be necessary in order to permit a determination of this matter. Your early attention to this request is earnestly solicited.

Respectfully yours,
SIX COMPANIES OF
CALIFORNIA,

By

President.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's. Ex. T. Filed April 26, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

The Court: We will take a recess for a few minutes. [1032]

(After Recess)

Mr. Tinning: Q. Mr. Bechtel, when Six Companies of California bid on this work, you knew

(Testimony of Stephen Davidson Bechtel.)

that both the law of the State of California and the PWA regulations provided that the men who worked on the job could not work more than 30 hours per week? A. Yes.

Q. You also knew that all of the men who worked on the job had to come either through the National Reemployment Office or, if you desired to make the job 100 per cent Union, through the Unions? A. Yes.

Q. You also knew that, under the Union method of calling men, if the Unions in the region where the work was to be done could not supply men, you could call men anywhere in the United States and they could go to work on this job and join the Union? A. Yes.

Q. You selected, at the onset of your work, to take your men through the National Employment Office? A. Yes.

Q. And, with the kind that you selected, you encountered the difficulties which you refer to in your letter of October 18th, with respect to experienced men?

A. I think that was subsequently modified, Mr. Tinning, and men drawn through both sources.

Q. I am talking now of the October letter. You were drawing men through the National Reemployment Service at the time you wrote the letter on October 18, 1934, to Mr. Reardon, that has just gone into evidence; you were drawing all your men through the National Employment Office?

(Testimony of Stephen Davidson Bechtel.)

A. I think so.

Q. That was the method that you selected, yourself, when you started the work? A. Yes.

Q. At that time, and from the beginning of the work, you had authority to work on Saturdays, Sundays and other holidays, without the payment of overtime, upon a ruling that was obtained by the District from the PWA and the state?

A. Yes.

Q. The District helped to get that provision, or obtained that [1033] provision, before any work was started?

A. I am not clear on that point.

Q. Well, isn't it your recollection that it was announced—— A. It was a fact.

Q. Yes. When you wrote the letter of October 18, 1934, you were aware of the fact, as so stated in your letter, that in the main the tunnels would not be constructed through hard rock but through comparatively soft earth and rock for a considerable distance; you knew that when you letter that letter, didn't you? A. No.

Q. Didn't you so state in your letter?

A. I don't believe so.

Mr. Tinning: May I have Defendant's Exhibit "T," please?

The Witness: May I see it?

Mr. Tinning: Q. Yes; perhaps that would be better. Now, it is true, when you read the letter,—I think perhaps you did not understand my ques-

(Testimony of Stephen Davidson Bechtel.)

tion, Mr. Bechtel; you did not have that long letter in front of you —it is true that you stated, in that letter to Mr. Reardon:

"While a project of this size does not permit an accurate analysis or forecast as to the type and formation of the ground through which the tunnels are to be constructed, it has now become apparent, and our engineers are of the opinion, that in the main the tunnels will not be constructed through hard rock but rather through comparatively soft earth and rock for a considerable distance"?

You so stated in the letter to Mr. Reardon, and you knew that to be a fact, at that time, did you not? A. No.

Q. Well, you wrote the letter, didn't you?

A. Yes.

Q. You don't mean to say you stated something in a letter to Mr. Reardon which you did not know to be a fact?

A. I don't think it says that. Possibly, in connection with the letter, there is a little background to it and the events which followed, which are part of the [1034] purpose and part of the matters touched upon here.

Q. Well, Mr. Bechtel, I am drawing your attention to a specific instance, and I am asking you now if, at the time you wrote that letter to Mr. Reardon on October 18, 1934, it is not a fact that you made the statement which appears in the paragraph which commences at the bottom of the page of the

(Testimony of Stephen Davidson Bechtel.)

copy that you hold,—page one,—and goes on to page two, in that same paragraph.

A. Well, Mr. Tinning——

Q. Will you answer me "Yes" or "No," whether the statements you made—the statement that appears there——

A. Well, it is apparent that I made the statement; it is in the letter.

Q. Was the statement true or not true?

A. I guess I am confused as to just what you mean, Mr. Tinning.

Mr. Tinning: Will you read the question, please?

(Record read)

The Witness: A. It was.

Mr. Tinning: Q. Will you answer it "Yes" or "No," Mr. Bechtel, and then explain?

A. You mean is it true what was written?

Q. Is the statement, in the paragraph referred to, true or not true?

A. The statement in the letter, as it appeared at that time, and based upon the background of this letter, is true.

Q. So, you knew, at that time, on October 18, 1934, that in the main the tunnels would not be constructed through hard rock but would be constructed through comparatively soft earth and rock for a considerable distance?

A. I don't think that that is what is intended by the letter.

(Testimony of Stephen Davidson Bechtel.)

Q. Well, did you know it or did you not know it? A. I did not know it.

Q. You did not know it? Then, although you wrote the letter of October 18th to Mr. Reardon, you did not know the conditions which you stated there were true?

A. This letter grew out of discussions——

[1035]

Q. Will you answer "Yes" or "No," Mr. Bechtel, and then explain?

A. Will you repeat the question, please?

Mr. Tinning: Will you read the question, please?

(Question read)

The Witness: A. It doesn't say that they are true, Mr. Tinning.

Mr. Tinning: Q. I am asking you whether you made the statements that were made in that letter.

A. Yes, I did.

Q. Did you or did you not know them to be true at the time you made them?

A. I thought what I was endeavoring to say here was correct.

Q. And that was your understanding at the time you wrote the letter? A. Yes.

Q. Thank you. When you wrote the letter of October 18th to Mr. Reardon, you knew that a project of the size of the Broadway Low Level Tunnels did not permit of an accurate analysis or forecast as to the type and formation of the ground through which the tunnels were to be constructed?

A. Yes.

(Testimony of Stephen Davidson Bechtel.)

Q. That was also in your mind at that time?

A. Yes; an exact analysis cannot be made.

Q. An accurate analysis cannot be made?

A. I say an exact analysis and accurate.

Q. At the time you wrote the letter, you also knew that, due to the size of the tunnels and the ground to be encountered, heavy timbering would be required? A. No.

Q. Didn't you so state in the letter?

A. Let me see the letter.

Q. Next to the last paragraph on page two of the copy you hold. Will you please look at the last sentence? You wrote that last sentence, did you not? A. Yes; that is right.

Q. Put it in the letter? A. Yes.

Q. It reads: [1036]

> "This is particularly true in soft ground tunnels where heavy timbering is required, for in such situations the use of a minimum number of shifts and men cannot help but diminish the possibility of a catastrophe to the tunnels and the workmen."

When you wrote that sentence, you knew that heavy timbering would be required in this tunnel, did you not?

A. That some would be required and was being used.

Q. That some heavy timbering would be required? A. Was being used.

(Testimony of Stephen Davidson Bechtel.)

Q. On October 18th, you were just going underground, weren't you? A. That is correct.

Q. That was the heavy timbering that you referred to at that time?

A. Yes; but, Mr. Tinning, when this letter was written, we had hoped that the tunnel ground would be improved and we would find the better tunnel ground which we had understood we were to find, and that we had planned on; and that same opinion continued for a long time thereafter; and this letter was written for the purpose of procuring permission to have our labor situation on what was comparable with other jobs being constructed in this general territory,—Southern California, Sierra Nevadas, and in Northern California; and it was written for that purpose and was written after discussions with Mr. Reardon, after discussions, as I understand it, with the Highway Department, with Mr. Wallace Boggs; and this letter incorporated the thoughts and suggestions of a number of men as to the reasons why this should be granted, incorporating, as I say, the thoughts of a number of these men,—the suggestions which they had made,—and with the purpose in mind, and the only purpose in mind, of this letter, was to procure the acception or the approval of the Industrial Accident Commission of the State of California, the Joint Highway District and the other bodies that were involved,—permission to employ the men longer

(Testimony of Stephen Davidson Bechtel.)

periods of time; that was the reason stated in the letter, and for that purpose alone. [1037]

Q. Mr. Bechtel, is there any statement in this letter which is untrue?

A. Not to my knowledge.

Q. Was there any statement made in the letter which you knew was untrue at the time that you wrote it?

A. No. I think that would be obvious; I would not sign it, if I did not think it was correct, from the information I had at the time—the thought I had at the time.

Q. When you wrote the letter, there was no statement made in it which you did not believe to be true? A. That is correct.

Mr. Tinning: We will offer in evidence, if the Court please, a letter dated November 27, 1934, addressed to "Board of Directors, Joint Highway District No. 13 of the State of California," by "Six Companies of California," signed by "S. D. Bechtel, President," and ask it be marked in proper order.

(The letter was marked "Defendant's Exhibit U.")

Mr. Tinning: Gentlemen, this letter is very much the same as the one of October 18th, and I would like to read portions of it into the record which we consider are admissions and not read the rest of the letter, because it is long. If you desire the letter read——

Mr. Smith: I don't think that is a fair way to read a document or anything that is contained in the document——

Mr. Tinning. Very well; we will read it, Mr. Smith: [1038]

DEFENDANT'S EXHIBIT U.

Builders of Low Level Broadway Tunnel
Six Companies of California
155 Sansome Street
San Francisco, Calif.

November 27th, 1934.

Board of Directors,
Joint Highway District No. 13
of the State of California,
1448 Webster Street, Oakland, California.

Gentlemen:

As you are aware, the work of constructing the Broadway Low Level Tunnel has been closed down by us. We closed this work down for several reasons, the principal one, however, being our inability to procure competent labor for the construction of the tunnels under the existing restrictions in our contract and the regulations surrounding the employment of labor.

Our inability to secure competent labor for the tunnel work arises out of the following conditions:

(Testimony of Stephen Davidson Bechtel.)

The location in which this work is being done, while comparatively close to populous communities, is isolated from any adequate supply of labor of the type required for the construction of tunnels, particularly tunnels through soft ground and of the size being constructed under this contract. It is essential that the timbering and blasting operations as well as the other work in such tunnels be done by men experienced in this kind of work. This kind of work requires experienced miners. The laborers available in the District are not miners. They are mostly farmers, small home owners, and other kinds of ordinary laborers.

One of the principal reasons for this situation arises from the fact that extensive tunnel work is being carried on in Southern California at the present time under regulations permitting the men to work sixty per cent more hours and earn fifty per cent more money at a less rate per hour of pay than on the Broadway Tunnel Work. It is also a fact that a large amount of the Southern California tunnel work is being carried on near populous communities and that nevertheless these rigid restrictions have been modified so far as that work is concerned. Men experienced in tunnel work will not accept employment with us when, by going to Southern California, they can earn substantially more money. Furthermore, the laborer

(Testimony of Stephen Davidson Bechtel.)

who works in tunnels ordinarily moves from one job to another and is not permanently located in any community.

We submit that it is inequitable and unfair to permit other work of a similar nature to be carried on under more favorable conditions in Southern California when such other work is in direct competition with us for the available supply of labor.

The construction of this tunnel, because of its size and the nature of the ground, is a dangerous operation. It is impossible to give minute supervision to the details of the work which each man is doing and, in the interests of the protection of human life, it is essential that competent men be placed on the work. Improper timbering, blasting, and other operations required will, unless the work is properly done, inevitably endanger the lives of all of the men working in the tunnels. In view of the fact that the present regulations applicable to this job will necessarily, if not modified, require us to construct the tunnel with incompetent employees, we hereby protest against reopening the work until the present restrictions are modified so that the hazard to the men can be eliminated.

We believe that the only other tunnel now being constructed which is on a thirty hour a week basis is the tunnel through Yerba Buena

(Testimony of Stephen Davidson Bechtel.)

Island. The work on this tunnel is not comparable with the work on the Broadway Tunnel. The Yerba Buena tunnel is a short tunnel through hard rock and does not involve the hazards which will necessarily be encountered in constructing the Broadway Tunnel. Furthermore, the time schedule is such that the operations on the Yerba Buena tunnel are not required to be carried on at the same rate of speed as on the Broadway Tunnel. Also, the contractor on the Yerba Buena tunnel is not working under the same regulations and has complete freedom in the selection of his men.

We are satisfied that if the present regulations were modified to permit a working week of forty-eight hours on the tunnel operations the foregoing unsatisfactory and dangerous conditions could be eliminated. This work would then be placed on a basis where we could offer the men an opportunity to make comparatively the same wages that they do on other work of a similar nature in Southern California, and we feel that this would enable us to secure sufficient competent men to do the work promptly and efficiently and without any unnecessary hazard.

May we, therefore, ask that you take the appropriate steps to secure a modification of the present regulations so as to permit the tunnel operations to be carried on on the basis of a

(Testimony of Stephen Davidson Bechtel.)

forty-eight hour week before work on this project is resumed.

Very truly yours,
SIX COMPANIES OF
CALIFORNIA,
By (Signed) S. D. BECHTEL
President.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's. Ex. No. U. Filed April 26, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

Mr. Tinning: If the Court please, we offer in evidence a letter dated December 1, 1934, addressed to "Board of Directors, Joint Highway District No. 13," by "Six Companies of California," signed by "S. D. Bechtel, President"; and ask that the same be marked as a defendant's exhibit.

(The letter was marked "Defendant's Exhibit V.")

Mr. Tinning: (Reading): [1041]

(Testimony of Stephen Davidson Bechtel.)

DEFENDANT'S EXHIBIT V.

Builders of Low Level Broadway Tunnel
SIX COMPANIES OF CALIFORNIA
Field Office Post Office Box 120
Berkeley, California

December 1, 1934

Board of Directors
Joint Highway District No. 13
of the State of California,
1448 Webster St.,
Oakland, California.

Gentlemen:

As you are aware, the work of constructing the Broadway Low Level Tunnel has been closed down by us. We closed this work down for several reasons, the principal one, however, being our inability to procure competent labor for the construction of the tunnels under the existing restrictions in our contract and the regulations surrounding the employment of labor.

In our preliminary operations of going underground, we have obtained from the N. R. S. Bureau 230 men for tunnel work. Of this number, we have made the following disposition:

(Testimony of Stephen Davidson Bechtel.)

Quit, have better jobs	47
Discharged, totally unfit	30
Reduced from miners to muckers, because of qualifications	24
Discharged, non-citizen	5
Discharged, medical rejection	26
Deceased	1
Total number remaining on call	97
	230

Of the 97 indicated above, who are technically on call, we estimate there are approximately 30 who by their work have indicated that they are fair tunnel men. As only 200 tunnel men, in addition to the above, are registered at the N. R. S., we do not believe that we would be able to secure any greater percentage of satisfactory tunnel men from these remaining men than that which we have experienced above.

Our inability to secure competent labor for the tunnel work arises out of the following conditions:

The location in which this work is being done, while comparatively close to populous communities, is isolated from any adequate supply of labor of the type required for the construction of tunnels, particularly tunnels through soft ground and of the size being constructed under this contract. It is essential that the timbering and blasting operations as well

(Testimony of Stephen Davidson Bechtel.)

as the other work in such tunnels be done by men experienced in this kind of work. This kind of work requires experienced tunnel men. The laborers available in the District are not tunnel men. They are mostly farmers, small home owners, and other kinds of ordinary laborers.

One of the principal reasons for this situation arises from the fact that ninety (90) miles of tunnel work is being carried on in Southern California at the present time under regulations permitting the men to work sixty percent more hours and earn fifty percent more money at a less rate per hour of pay than on the Broadway Tunnel work. It is also a fact that a large amount of the Southern California tunnel work is being carried on near populous communities and that nevertheless these rigid restrictions have been modified so far as that work is concerned. Men experienced in tunnel work will not accept employment with us when, by going to Southern California, they can earn substantially more money. Furthermore, the laborer who works in tunnels ordinarily moves from one job to another and is not permanently located in any community. Also many miners are going into mining work due to the large development now underway in that field.

We submit that it is inequitable and unfair to permit other work of a similar nature to be carried on under more favorable conditions in

(Testimony of Stephen Davidson Bechtel.)

Southern California when such other work is in direct competition with us for the available supply of labor.

The construction of this tunnel, because of its size and the nature of the ground, is a dangerous operation. It is impossible to give minute supervision to the details of the work which each man is doing, and, in the interests of the protection of human life, it is essential that competent men be placed on the work. Improper timbering, blasting, and other operations required will, unless the work is properly done, inevitably endanger the lives of all of the men working in the tunnels. In view of the fact that the present regulations applicable to this job will necessarily, if not modified, require us to construct the tunnel with incompetent employees, we hereby protest against reopening the work until the present restrictions are modified so that the hazard to the men can be eliminated.

We believe that the only other tunnel now being constructed which is on a thirty hour a week basis is the tunnel through Yerba Buena Island. The work on this tunnel is not comparable with the work on the Broadway Tunnel. The Yerba Buena tunnel is a short tunnel through hard rock and does not involve the hazards which will necessarily be encountered in constructing the Broadway Tunnel. Furthermore, the time schedule is such that the

(Testimony of Stephen Davidson Bechtel.)

operations on the Yerba Buena tunnel are not required to be carried on at the same rate of speed as on the Broadway Tunnel. Also, the contractor on the Yerba Buena tunnel is not working under the same regulations and has complete freedom in the selection of his men.

We are satisfied that if the present regulations were modified to permit a working week of forty-eight hours on the tunnel operations, the foregoing unsatisfactory and dangerous conditions could be eliminated. This work would then be placed on a basis where we could offer the men an opportunity to make comparatively the same wages that they do on other work of a similar nature in Southern California, and we feel that this would enable us to secure sufficient competent men to do the work promptly and efficiently and without any unnecessary hazard.

A crew will be composed of the following men, with the respective rates shown:

Ten miners,	at	$0.75 per hour
Two nippers,	at	$0.60 per hour
Seven chuck tenders,	at	$0.60 per hour
Fifteen muckers,	at	$ .60 per hour
One shovel operator,	at	$1.25 per hour
One dinky operator,	at	.75 per hour
One powder man,	at	.75 per hour
Two pitmen,	at	.60 per hour
One brakeman,	at	.65 per hour
One tugger man,	at	1.25 per hour

(Testimony of Stephen Davidson Bechtel.)

This makes a total crew of forty-one (41) men. Practically all these men are trained in the various operations undertaken in a heading and are required to know safe practices in the different kinds of work performed underground, namely, drilling, blasting, timbering and mucking.

May we, therefore, ask that you take the appropriate steps to secure a modification of the present regulations so as to permit the tunnel operations to be carried on on the basis of a forty-eight hour week before work on this project is resumed? On the thirty hour week this would amount to 229 men affected; on a forty-eight hour week, 144 men would be affected.

Very truly yours,

SIX COMPANIES OF CALIFORNIA,

By (Signed) S. D. BECHTEL
President (T. M. P.)

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's. Ex. No. V. Filed April 26, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

[Endorsed]: Received Dec. 1, 1934. Joint Highway Dist. No. 13.

Mr. Tinning: Q. When you wrote this letter, you made a statement that the work was closed

(Testimony of Stephen Davidson Bechtel.)

down on the Broadway Tunnel by you. When you bid on this job, you knew the specifications required you to leave the concrete forms on the lining for a period of 21 days, which was required by the District Engineer?

Mr. Marrin: This letter appears to have been signed by someone else, on Mr. Bechtel's behalf,—"T. M. P."—apparently, Mr. Tom Price. I wonder if you would mind showing him the original, to see whether he actually signed it or not?

The Witness: Yes, that is signed by Mr. Tom Price, upon my authority.

Mr. Tinning: Q. Did you dictate the letter, or did Mr. Price?

A. I believe that Mr. Price did.

Q. However, the statement that appears at the first paragraph of this letter of December 1st is substantially the same as the statement that appears in the first paragraph of the letter which you did sign, yourself, which you wrote on November 27, 1934?

The Court: I think the witness indicated that he authorized the letter in question.

Mr. Tinning: Yes. [1045]

Q. Well, you knew, at the time you signed it, that the specifications in this matter gave the District Engineer the right to retain the concrete forms on the concrete lining 21 days, up to that time, did you not? A. Yes.

Q. It is a fact, is it not, the rings that were placed at the west portal of these tunnels were required by the District Engineer to remain with the

(Testimony of Stephen Davidson Bechtel.)

forms in place for 21 days after the concrete was poured? A. Yes, I think so.

Q. So that the work was shut down at the west portal of the tunnels primarily and apparently because you could not work driving further in while the forms were stulled in the core in each of those two portions of the tunnel; that is true, isn't it?

A. I presume so.

Q. So that, from about the 6th or 7th of November,—or the 14th of November, in the north bore, and the 6th or 7th, on the south bore, until the 5th or 6th of December, the work was shut down because you could not drive through the point where you had those forms supported against the stulls waiting for the concrete to season?

A. We could have, with the approval of the Engineer, apparently, Mr. Tinning.

Q. But you did not get that approval, did you?

A. I don't think so.

A. And the forms remained the 21 days?

A. As I recollect it.

Q. You say the work was shut down and the driving of those tunnels was shut down to permit the concrete to season in accordance with the provisions of the specifications and the conditions which you knew when you bid? A. That is right.

Q. That is right, isn't it?

A. I would think so.

The Court: We will take a recess until two o'clock this afternoon.

(Thereupon, an adjournment was taken until two o'clock p. m., this date.) [1046]

(Testimony of Stephen Davidson Bechtel.)

Afternoon Session,
Tuesday, April 26, 1938;
2 O'Clock P. M.

STEPHEN DAVIDSON BECHTEL,

Cross Examination (Continued)

Mr. Tinning: Q. Mr. Bechtel, so that it will be easier for you to answer the questions, I will hand you the letter that has been previously admitted in evidence as Defendant's Exhibit "V."

Mr. Bechtel, when you wrote that letter which is dated December 1, 1934, what did you have in mind when you wrote the sentence which appears as the first sentence of the fourth paragraph on the second page of that letter? So there will be no confusion, will you please turn to it? What did you mean when you wrote that sentence:

> "The construction of this tunnel, because of its size and the nature of the ground, is a dangerous operation——"

What did you mean by "the nature of the ground"?

A. Mr. Tinning, this was written over my signature, with my approval, but by Mr. Price, I believe.

Q. What did you mean when you approved it?

A. Well, I approved, to Mr. Price, the submission of this letter which I believe that he called me on the phone and asked me my approval for; and after he had discussed this matter with the Indus-

(Testimony of Stephen Davidson Bechtel.)

trial Accident Commission, I believe with Mr. Boggs, the PWA people and the National Reemployment people; and it, in substance, was the same as the previous discussions we had had, and was furthering the end of procuring or asking for the approval to work a 48 hour week.

Q. I understood that was the purpose of the letter; but what, in your mind, was the meaning of the words that you were using in seeking to get the permission, "and the nature of the ground"?

A. Well, the nature of this ground—that was probably referring [1047] to the fact that, at that time, we had constructed something like 90 feet in the north tunnel and 110 feet in the south tunnel. We knew that that ground was difficult,—more difficult than we had anticipated; we knew it was very difficult ground, and we hoped we would have better ground, but we were not sure but what we would have continued bad ground; and, in referring to the nature of the ground here, I assume that that was what was involved.

Q. You did not say anything in this letter that you met any unanticipated conditions; you did not say anything about unanticipated conditions in this letter, did you? A. Apparently not.

Q. And you were referring not to the ground through which you had passed but the ground into which you intended to drive?

A. It was based upon the ground through which we had gone to that time, and it was anticipating a

(Testimony of Stephen Davidson Bechtel.)

ground condition that might or might not get better; we hoped it would get better, but we did not know whether we would get better ground, and we were preparing for the contingency where the bad ground would continue for some distance.

Q. And that was what you menat when you stated to Mr. Reardon, in your letter of October 18, 1934, that it was impossible to predict the ground you might encounter in a project of this size?

A. That is right, yes.

Q. All right. Will you proceed to the last sentence of that paragraph:

> "In view of the fact that the present regulations applicable to this job will necessarily, if not modified, require us to construct the tunnel with incompetent employees, we hereby protest against reopening the work until the present restrictions are modified so that the hazard to the men can be eliminated."

Why were you protesting to the District when you were dealing with the Industrial Accident Commission?

A. Well, this matter had been discussed with Mr. Boggs, because it was with the District [1048] that we had our contract. Our contract conditions were that we could not work over 30 hours per week at that time, and we were applying to Mr. Boggs, or the District; we were also applying to the Industrial Accident Commission, Mr. Reardon, because

(Testimony of Stephen Davidson Bechtel.)

we understood that that was the procedure that we should follow. We were so instructed to that effect by Mr. Boggs: that we should do it.

Q. As a matter of fact, your contract provisions and the provisions of the laws of the State of California and the United States PWA regulations would govern the hours of labor of men working on the work; that is true, isn't it. A. Yes.

Q. You have already stated you knew that when you estimated? A. Yes.

Q. When you bid. And it was necessary for you to apply to the Department of Industrial Relations under the then law, the provisions of Section 653C of the Penal Code for special permission to work men more than 30 hours per week on this type of work?

A. Substantially, yes; but I don't think—I did not intend to say at that time there was no state law which required you could not work over 30 hours a week; that was a contract provision. We were advised by you, or by Mr. Boggs, that we had to first get the approval of the Industrial Accident Commission, also the District, also the PWA, also the NRS; and the burden of the proof on the entire matter was put up to us, and we made the rounds not once but several times,—Mr. Price did, and myself,—on that subject.

Q. Mr. Bechtel, referring again to your letter of October 18, 1934, which you have got before you, I want to call to your attention that, at the end of the

(Testimony of Stephen Davidson Bechtel.)

first paragraph, you made your first application under the provisions of Section 653C1 of the Penal Code, which was the statute,—an emergency statute,—in effect at the time the contract was let, as up to that year; thereafter, until the [1049] Legislature met in 1935, it limited the work on all public projects to 30 hours per week unless you got a waiver from the Department of Industrial Relations. You have just told me that you thought it was a contract provision. It was a provision of law which you referred to in your letter?

A. Well, we applied to both, Mr. Tinning, endeavoring to get their approval. I understood we had to get the approval of the Industrial Accident Commission, likewise that of Joint Highway District No. 13; and we were somewhat guided by the advice and views and directions we got from Mr. Boggs and from Mr. Reardon's office, and all parties that were involved.

Q. Well, you had attorneys, didn't you?

A. Yes.

Q. And they assisted you in the preparation of this application? A. Yes.

Q. They saw your letters?

A. Undoubtedly they did.

Q. Why were you protesting to the District when it was a matter for Mr. Reardon of the Division of Industrial Relations?

A. Well, this is directed to Joint Highway District No. 13.

(Testimony of Stephen Davidson Bechtel.)

Q. Yes. I am asking why you were protesting to us about something that was in your contract.

A. To get your approval and get your support to a proposition which we thought was favorable to the work, and we were doing everything possible.

Q. And you assumed you could get our support by protesting?

A. Well, I would gather that must have been in our minds. I cannot recall the reason why we used certain words, but that was our purpose: to get your support or get your approval, or both.

Q. Following the filing of the letter with the Industrial Accident Commission, you testified, at a hearing—let me withdraw that question. Following the filing of the letter with the Department of Industrial Relations of the State of California, Mr. Bechtel, you testified, at a hearing before Mr. Reardon, the Director of the [1050] Department, on the 4th day of December, 1934—do you remember that hearing in Mr. Reardon's office?

A. I remember a hearing there; but I don't remember the date.

Q. Do you remember that Mr. Reardon, the Director of the Department, was there; Mr. Frank Burke, Secretary; there was a court reporter; Mr. Boggs and myself were there; Colonel Skaggs, Division Engineer of the State Highway Commission, was present; and L. M. Larson, T. M. Price, T. D. Ferneau,—who was a state inspector, I believe; and they were present at that time?

(Testimony of Stephen Davidson Bechtel.)

A. I don't remember each one of those being present.

Q. Do you remember, at that hearing, you appeared there for the application that was initiated by your letter of the 18th of October and had been followed by letters to the Department, dated the 27th of November and the 1st of December?

A. Yes.

Q. Which we have already introduced. I will ask you if, at that time and at that hearing and pursuant to the application which Six Companies of California was making for a change in the 30 hour work rule—if you made this statement at that hearing:

> "The condition would be substantially improved over that which now exists. If we could cooperate with the National Reemployment Service in the selection of men, or picking, judging ability of the men, even then we would have difficulty in holding experienced men on this job and work them only 30 hours per week. The earnings on the job are not attractive. On account of the large tunnel work done in Southern California, Parker Dam, Boulder Dam, and the mining industry. Mining all over the western country is drawing upon experienced miners constantly. However, it would be of substantial benefit and help in solving this problem if we could find some modification or other prac-

(Testimony of Stephen Davidson Bechtel.)

ticable application of employment through the National Reemployment Agency." [1051]

Do you remember that?

A. I don't remember the particular phrasing you speak of; but I remember being there, and I remember my testifying, Mr. Tinning.

Q. Do you remember giving the further statement:

"We understand that there are approximately 200 men registered as miners. Our experience, I can state from actual statistics we have kept of same, and if the ratio would continue, we would get between 25 and 30 tunnelmen out of the ones reported to be available provided the 30 hour per week would continue. I would like to comment on this thing. These tunnels are being constructed through the Coast Range Mountains. Experience over 40 years indicates that the Coast Range in every instance presents dangers and difficulties. We have records of bad tunnels. The San Pablo Tunnel was constructed for the East Bay Water Company 15 years ago and in one accident eight lives were lost. The Claremont Tunnel is within a mile or so of this tunnel. Different conditions develop on both ends of tunnels 3 miles long. There is very wet swelling ground and difficult ground. The Sacramento Northern Tunnel presented a number of difficult conditions. The Northern

(Testimony of Stephen Davidson Bechtel.)

Pacific Tunnel through Niles Canyon in the Coast Range Mountains was extremely difficult."

I think, by that, you were referring to the Western Pacific; possibly the reporter made a mistake?

A. Probably so.

Q. "It took twice as long to construct than contemplated. In the Hetch Hetchy Tunnel, as you know, there was swelling and difficult hazardous ground was experienced there. Through those same mountains we have to construct this tunnel. In the Coast Range you get a different formation—no continuity. You have to have versatile crews and high type men. We have that in the selection of the crew and the men on the job. Of six contractors who constitute the Six [1052] Companies of California we have good men. The superintendent or foreman has to have experienced tunnel crews. All the men can do any part of the work themselves. Our experience indicates that of the men we have gotten, there is not over a small percentage of them qualified to work in a tunnel of that kind if that tunnel is to be constructed without serious accidents. Relief can come in two forms: First, the lengthening of hours of permissible work for underground men from 30 hours maximum to 40 hours maximum; Second, and partial solution of this will be a modification or cooperative

(Testimony of Stephen Davidson Bechtel.)

understanding having to do with the selection or procuring of men so that experienced tunnelmen could be procured for this work. The present condition of 30 hours per week and non-selectivity of men make it extremely slow to get ahead with a tunnel of this kind. We have to have expreienced men so that the work is done by them as a team and without it difficulties develop. They have developed. We hope to minimize that as time goes on and in cooperation of 40 hours per week and selectivity by the National Reemployment Service of the men we hope to protect the safety of the tunnel and the men."

Do you remember making that statement at that time, Mr. Bechtel?

A. Yes; and I believe it is a very pertinent point, Mr. Tinning, because, in there, I observed, in the Coast Range Mountains there are bad tunnel grounds, there are also good tunnel grounds. I speak there about the two ends of a tunnel,—whether 3 miles apart or 3000 feet apart; they may be different; and that was the case in many of these tunnels. In many of these tunnels referred to, there were portions of them that were very good ground; other portions were very bad ground. It doesn't take very much bad ground in a tunnel to make it a very difficult situation,—a very slow situation. When the first of these letters was written, on October 18,

(Testimony of Stephen Davidson Bechtel.)

1934, we had [1053] completed the bottom drifts of two tunnels,—both the north and south tunnels; and we knew what was encountered in those 100 feet, approximately; and we knew there what we were going to get into, or what was anticipated. We had anticipated good ground; and, up to that point, we had been wrong. We did not know how much further we were going to be wrong. We hoped for better ground; and this letter here, I think, is very pertinent. I think it explains my thought at that time. I would, today, give you the thought that different ends of the same tunnel, of tunnels through the same range—different tunnels in the same territory and the same state, vary substantially; and all a contractor can do is use the best judgment on the information furnished him to make his bid; and that is what we did in this case; we used the information that was called to our attention; we used the information given us by Dr. Louderback, the information which you called to our attention, and we made our caluculations—our assumptions, from that. We found that it was different. When we got to this point here, we had gone in 100 feet and were looking to make more progress and to enter further into the spirit of finishing this job quickly and with a maximum effort and minimum cost, by asking your cooperation and the Industrial Accident Commission for a 48 hour week, then; and then, on the advice of the PWA, of the National Reemployment Service, or Mr. Boggs or a group of people—it was reduced

(Testimony of Stephen Davidson Bechtel.)

to ask for 40 hours a week, which was prevailing in the state somewhat generally at the time; and was subsequently approved.

Q. Mr. Bechtel, Mr. Boggs had nothing to do with the granting of permission for a 48 hour week or a 40 hour week, did he? It was a matter for Mr. Reardon and the PWA authorities and the District Directors?

A. Yes. However, it was not only necessary to secure these approvals referred to, but also to have the approval of the Joint Highway District No. 13 and the District [1054] Engineer,—Mr. Boggs; so it was to that end that we were working in this instance.

Q. You had his full assistance, and full assistance of the District, in getting the 40 hour week, did you not?

A. Mr. Boggs said he could not do anything more than passing it on; that he would not object to it; but, more directly, I think we did have his assistance, or we certainly did not have any objection on his part.

Q. All his assistance and the District's cooperation? A. Yes.

Q. You stated, in your testimony to the Department of Industrial Relations, that "experience over 40 years indicates that the Coast Range in every instance presents dangers and difficulties"? You knew that when you bid, did you not?

(Testimony of Stephen Davidson Bechtel.)

A. No; I think that that is either a misstatement or a matter that was made in conversation. It is not exactly correct, Mr. Tinning. If it was said—if I said it, why, I should probably have corrected it immediately thereafter, because I don't think it is a correct statement.

Q. Let me see if I understand, Mr. Bechtel. Do I understand you to say you did not make the statement on December 4, 1934?

A. I wouldn't say that. I wouldn't say I did not make it.

Q. Mr. Bechtel, I am reading from a certified copy of the transcript of the hearing, that is certified by Gertrude Maloney, the reporter who took the testimony at that hearing, and I have been reading to you, Mr. Bechtel, the examination—the first question was on page 7 of the transcript, and I have been reading now the sentence that appears in the top of page 8. Now, as I understand you, you don't question the accuracy of the report; but you say you did not mean to say what you said there; is that it?

A. That may be it.

Q. Well, what is it?

A. Well, that the exact statement there was made in a matter of a general discussion before a Commission, at which we were having a general discussion of the entire problems [1055] involved. We were discussing tunnels generally, and, if I said that, I don't think that is what I intended to say.

Q. You don't deny you did say it?

(Testimony of Stephen Davidson Bechtel.)

A. I may have probably said it. If the recorder says I said it, I probably said it.

Q. "Experience over 40 years indicates that the Coast Range in every instance presents dangers and difficulties"?

A. If I said it, I was in error.

Q. "We have records of bad tunnels"? Did you say that?

A. If the recorder says I did, I probably did.

Q. "The San Pablo Tunnel was constructed for the East Bay Water Company 15 years ago and in one accident eight lives were lost——"

A. I understood that was correct.

Q. You knew that when you bid on this work, did you? A. I probably did.

Q. "The Claremont Tunnel is within a mile or so of this tunnel"? You knew that when you bid on this work? A. Yes.

Q. You employed Mr. Larson to make the estimate for you, and he had worked on the Claremont Tunnel? A. Correct.

Q. You knew that when you employed him?

A. Yes.

Q. That was one of the reasons that you employed him, wasn't it? A. One of them.

Q. He knew the conditions to be encountered on your estimate; that was true?

A. Well, he knew what his experience had indicated. Having known he went there and was there for a long period, and his familiarity with condi-

(Testimony of Stephen Davidson Bechtel.)

tions generally around the Bay, and this tunnel construction generally, we employed him.

Q. His experience that you employed for the purpose of preparing this estimate was a part of the experience of over 40 years that indicated that the Coast Range in every instance presents dangers and difficulties?

A. I referred to the Claremont Tunnel there, and did employ Mr. Larson. [1056]

Q. "Different conditions develop on both ends of tunnels 3 miles long"? That was with reference to the Claremont Tunnel, wasn't it?

A. I presume it was.

Q. You knew, when you were giving this testimony, that there had been a great deal of difficulty in driving the Claremont Tunnel?

A. I did not so assume.

Q. You did not so assume?

A. No. I say I did not consider the ground had been difficult as a tunnel job. I had considered it was a good tunnel.

Q. You considered it a good tunnel?

A. Generally speaking, yes.

Q. Did you consider that, when you bid on the Broadway Tunnel?

A. Probably it had some effect.

Q. You thought the Claremont Tunnel was a good tunnel when you prepared your bid on the Broadway Tunnel? A. Yes, generally.

(Testimony of Stephen Davidson Bechtel.)

Q. At that time, in preparing a bid on a project of some three and a half million dollars, you had in mind that the Claremont Tunnel was a good tunnel?

A. That was one of the considerations.

Q. You so assumed?

A. And I might comment on that, Mr. Tinning: that we had bid on that job; W. A. Bechtel had bid on that job; and bid within three or four or five per cent of the bid of Greer and Meade, who got the job; and, also, I had visited the tunnel; I had gone down, particularly in the east end of the tunnel, and I had seen the ground, myself, and I considered that portion of it very good ground condition.

Q. How far did you go into the east portal of the Claremont Tunnel?

A. Up to the face; as I say, at that time I cannot recall, Mr. Tinning, how far that was. It probably was several thousand feet.

Q. Several thousand feet. What formation was it in when you visited the face?

A. Well, I am not a geologist, and I wouldn't say the exact formation. I would consider it was in the Orindan.

Q. That was from the east portal?

A. Yes. [1057]

Q. That was on the east portal? A. Yes.

Q. When you were in the Claremont tunnel did you observe the section in this tunnel, where the excavation, forward of the excavation, was approximately 12 feet broad and 12 feet high, did you see

(Testimony of Stephen Davidson Bechtel.)

the sets in the Orindan formation where the timbers were crushed and the timber crews were constantly at work setting new timbers before the concrete lining was installed? A. No.

Q. Did you consider that ground self-supporting?

A. I was told at that time by the foreman on the job that the timbers had largely been placed as a matter of protection to the men.

Q. You were not able to judge from your own observation? A. No.

Q. The timber was left in, was it not?

A. I don't know. From hearsay I understand that it was.

Q. Didn't you know whether the timber was left in or not when you prepared your bid for the Broadway Tunnel? A. No.

Q. You did not bother about that?

A. I did not specially bother, some things you know and some things you don't know, I didn't know that.

Q. When you were applying for this 48-hour week in December of 1934, approximately six or seven months after you bid on the job, you referred to the Claremont Tunnel as one in which difficulties had occurred.

A. I understood they had difficulties.

Q. You had that tunnel in mind in making this application, and then you stated that you did not consider it a difficult tunnel when you were preparing your bid for this Broadway Tunnel.

(Testimony of Stephen Davidson Bechtel.)

A. Generally speaking that is correct.

Q. How do you reconcile the fact that you stated that it was a difficult tunnel when you were testifying before Mr. Reardon on December 4, 1934 with your statement now that when you were preparing the bid on the Broadway Tunnel that you did not consider [1058] the Claremont Tunnel a difficult tunnel?

A. Generally speaking, I considered it a good tunnel; there were spots in it which I understood from what others told me were difficult. We were in a bad portion of the Broadway Tunnel, we had 100 feet of it that had been exposed that was different from what we had anticipated, difficult and dangerous ground, and it was that our experience was based on; it was based on that experience that we prepared these letters. I had been out there once a week, and sometimes oftener than that, and observed the conditions which existed on the job at that time.

Q. Didn't you have a warning from the partial geological report that was in the possession of Six Companies, Mr. Calhoun, that shows hill creep and stream wash at the west portal of the tunnel?

A. Mr. Larson told me of that.

Q. So you had warning that you might expect difficulty getting underground?

A. At the portal, that is correct, but it was a question of degree, Mr. Tinning.

Q. Yes, it is all a question of degree?

A. Yes.

(Testimony of Stephen Davidson Bechtel.)

Q. The relative size of the tunnel was a very important matter with respect to strains and stresses that must be maintained by the timbers as you drive further, was it not? A. Yes.

Q. You so state in your letter, that in large tunnels difficulties increased very rapidly compared to the difficulty in small tunnels. A. That is true.

Q. You understood that? A. Yes.

Q. You knew that when you bid on the job?

A. Yes.

Q. Now, with respect to the Claremont Tunnel, which you say at the time you bid you considered to be a good tunnel, when on the 4th of December you testified as I read to you, I will call your attention to the next portion of your statement—you had pre- [1059] viously stated the Claremont tunnel, within a mile or so different conditions developed on both ends of the tunnel three miles long, that we have discussed, and I will now call your attention, after having said you considered this was good ground, there is very wet swelling ground and difficult ground, when you were testifying before Mr. Reardon on that date in respect to the Claremont Tunnel you thought that was bad ground, didn't you?

A. Which do you refer to?

Q. In the Claremont Tunnel.

A. That portions of it were, the portions that Mr. Larson had told me were, and having discussed that with Mr. Larson, and as we were involved in this labor situation at that time, obviously I drew

(Testimony of Stephen Davidson Bechtel.)

upon such information, we had expected some portion was good and we expected some bad ground, and difficult ground in the Broadway Tunnel, just as we had some in the Claremont Tunnel, and when I say the Claremont Tunnel is good, I do not say it is 100 per cent. good. When I say it is bad or difficult, or dangerous in either the Claremont or Broadway Tunnel, I do not mean it is 100 per cent. bad.

Q. So that when you were talking to Mr. Reardon and you said that you had records of bad tunnels, you were referring to tunnels in which some bad ground occurred and in other portions of which there was good ground? A. Yes.

Q. Now, then, when you were referring to the Sacramento Northern Tunnel, where you said the Sacramento Northern Tunnel presented a number of difficult conditions, you had in mind the history of that tunnel, did you not?

A. Well, as I understood it, Mr. Tinning.

Q. You were an expert in this work?

A. No, that is not correct.

Q. You were contracting to do a job in which you guaranteed and represented yourself to be an expert in this contract?

A. Being a contractor does not necessarily mean he is an expert [1060] in geology, or every part of the work he does, but generally speaking I was familiar with that tunnel.

Q. You were generally familiar with the type of work that you were undertaking for the Six Companies in driving this tunnel?

(Testimony of Stephen Davidson Bechtel.)

A. Generally speaking.

Q. And as such you had a general knowledge of the tunnels around in the bay region?

A. Some of them.

Q. And you knew from your general information that the Sacramento Northern Tunnel had presented a number of difficult conditions?

A. I understood that certain parts of the tunnel had been difficult.

Q. There had been slides in them?

A. I didn't know that.

Q. And caving? A. I didn't know that.

Q. Did you know that there had been one slide that made a great big chamber in the roof that required some 40 or 50 cords of wood to fill up before the tunnel could be concreted?

A. I don't recall that; I do remember that there was quite a bit of timbering, that the tunnel was timbered and not concreted, and had been standing for a good many years.

Q. Would you say when you bid on this Broadway Tunnel that the Sacramento Northern Tunnel was not concreted in part? A. How is that?

Q. Would you say that the Sacramento Northern Tunnel, which is about a mile away from the Broadway Tunnel, or two miles, which is shown on the exhibit, here, would you say that that tunnel was not concreted in part, in any section at the time that you prepared your bid and submitted it to this district? A. That is my understanding.

(Testimony of Stephen Davidson Bechtel.)

Q. That was your understanding? A. Yes.

Q. So that you would be in error if the fact appeared that a large part of that tunnel had been concreted long prior to May 22, 1934, when you prepared your bid?

A. No, because you say a large [1061] part of it; I did not say none of it was concreted. I believe some was and some was not, and some was timbered.

Q. The good ground was concreted and the bad ground was timbered? A. I don't know.

Q. You never inspected it? A. No.

Q. The next one, the Northern Pacific Tunnel through Niles Canon in the Coast Range Mountains was extremely difficult. The Northern Pacific Tunnel I believe we have agreed is the Western Pacific Tunnel, wasn't that built by your father?

A. No, it was not.

Q. Was your father's company connected with it?

A. I believe it was constructed by the Utah Construction Company, but I am not sure of that.

Q. You knew, however, that there had been great difficulties in constructing that tunnel?

A. I knew there had been some difficulties.

Q. You knew it took twice as long to construct?

A. I am not clear on that, whether it took twice as long to construct that tunnel or not, but what you have read was my information or understanding at that time.

Q. You also referred to the Hetch Hetchy Tunnel and you said in the Hetch Hetchy Tunnel there

(Testimony of Stephen Davidson Bechtel.)

was swelling and difficult hazardous ground experienced there. Now, the Hetch Hetchy Tunnels through the Coast Range were being constructed just previous to your putting in your bid, were they not?

A. I believe they were still under construction.

Q. Some of the equipment that was used in the driving of the Hetch Hetchy Tunnel was moved onto this job, was it not?

A. You are right on that.

Q. The compressors and some of this other equipment? A. Yes.

Q. You knew the conditions that had been encountered there, did you not, the heavy swelling ground?

A. There were parts where [1062] there was heavy swelling ground; there were some parts that were difficult and other parts were very good.

Q. You knew that?

A. I knew it, that parts of it had been difficult, and I also had heard that parts were very good.

Q. That is what you meant when you went on with the next statement:

> "Through those same mountains we have to construct this tunnel. In the Coast Range you get a different formation—no continuity."

That is what you mean, you were going to meet the same kind of conditions in your work here as they met in the Hetch Hetchy, some was heavy work and

(Testimony of Stephen Davidson Bechtel.)

some sections where the ground would support itself without great difficulty?

A. Yes, there is a possibility of that, some would be very difficult and some would be very good. However, we had contemplated and had figured on, and had bet our money on a condition which was apparent to us at the time from the geological report and from estimates which Mr. Larson made. That was the basis of that bid. Mr. Tinning, there is one thing one must keep in mind in estimating a tunnel, you have to take into consideration the particular job, you cannot make generalities, of course, on what happens some place else, or what happened one mile or five miles away from this particular job, and it is the assumptions and basis for assumptions and specifications and the conditions throughout that particular job that you have to analyze. You have to make your bases or assumptions from it, you have to make your cost of construction from that, and you make your bid from that, and that is what we did in this instance, and as we proceeded here the conditions were different, we recognized they were different, and when we came to this point there were difficulties that we tried to overcome, so that to make more progress, so that we should get the approval of the various changes I have referred to, to change [1063] from the 30-hour week to 40-hour week, so that we would get and hold good men and attract men from other parts of the State.

(Testimony of Stephen Davidson Bechtel.)

Q. Is this true, Mr. Bechtel, that in none of these documents which you have seen, which have been introduced in evidence, nor in the testimony before Mr. Reardon, that you never said at one single place that you had met any unanticipated conditions. That is true, is it not?

A. I might comment on that, that we are not discussing that point there, we thought it was of no moment. The purpose of this communication was to get a week of 40 hours, a week of 48 hours instead of 30, for the employment of men. That was the purpose of this discussion, that was the purpose of this meeting, of these minutes you have got there, and the letters.

Q. So that it is a fact, is it not, that in none of these communications to Mr. Reardon, or to the District, did you state that you had met any unanticipated conditions, although you had been working on the tunnel approximately, on the project about six months?

A. I do not believe that we did.

Mr. Tinning: The defendant offers in evidence a letter dated December 5, 1934, addressed to Hon. T. A. Reardon, Director of the Department of Industrial Relations, State Building, San Francisco, California, and signed by S. D. Bechtel, President. This is an amended or supplemental application or recital in connection with the hearing at which Mr. Bechtel testified on the preceding day. We offer this as Defendant's Exhibit W.

(Testimony of Stephen Davidson Bechtel.)

(The letter was marked "Defendant's Exhibit W.")

DEFENDANT'S EXHIBIT W

December 5, 1934

Honorable T. A. Reardon,
Director of the Department of
Industrial Relations,
State Building, San Francisco, California.

Dear Sir:

We have heretofore entered into a contract with Joint Highway District No. 13 of the State of California for the construction of the Broadway Low Level Tunnel Project. We respectfully request that you examine said project and determine, as to all underground operations in connection with the construction of the tunnels constituting a part of said project, that the application of the provisions of Section 653c-1 of the Penal Code of the State of California is impractical.

We request that, as to this portion of the project, we be permitted to operate on a 48-hour week in lieu of a 30-hour week. In making this request we desire to point out that the only matter involved here is the question of the hours of labor and that the wage scale provided for in our contract with the District will be fully complied with.

In carrying out our contract with the District it will be necessary for us to construct two twin

(Testimony of Stephen Davidson Bechtel.)

bores, each approximately 3,000 feet in length and 36 feet in diameter. These tunnels involve construction work of a hazardous and dangerous character. The safety of the men and the work largely depends upon the experience and ability of the tunnel men employed on the job. All concerned should take every possible step to minimize the dangers and assure the safety of the men.

The tunnel work has been closed down, the principal reason being our inability under existing restrictions, including the provisions of Section 653c-1 of the Penal Code, to procure an adequate supply of competent and experienced labor with which to construct the tunnels with any reasonable degree of safety to life and property.

Our inability to secure competent and experienced labor for the tunnel work arises out of the following conditions:

The tunnels are to be constructed through a part of the Coast Range mountains, which have a long history of difficult and dangerous tunnel construction, due in part to the constantly varying geological formations which are encountered in tunnel work in this range. Our own experience to date on the present project, indicating the presence of soft ground rather than hard rock, combined with the knowledge that the tunnels will cross the line of the Wildcat Fault,

(Testimony of Stephen Davidson Bechtel.)

make it imperative that we anticipate similar difficulty on this job and organize and prepare plans and methods, including adequate supervision and an experienced and versatile working organization, which will enable us to cope with the conditions which we will probably encounter. The size of the tunnels which we are constructing, involving hazards many times greater than those of smaller tunnels constructed nearby, make their construction a dangerous operation and make such precautions absolutely essential.

We have taken all possible steps to be in a position to meet the conditions which we foresee, but without an adequate supply of experienced tunnel men the progress and safety of the project and the safety of human life will be seriously endangered. Improper timbering or blasting, improper performance of the other required operations, or the inability adequately to meet an emergency will inevitably endanger the lives of all the men working in the tunnels and may result in a serious catastrophe. It is impossible, of course, to give minute supervision to the details of the work each man is doing and it is therefore essential that only experienced and competent men be placed on the work. We must have men experienced in soft and wet tunnel construction, as well as men experienced in the construction of large diameter tunnels.

The number of available competent men has been reduced because of the large amount of

(Testimony of Stephen Davidson Bechtel.)

tunnel and mining work being performed in the West at the present time. Unless the determination herein requested is made by you, it will be necessary for us to continue our tunnel operations on a 30-hour week while men employed on the other work are permitted to work much longer hours, running as high as 60% in excess of our maximum, and resulting in increased weekly earnings amounting in some cases to 50% more than the earnings of our men, although the hourly rate of pay is the same or less than ours.

Our experience in the last three months has indicated that we cannot obtain for or hold on this job a sufficient number of qualified and experienced tunnel men unless the existing restriction on the hours of work per week is relaxed so that we may employ men on a basis comparable to that prevailing elsewhere. During the past several months the National Reemployment Service, the agency through which under the provisions of our contract we are obtaining our supply of labor, has conscientiously endeavored to supply us with tunnel men suitable for this job. However, despite the efforts of this agency, we have been able to date to obtain, out of the 230 men furnished to us, only about 30 experienced tunnel men really properly qualified for this work, although we have retained on call approximately 97 men, many of whom are lacking in qualifications and proper experi-

(Testimony of Stephen Davidson Bechtel.)

ence. The remainder of the 230 have either been discharged because of unfitness, as non-citizens, as physically unfit, have quit for other or better jobs, or have been reduced to lower classifications. From this you will observe that the labor turnover has been exorbitant, which tends to increase the hazards.

In addition to the men who have already been supplied there are, we understand, approximately 200 other men who have registered with the National Reemployment Service as tunnel men. From our experience to date we cannot expect to procure and hold, out of this available supply, a sufficient number of competent and experienced tunnel men with which to proceed satisfactorily and safely with the work involved unless we are permitted to work our tunnel crews on a 48-hour week. We believe, therefore, that the tunnel work should not be reopened until the present restriction of 30 hours per week is modified so as to eliminate unnecessary hazards to the men. We feel that in order to protect the project and the lives of the men working on it, this restriction must necessarily be modified so as to permit a 48-hour week for men working underground.

Such modification would affect the following classifications of men performing work underground:

(Testimony of Stephen Davidson Bechtel.)

Tunnel Shifters
Tunnel Miners
Tunnel Timbermen
Tunnel Shovel Operators
Tunnel Locomotive Operators
Tunnel Hoist Men
Tunnel Powdermen
Tunnel Brakemen
Tunnel Chuck Tender
Tunnel Mechanics
Tunnel Laborers
Tunnel Muckers
Tunnel Vibrators
Tunnel Tampers
Tunnel Form Men
Tunnel Concrete Men
Tunnel Concrete Finishers
Tunnel Cement Gun Operators
Tunnel Pump Men
Tunnel Concrete Laborers
Tunnel Drill Operators
Tunnel Electrical Workers
Tunnel Labor—Unskilled
Tunnel Plumbers
Tunnel Portable Hoist Engineers
Tunnel Power Shovel Operators
Tunnel Track Men

In addition, men falling in a few other classifications would be affected during those periods of time in which their principal duties would be

(Testimony of Stephen Davidson Bechtel.)

in connection with the underground portions of the project. All men subject to the modification would be carried on a separate payroll in order to minimize the possibility of confusion, incorrect classification or other mistakes.

As noted above, no changes in rates of pay, classifications, overtime provisions or other conditions affecting the men are requested or will be made.

In conclusion, may we reiterate our belief that the determination requested herein is absolutely necessary in order to safeguard the lives of our employees and to insure the completion of the project in a proper manner. We request that you examine the Broadway Low Level Tunnel Project and determine that, as to the underground portions in connection with the construction of the tunnels, the application of the provisions of Section 653c-1 is impractical and that a 48-hour week be authorized for such work.

Respectfully yours,
SIX COMPANIES OF
CALIFORNIA,
By S. D. BECHTEL,
President.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. W. Filed April 26, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

(Testimony of Stephen Davidson Bechtel.)

Gentlemen, I also wish to offer a letter from the Six Companies, signed by Mr. Bechtel, to the Board of Directors, dated December 5, 1934, which would be apparently the supplemental application with respect to the 30-hour week, that paralleled the one that he had filed with Mr. Reardon. [1064]

Mr. Marrin: No objection.

Mr. Tinning: If your Honor please, we offer a letter signed by Mr. Bechtel as President of the Six Companies of California, addressed to the Board of Directors Joint Highway District No. 13 of the State of California, dated December 5, 1934, and ask that it be admitted in evidence as Defendant's Exhibit in proper order.

(The letter was marked "Defendant's Exhibit X.")

DEFENDANT'S EXHIBIT X

Builders of Low Level Broadway Tunnel
Six Companies of California
155 Sansome Street
San Francisco, Calif.

December 5, 1934

Board of Directors,
Joint Highway District
No. 13 of the State of California,
1448 Webster Street,
Oakland, California.

Gentlemen:

The Broadway Low Level Tunnel Project involves construction work of a hazardous and

(Testimony of Stephen Davidson Bechtel.)

dangerous character. The safety of the men and the work largely depends upon the experience and ability of the tunnel men employed on the job. All concerned should take every possible step necessary to minimize the dangers and assure the safety of the men.

The tunnel work has been closed down, the principal reason being our inability, under existing restrictions in our contract and existing regulations in connection with the employment of labor, to procure an adequate supply of competent and experienced labor with which to construct the tunnels with any reasonable degree of safety to life and property.

Our inability to secure competent and experienced labor for the tunnel work arises out of the following conditions:

The tunnels are to be constructed through a part of the Coast Range mountains, which have a long history of difficult and dangerous tunnel construction, due in part to the constantly varying geological formations which are encountered in tunnel work in this range. Our own experience to date on the present project, indicating the presence of soft ground rather than hard rock, combined with the knowledge that the tunnels will cross the line of the Wildcat Fault, make it imperative that we anticipate similar difficulty on this job and organize and prepare plans and methods, including adequate super-

(Testimony of Stephen Davidson Bechtel.)

vision and an experienced and versatile working organization, which will enable us to cope with the conditions which we will probably encounter. The size of the tunnels which we are constructing, involving hazards many times greater than those of smaller tunnels constructed nearby, make their construction a dangerous operation and make such precautions absolutely essential.

We have taken all possible steps to be in a position to meet the conditions which we foresee, but without an adequate supply of experienced tunnel men the progress and safety of the project and the safety of human life will be seriously endangered. Improper timbering or blasting, improper performance of the other required operations, or the inability adequately to meet an emergency will inevitably endanger the lives of all the men working in the tunnels and may result in a serious catastrophe. It is impossible, of course, to give minute supervision to the details of the work each man is doing and it is therefore essential that only experienced and competent men be placed on the work. We must have men experienced in soft and wet tunnel construction, as well as men experienced in the construction of large diameter tunnels.

The number of available competent men has been reduced because of the large amount of tunnel and mining work being performed in the West at the present time. While under the pro-

(Testimony of Stephen Davidson Bechtel.)

visions of our contract we are restricted to a 30-hour week, men are permitted to work much longer hours, running as high as 60% in excess of our maximum, on the other work, resulting in increased weekly earnings amounting in some cases to 50% more than the earnings of our men, although the hourly rate of pay is the same or less than ours.

Our experience in the last three months has indicated that we cannot obtain for or hold on this job a sufficient number of qualified and experienced tunnel men unless the existing restriction on the hours of work per week is relaxed so that we may employ men on a basis comparable to that prevailing elsewhere. During the past several months the National Reemployment Service, the agency through which under the provisions of our contract we are obtaining our supply of labor, has conscientiously endeavored to supply us with tunnel men suitable for this job. However, despite the efforts of this agency, we have been able to date to obtain, out of the 230 men furnished to us, only about 30 experienced tunnel men really properly qualified for this work, although we have retained on call approximately 97 men, many of whom are lacking in qualifications and proper experience. The remainder of the 230 have either been discharged because of unfitness, as non-citizens, as physically unfit, have

(Testimony of Stephen Davidson Bechtel.)

quit for other or better jobs, or have been reduced to lower classifications. From this you will observe that the labor turnover has been exorbitant, which tends to increase the hazards.

In addition to the men who have already been supplied there are, we understand, approximately 200 other men who have registered with the National Reemployment Service as tunnel men. From our experience to date we cannot expect to procure and hold, out of this available supply, a sufficient number of competent and experienced tunnel men with which to proceed satisfactorily and safely with the work involved unless we are permitted to work our tunnel crews on a 48-hour week and unless we are given a more practical and satisfactory manner of procuring men.

We believe, therefore, that the tunnel work should not be reopened until the present restrictions and regulations as to employment of labor are modified so as to eliminate unnecessary hazards to the men. We feel that in order to protect the project and the lives of the men working on it, the present conditions of our contract restricting the hours of labor must necessarily be modified so as to permit a 48-hour week for men working underground.

Such a modification would affect the following classifications of men perfoming work underground:

(Testimony of Stephen Davidson Bechtel.)

Tunnel Shifters
Tunnel Miners
Tunnel Timbermen
Tunnel Shovel Operators
Tunnel Locomotive Operators
Tunnel Hoist Men
Tunnel Powdermen
Tunnel Brakemen
Tunnel Chuck Tender
Tunnel Mechanics
Tunnel Laborers
Tunnel Muckers
Tunnel Vibrators
Tunnel Tampers
Tunnel Form Men
Tunnel Concrete Men
Tunnel Concrete Finishers
Tunnel Cement Gun Operators
Tunnel Pump Men
Tunnel Concrete Laborers
Tunnel Drill Operators
Tunnel Electrical Workers
Tunnel Labor—Unskilled
Tunnel Plumbers
Tunnel Portable Hoist Engineers
Tunnel Shovel Operators
Tunnel Track Men

In addition, men falling in a few other classifications would be affected during those periods of time in which their principal duties would be

(Testimony of Stephen Davidson Bechtel.)

in connection with the underground portions of the project. All men subject to the modification would be carried on a separate payroll in order to minimize the possibility of confusion, incorrect classification or other mistakes.

No changes in rate of pay, classifications, overtime provisions or other conditions affecting the men are requested or will be made.

In conclusion, may we reiterate our belief that the modification requested herein is absolutely necessary in order to safeguard the lives of our employees and to insure the completion of the project in a proper manner. We respectfully request that you immediately take such action as may be appropriate to permit us to carry on our underground operations on the Broadway Low Level Tunnel Project on a 48-hour week.

Respectfully yours,
SIX COMPANIES OF
CALIFORNIA,
By (Signed) S. D. BECHTEL,
President.

SDB:DP

[Endorsed]: Received Dec. 6, 1934. Joint Highway Dist. No. 13. L. V. Eaton, Ass't Secretary.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. *Plff's* Ex. X. Filed April 26, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

(Testimony of Stephen Davidson Bechtel.)

And the record should show that this is a supplemental application that the Six Companies made to the Joint Highway District respecting the 48-hour week filed the day after the hearing in San Francisco.

Q. Mr. Bechtel, I would like you to look at Exhibit X, which has just been introduced in evidence, which is a copy of your letter dated December 5, 1934, and I will ask you to look at the last paragraph on the first page, where you state:

> "The tunnels are to be constructed through a part of the Coast Range mountains, which have a long history of difficult and dangerous tunnel construction, due in part to the constantly varying geological formations which are encountered in tunnel work in this range. Our own experience to date on the present project, indicating the presence of soft ground rather than hard rock, combined with the knowledge that the tunnels will cross the line of the Wildcat Fault, make it imperative that we anticipate similar difficulty on this job and organize and prepare plans and methods, including adequate supervision and an experienced and versatile working organization, which will enable us to cope with the conditions which we will probably encounter. The size of the tunnels which we are constructing, involving hazards many times greater than those of smaller tunnels constructed nearby, make their

(Testimony of Stephen Davidson Bechtel.)

construction a dangerous operation and make such precautions absolutely essential." [1065]

Now, Mr. Bechtel, when you wrote that letter and were referring to smaller tunnels constructed nearby, you knew that the difficulties that you anticipated in this tunnel were greater than those anticipated in driving through the Claremont Tunnel, didn't you?

A. I am not quite sure of your point.

Q. Read the question.

(Question repeated by the reporter.)

A. Yes.

Q. And when you were referring, when you were discussing the testimony before Mr. Reardon submitted on the previous day to this letter you stated that you expected at the time you testified, on the 4th of December, that you soon would emerge into conditions that would be good or better than any you had encountered. When you wrote this letter on the 5th of December, 1934 you stated that you expected difficult conditions, so as a matter of fact you were expecting exactly what you found there, weren't you?

A. Yes, immediately in front of where we were, we expected bad ground conditions, for the reason that we had wound up these drifts, ended these drifts in formation that had continued to be bad; we did not know how much further we would find it, and we always had the hope that we would get into the better ground which had been prophesied in the

(Testimony of Stephen Davidson Bechtel.)

geological report and on which we had predicated our plans and estimates of construction on, and we were preparing for that worst condition, we were preparing so that we could adequately and competently meet the conditions if it did continue difficult.

Q. You stated that:

"Our own experience to date on the present project, indicating the presence of soft ground rather than hard rock, combined with the knowledge that the tunnels will cross the line of the Wildcat Fault, make it imperative that we anticipate similar [1066] difficulty on this job, and organize and prepare plans and methods."

A. Yes.

Q. You were referring, when you wrote that sentence, to the preceding portion of the paragraph in which you say that the tunnels which had been constructed through a part of the Coast Range Mountains, and these are to be constructed through a part of the Coast Range Mountains, which have a long history of difficult and dangerous tunnel construction—that is what you were referring to, was it not, what you meant in answering my question before you heard about the geological report?

A. I do not think that can be answered "Yes" or "No."

Q. Well, now, let me see if we can get clear on that. In your first sentence of this exhibit you state

(Testimony of Stephen Davidson Bechtel.)

—I am referring now to Exhibit X—the first sentence in paragraph 4 on the first page you state: "The tunnels are to be constructed through a part of the Coast Range of mountains"—you are referring to the Broadway Tunnel there, aren't you?

A. Yes.

Q. "which have a long history of difficult and dangerous tunnel construction"—that refers to the Coast Range of mountains, does it not?

A. Yes.

Q. "due in part to the constantly varying geological formations which are encountered in tunnel work in this range." A. Yes.

Q. You were referring to the geological conditions which were encountered in tunnel work in the Coast Range Mountains?

A. Yes. And that must be tide together with the other parts of the letter, be considered, in order to get an intelligent reflection of what we were presenting here, which was the purpose of the other letter, the other parts of the letter, and the subsequent parts of that paragraph.

Q. All right. "Our own experience to date on the present project, indicating the presence of soft ground rather than hard [1067] rock"—that was your own experience, indicating the presence of soft ground rather than hard rock?

A. Yes. Up to that time we had experienced soft ground instead of hard rock.

Q. "combined with the knowledge that the tun-

(Testimony of Stephen Davidson Bechtel.)

nels will cross the line of the Wildcat Fault''—you are referring to the Broadway Tunnel crossing the Wildcat Fault, in your experience?

A. Yes, the inference—it refers to the Wildcat Fault going through, our deduction from the geological report prepared by Louderback; that is where the information came from, that is where the deduction was made from, and that is what we were still hoping we would get, better ground rather than soft ground; the Wildcat Fault was some place in the middle of the hill, or ahead of us, and provide for conditions so as to meet that condition we had hoped to in between.

Q. And those conditions—your own experience indicating the presence of soft ground rather than hard rock, and the anticipation that you would cross Wildcat Fault, make it imperative that we anticipate similar difficulty on this job—the similar difficulty that you refer to is the difficulty of long history of difficult and dangerous tunnel construction, is it not?

A. Yes, on part of several of these tunnels that have been referred to, on the Hetch Hetchy Tunnels, parts of them were difficult, on parts of the Claremont Tunnel they were difficult, at the same time parts of both the Hetch Hetchy Tunnel and the Claremont Tunnel, and other tunnels in that area had been good, and you have to weigh those things in order to get the real situation in any degree.

Mr. Tinning: Gentlemen, we wish to introduce a copy of order of the Industrial Accident Commis-

(Testimony of Stephen Davidson Bechtel.)

sion, dated the 5th day of December, 1934, subject to your check, but it is a copy. [1068]

Mr. Marrin: Yes.

Mr. Tinning: Under which letter a 40-hour week was granted. If your Honor please, without reading it, we offer in evidence the order of the Department of Industrial Relations of the State of California, dated December 5, 1934, authorizing the contractor to employ men on the Broadway Tunnel in accordance with its application 40 hours per week, and ask that the same be marked "Defendant's Exhibit Y."

(The document was marked "Defendant's Exhibit Y.")

DEFENDANT'S EXHIBIT Y

Before the Department of Industrial Relations of the State of California

In the matter of the petition of the Six Companies of California concerning work being performed under contract with Joint Highway District No. 13 of the State of California for the construction of the Broadway Low Level Tunnel Project.

ORDER

This matter coming on to be considered upon the petition of the Six Companies of California to exempt from the provisions of Section 653c-1 of the Penal Code, work connected with the

(Testimony of Stephen Davidson Bechtel.)

contract between the said Six Companies of California and the Joint Highway District No. 13 of the State of California, for the construction of the Broadway Low Level Tunnel Project, and it further appearing that the construction work provided for in said contract is of a hazardous and dangerous character and that the safety of the men and the work largely depends upon the experience and ability of tunnelmen employed on the job, and it further appearing that all concerned should take every possible step to minimize the dangers and assure the safety of the men employed in the said undertaking, and further acting upon my own knowledge of the matters and things in said petition set forth.

I, T. A. Reardon, as Director of the Department of Industrial Relations, by virtue of the authority in me vested, hereby find that such petition should be granted.

Accordingly it is determined that the application of the provisions of the present 30 hour week law as contained in an act adding a new section to the Penal Code of California to be numbered section 653c-1 is impractical as to those employed in the tunnel work and that the said petitioner be and it is hereby permitted to employ men in the work herein described for a period not to exceed 48 hours in each week.

This determination is subject to such re-

(Testimony of Stephen Davidson Bechtel.)

vision or modification as future economic conditions may justify.

[Seal] (Signed) T. A. REARDON,
Director.

Dated at San Francisco, California, on this 5th day of December, 1934.

State of California,
City and County of San Francisco—ss.

I, Lulu P. Loveland, a Notary Public in and for the City and County of San Francisco, State of California, residing therein, duly commissioned and sworn, do certify that on this 5th day of December, 1934, I carefully compared the annexed copy of order re: in the matter of petition of Six Companies of California concerning work being performed under Contract with Joint Highway District No. 13 of the State of California—construction of Broadway Low Level Tunnel Project, signature T. A. Reardon, Director with the original thereof, now in the possession of Six Companies of California of San Francisco, State of California, and that the same a full, true, and exact copy of said original.

In witness whereof, I have hereunto set my hand and affixed my official seal at my office in the City and county of San Francisco, the

(Testimony of Stephen Davidson Bechtel.)

day and year in this certificate first above written.

LULU P. LOVELAND,

[Not'l Seal]

Notary Public in and for the City and County of San Francisco, State of California.

My Commission expires December 8, 1934.

(Certificate of Notary to Copy of Document.)

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. Y. Filed April 26, 1938. Walter B. Maling Clerk. By J. A. Schaertzer, Deputy Clerk.

If your Honor please, we now offer in evidence a letter from the United States Department of Agriculture, Bureau of Public Roads, District No. 2, dated December 19, 1934, addressed to Wallace B. Boggs, District Engineer, authorizing the contractor on this project to work men on the underground work 40 hours per week. We ask that the authority to the District dated December 19, 1934 be marked Defendant's Exhibit Z.

(The document was marked "Defendant's Exhibit Z.")

(Testimony of Stephen Davidson Bechtel.)

DEFENDANT'S EXHIBIT Z

United States Department of Agriculture
Bureau of Public Roads
District No. 2
Phone: Sutter 3861,
461 Market St.,
San Francisco, California.

December 19, 1934.

In your reply please refer to File No.
Mr. Wallace B. Boggs,
District Engineer,
Joint Highway District No. 13,
1448 Webster Street,
Oakland, California.

Dear Sir:

On December 10, 1934, I received from the Secretary of Joint Highway District No. 13 of the State of California a letter dated December 8 enclosing four certified copies of the application of Six Companies of California, a corporation, the contractor now constructing the project of Joint Highway District No. 13 of the State of California, known as the "Broadway Low Level Tunnel," for a waiver of the provisions of Subsection (b) of Section 1 of Paragraph 20 of the contract to permit said contractor to employ men in the tunnel work not exceeding 48 hours per week, together with

(Testimony of Stephen Davidson Bechtel.)

four certified copies of the resolution of the Board of Directors directing that said application be submitted to the United States Bureau of Public Roads, the Government Engineer under the terms of said contract, for such action as the Government Engineer may consider proper. The Secretary requested me to advise you of my action in respect to said application.

After considering the application of Six Companies of California; the order of T. A. Reardon, Director of the Department of Industrial Relations of California, permitting Six Companies to employ men on tunnel work on the construction of the Broadway Low Level Tunnel not to exceed 48 hours in each week; and letter from R. C. Stillwell, Veterans' Representative, State of California, dated December 10, acting for Mr. John A. Stellern, State Director of the National Reemployment Service, State of California, copy of which is enclosed; Mr. Stellern's letter dated December 15, concurring in Mr. Stillwell's letter, copy enclosed; and after further investigation by the Bureau of Public Roads it is in my judgment not practicable nor feasible, particularly considering safety of workmen, to proceed with the tunnel work on a thirty (30) hour per week basis. Under no circumstances, however, can forty-eight (48) hours per week be granted, but you are authorized to waive the provisions of Sub-

(Testimony of Stephen Davidson Bechtel.)

section (b) of Section (1) of Paragraph 20 of the contract dated June 4, 1934 between Joint Highway District No. 13 of the State of California and Six Companies of California, contractor, and permit the contractor to employ men on tunnel work not to exceed forty (40) hours in any one week, nor more than eight (8) hours in any one day.

If satisfactory as to details the following classification of men performing work in the tunnel as submitted in the application of Six Companies of California, should be adopted and these men should be carried on a separate payroll:

Tunnel Shifters
Tunnel Miners
Tunnel Timbermen
Tunnel Shovel Operators
Tunnel Locomotive Operators
Tunnel Hoist Men
Tunnel Powdermen
Tunnel Brakemen
Tunnel Chuck Tender
Tunnel Mechanics
Tunnel Laborers
Tunnel Muckers
Tunnel Vibrators
Tunnel Tampers
Tunnel Form Men
Tunnel Concrete Men

(Testimony of Stephen Davidson Bechtel.)

Tunnel Concrete Finishers
Tunnel Cement Gun Operators
Tunnel Pump Men
Tunnel Concrete Laborers
Tunnel Drill Operators
Tunnel Electrical Workers
Tunnel Labor—Unskilled
Tunnel Plumbers
Tunnel Portable Hoist Engineers
Tunnel Power Shovel Operators
Tunnel Track Men.

Yours very truly,

(Signed) C. H. SWEETSER,
District Engineer.

[Endorsed]: Received Dec. 20, 1934. Joint Highway District No. 13.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. Z. Filed April 26, 1938. Walter B. Maling Clerk. By J. A. Schaertzer, Deputy Clerk.

I offer now in evidence a letter dated December 27, 1934, addressed to Six Companies of California, by Joint Highway District No. 13 of the State of California, signed by Thomas E. Caldecott, President, and by Harry M. Stow, Secretary, to which is attached a copy of Mr. Sweetser's letter of December 19, 1934, this letter being the authority to Six Companies of California to employ men on the tunnel project 40 hours per week, according to their

(Testimony of Stephen Davidson Bechtel.)

application for 48, and the authority received from the Bureau of Public Roads to employ the men 40 hours a week. I think it is proper to make the statement at this time that on this work—I am sure counsel will agree with me, so there is no reason for spending time on it, the P.W.A., the Public Works Emergency Administration who made the grant in this matter, turned [1069] over all road projects to the Bureau of Public Roads of the Department of Agriculture, and made the District Engineer of the Bureau of Public Roads officiate in the same way as the State Engineer, P.W.A., officiates in all other P.W.A. projects, so that throughout this case if the matter comes up this P.W.A., the Bureau of Public Roads, the term is synonymous, that the District Engineer of the Bureau of Public Roads was the State Engineer to promulgate all of the P.W.A. regulations through the district, and the contractor and the one whom the contractor and the district had to keep in contact with on the work under this project.

(The letter was marked "Defendant's Exhibit AA.")

[Set forth in the Book of Exhibits at page 377.]

[1070]

Mr. Tinning: If your Honor please we offer in evidence a letter from Six Companies of California dated December 26, 1934, signed by T. M. Price, Project Manager. We ask that it be marked in evidence as Defendant's Exhibit "BB."

(Testimony of Stephen Davidson Bechtel.)

(The letter was marked "Defendant's Exhibit BB.")

Mr. Trefethen: To whom is that addressed, Mr. Tinning?

Mr. Tinning: That is addressed to Wallace B. Boggs, District Engineer.

[Set forth in the Book of Exhibits at page 382.]

[1071]

Q. Mr. Bechtel, prior to December 26, 1934, was there ever any communication from Six Companies of California to the District respecting engineering, so far as you know?

A. So far as I know, there was not.

Q. This was the first communication on that subject?

A. There may have been some; but, so far as I know, there was not.

Mr. Tinning: If the Court please, we offer, as Defendant's Exhibit "CC," a letter from Mr. Wallace B. Boggs, District Engineer, addressed to Six Companies of California, in reply to the preceding exhibit. I might state to your Honor that last week Mr. Marrin adopted a subject, methods of engineering, and different subjects that he had; and we are attempting to put in our exhibits in chronological order, so that, by dates, as the drama develops, we will have a complete history as we go along.

(The letter was marked "Defendant's Exhibit CC.")

Mr. Tinning: This letter reads as follows:

(Testimony of Stephen Davidson Bechtel.)

DEFENDANT'S EXHIBIT CC

January 3, 1935.

File: Broadway Tunnel.
Six Companies of California,
Field Office,
Post Office Box 120,
Berkeley, California.

Attention of Mr. T. M. Price, Project Manager

Dear Sir:

Your communication of December 26, 1934, with blue prints attached, and referring to tunnel excavation methods, is acknowledged. It is my understanding that the methods shown and described are subject to such changes as may be necessary to meet ground conditions.

With respect to your outline of engineering work which you desire the District to perform in connection with the establishment of lines and grades, I wish to advise you that the District Engineer will continue to establish lines and grades on a single base line in each tunnel, and that any additional points which your working crews require should be furnished by your own engineering organization as required by the specifications.

Yours very truly,
(Signed) W. B. BOGGS,
District Engineer.

WBB:VE

(Testimony of Stephen Davidson Bechtel.)

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. CC. Filed April 26, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk. [1073]

Mr. Tinning: I offer in evidence, your Honor, as Defendant's "DD," a letter dated January 9, 1935, from Wallace B. Boggs, District Engineer, to Six Companies of California.

(The letter was marked "Defendant's Exhibit DD.")

Mr. Tinning: I will read this letter:

DEFENDANT'S EXHIBIT DD

January 9, 1935.

File: Broadway Tunnel Schedule.

Six Companies of California,
Field Office,
Post Office Box 120,
Berkeley, California.
Attention of Mr. T. M. Price, Project Manager

Dear Sir:

In confirmation of our conversation of January 5 with respect to postponement of work on certain structures, you are advised as follows:

Conditions are unfavorable for work on the Golden Gate Overhead Structure due to the fact that the footing excavations which were

(Testimony of Stephen Davidson Bechtel.)

opened up more than a month ago have been damaged by exposure to heavy rainfall. It will not be feasible to proceed with the completion of these footings until the rainy season is over and the damage can be satisfactorily repaired.

It is not advisable to start footing excavations on the Landvale Overhead and Viaduct structures until the rainy season is over. Conditions similar to those now existing on the Golden Gate Overhead Structure will undoubtedly result if these excavations were made and exposed to the rainy weather which may reasonably be anticipated.

The right-hand Service Road walls at the West Portal southerly from the South buttress of the Portal Buildings cannot be constructed until the fills which have been necessary on account of excessive excavation shall have been thoroughly consolidated and no longer subject to settlement.

Reference is made to Section 6, Subsection (r) "Temporary Suspension of Work" of the specifications, and you are directed that work on the above structures shall not proceed until conditions are considered favorable by the District Engineer. Such postponement shall not constitute a basis for any extension of time for the completion of the contract.

(Testimony of Stephen Davidson Bechtel.)

It is noted that the schedule submitted by you in August, 1934, contemplated the completion of these units by December 1, 1934; if such progress had been made, the conditions now existing with respect to the Golden Gate and Landvale structures could probably have been avoided.

Very truly yours,

(Signed) WALLACE B. BOGGS,
District Engineer.

WBB/VE

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex DD. Filed April 26, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk. [1074]

Mr. Tinning: Q. Mr. Bechtel, simply for the purpose of showing where these other structures were, the Landvale structures were cement structures, to be encountered for an overpass over the main highway where the north and south route intersects the east and west route? A. Yes.

Q. That is the general description. And, at that point, there was [1075] a subway constructed for the railroad, and there was also an overhead viaduct, which ran across the main line of the highway, to carry the north and south traffic there?

A. Yes.

Q. The Golden Gate structure was a bridge down near the westerly end of the project where it crossed a deep ravine,—rather heavy bridge—

(Testimony of Stephen Davidson Bechtel.)

A. It was over an existing street.

Q. —over an existing street, where there was a valley and a street running down?

A. This was not in the valley; it was the valley —the easterly side of the valley.

Mr. Tinning: We offer in evidence, on behalf of the defendant, as Defendant's Exhibit "EE," a letter signed by Six Companies of California, S. D. Bechtel, President, addressed to Joint Highway District, dated January 12, 1935, in reply to Mr. Boggs' letter, which was the previous exhibit,—January 12, 1935—

Well, your Honor, I would like to withdraw the offer and have an order so made; this letter is the same as Mr. Marrin and Mr. Smith put in last week,—Plaintiff's Exhibit No. 53; so we now have the continuity of the record. The letter referred to, Plaintiff's Exhibit No. 53, is already in evidence,—the reply of Six Companies to Mr. Boggs' letter with respect to the outside work; so we will withdraw the last exhibit.

The Court: We will take a recess for five minutes.

(Recess.) [1076]

Mr. Tinning: If your Honor please, we offer in evidence a letter dated January 18, 1935, sent by Six Companies of California, T. M. Price, Project Manager, to Wallace B. Boggs, District Engineer,

(Testimony of Stephen Davidson Bechtel.)

and ask that it be marked in proper order, which I think is EE.

(The letter was marked "Defendant's Exhibit EE.")

I will read it:

DEFENDANT'S EXHIBIT EE

Builders of Low Level Broadway Tunnel.
Six Companies of California,
Field Office,
Post Office Box 120,
Berkeley, California.

January 18, 1935.

(Received Jan. 19, 1935, Joint Highway Dist. No. 13)

Mr. Wallace B. Boggs, District Engineer,
Joint Highway District No. 13,
1448 Webster Street,
Oakland, California.

Dear Sir:

We wish to acknowledge your letter of January 9th, directing us to suspend operations on certain structures until conditions are considered favorable by the District Engineer.

This is entirely satisfactory with us. However, we note that you state that such postponement shall not constitute a basis for any extension of time for the completion of the contract. We would like to ask your reconsidera-

(Testimony of Stephen Davidson Bechtel.)

tion of this, in accordance with Paragraph C, Section 4 of the Specifications, wherein it is stated that if stormy or inclement weather unavoidably delays the work such time shall be added to the aforesaid time for completion.

We are not certain that we will need such an extension. However, the grading of the road is being held up subject to completion of the structures and if the grading is delay in the summer of 1935 to a date that will make it impractical to lay the oil surfacing, it might be advisable to postpone such surfacing until the spring of 1936.

Under such a condition, we believe that a request for extension of time on this account would be in order.

Yours very truly,
SIX COMPANIES OF
CALIFORNIA,
(Signed) By T. M. PRICE,
Project Manager.

[Endorsed]: Received Jan. 19, 1935. Joint Highway Dist. No. 13.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. EE. Filed April 26, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk. [1077]

(Testimony of Stephen Davidson Bechtel.)

The next in chronological order is a letter that was introduced as Plaintiff's Exhibit No. 54, from Mr. Boggs to the Six Companies, and for the purpose of continuity we will refer to it. It was a letter dated January 22, 1935, in which Mr. Boggs says he was unable to agree with Six Companies' contention respecting engineering lines and grades.

Defendant offers as Defendants' Exhibit FF a letter from Mr. Boggs, District Engineer, to Six Companies of California, dated January 23, 1935, which reads as follows:

DEFENDANT'S EXHIBIT FF

January 23, 1935.

File: Broadway Tunnel Extension,
Schedule Time.
Six Companies of California,
Field Office,
Post Office Box 120,
Berkeley, California

Attention of Mr. T. M. Price, Project Manager

Dear Sir:

Your communication of January 18, 1935, with reference to the suspending of operations on certain structures, is acknowledged.

With respect to your request for reconsideration of the decision of the District Engineer that the above suspension should not constitute a basis for extension of time for completion of the project, you are advised as follows:

(Testimony of Stephen Davidson Bechtel.)

The structures upon which work is temporarily suspended are along the West Approach roadways and connections. The time required to complete these units is relatively short, as indicated on your submitted schedule; related work, which cannot be performed until these structures are completed, is small, and would not require any considerable time for performance. Other phases of the work, upon which the time of completion of these structures can have no bearing, would seem to be the controlling factors with respect to completion of the Contract on schedule time; these other phases are not affected by the suspension order.

Therefore, it does not appear that the suspension ordered by the District Engineer can in any way constitute a basis for the granting of an extension of time for the completion of the project.

Yours very truly,

(Signed) WALLACE B. BOGGS,
District Engineer.

WBB/VE

CC to Mr. Archibald B. Tinning, Attorney, Martinez.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. FF. Filed April 26, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk. [1078]

(The letter was marked "Defendant's Exhibit FF.")

(Testimony of Stephen Davidson Bechtel.)

If your Honor please, Defendant offers in evidence a letter dated January 24, 1935, from Six Companies of California, signed by T. M. Price, Progress Manager, addressed to Wallace B. Boggs, District Engineer, as Defendant's Exhibit GG.

(The document was marked "Defendant's Exhibit GG.")

DEFENDANT'S EXHIBIT GG

Builders of Low Level Broadway Tunnel
Six Companies of California,
Field Office,
Post Office Box 120,
Berkeley, California.

January 24, 1935.

Mr. Wallace B. Boggs, District Engineer,
Joint Highway District No. 13,
1448 Webster Street,
Oakland, California.

Dear Mr. Boggs:

Acknowledging your letter of January 23rd, relative to extension of time on account of suspending operations on certain structures.

We do not mean our previous letter to be an application for extension of time but wish merely to call your attention to the paragraph of the Specifications governing this.

We merely wish to put ourselves on record in the matter with the thought that actual decision as to extension might be made at the time

(Testimony of Stephen Davidson Bechtel.)

application is made if decided necessary and provided by the specifications.

Yours very truly,
SIX COMPANIES OF
CALIFORNIA,
By (Signed) T. M. PRICE,
Project Manager,

[Endorsed]: Received January 25, 1935. Joint Highway District No. 13.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. GG. Filed April 26, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

If your Honor please, Defendant offers in evidence as Defendant's Exhibit HH the letter dated February 5, 1935, from Wallace B. Boggs, District Engineer, to Six Companies of California, which reads as follows:[1079]

DEFENDANT'S EXHIBIT HH

February 5, 1935.

File: Broadway Tunnel
Schedule of construction.

Six Companies of California,
Field Office,
Post Office Box 120,
Berkeley, California.

Attention of Mr. T. M. Price, Project Manager

Dear Sir:

A construction schedule showing anticipated progress on various sections of the work was

(Testimony of Stephen Davidson Bechtel.)

submitted by you on August 9, 1934.

An examination of this schedule at the present time shows that the progress indicated thereon has not been maintained, especially with respect to the tunnel, which would appear to be the controlling factor in completing the Contract within the specified time.

You are hereby requested to submit immediately a revised construction schedule indicating the progress you expect to maintain on the various units of the work.

Kindly submit this schedule in triplicate.

Very truly yours,

(Signed) WALLACE B. BOGGS,
District Engineer.

WBB/VE

CC to Mr. C. H. Sweetser, District Engineer, U. S. Bureau of Public Roads, S. F.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. HH. Filed April 26, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

(The letter was marked "Defendant's Exhibit HH.")

There has already been introduced in evidence as Defendant's Exhibit O a schedule showing the proposed rate of progress on this work which was submitted to the district by Six Companies of California, with its letter of February 12, 1935. I am

(Testimony of Stephen Davidson Bechtel.)

going to ask some questions about that, Mr. Bechtel. Would you like to have the exhibit before you?

A. Yes.

Q. I am now referring to Defendant's Exhibit O, which was the schedule which was submitted on February 12, 1935, to the District. Mr. Bechtel, when you submitted the schedule with the letter of February 12, 1935, no communication was sent to the district in which you in writing objected or stated that the work had been held up due to the fact that you were deceived or misled by the ground conditions that you had encountered up to that time? [1080]

Mr. Marrin: You say that he sent that. It is not a fact that he sent it.

Mr. Tinning: The Six Companies sent it. That is a fact, you made no complaint in writing or otherwise that you had been deceived by ground conditions at the time you submitted this schedule?

A. To the best of my knowledge you are correct.

Q. That schedule of your proposed progress and schedule for construction was submitted by Six Companies following the request of Mr. Boggs which was dated February 5, 1935?

A. It appears that way.

Q. At this time, Mr. Bechtel, what steps had been taken on the work to place the concrete lining

(Testimony of Stephen Davidson Bechtel.)

in the tunnels as you proceeded with the excavation?

A. This schedule was submitted to you by Mr. T. M. Price, our Project Manager. The question you just asked, I believe, could be best answered by Mr. Price, who was there full time, and I think, and it is my understanding that it is proposed by our counsel to develop that point thoroughly by Mr. Price and by other witnesses.

Q. You seem fully advised on that. What was your knowledge of what steps had been taken at the tunnel on February 12, 1935 with respect to proceeding with the concreting?

A. I was familiar constantly throughout the job of the general plans of construction and the general procedure which was being followed. So far as the details at this particular time, I think that can be best developed by Mr. Price.

Q. You know, do you?

A. I can't say at this time.

Q. Did you know then? A. Yes.

Q. You have forgotten?

A. I do not recall at this moment.

Q. Isn't it a fact that at this time on the job there were no concrete forms?

A. I can't answer that.

Q. Isn't it a fact that the concrete forms were not ordered until [1081] sometime in May?

A. I do not recall the date.

Q. You don't recall? A. No.

Q. Isn't it a fact that there was no concrete ag-

(Testimony of Stephen Davidson Bechtel.)

gregates plant in place or in operation on the job on February 12, 1935?

A. I do not recall. I believe you can get that information from Mr. Price, and subsequent other men. I will get it for you, Mr. Tinning, if you like, but I have not it available.

Q. You were not following it very closely?

A. I was following it very closely.

Q. What is the reason you cannot tell us in what stage the preparations were with respect to your concrete lining at that time?

A. For the reason that we had on the job a competent organization that we had trusted with the job. We had as a company policy an executive committee of which I was chairman, of which Mr. H. J. Lawler, of the Utah Construction Company was a member, and of which Mr. Frank Modglin was also a member; we three, and more particularly Mr. Lawler and I, were constantly in touch with the project matters of major importance and major policy, and the detail of handling the project, of the day by day details, and the day by day relations with the district were handled by the field organization that we had selected, and in whom we had placed confidence and whom we placed there for that purpose.

Q. The answer to my question is you don't know whether there was concrete forms on the job at that time? A. I do not recall.

(Testimony of Stephen Davidson Bechtel.)

Q. Did Mr. Larson, your tunnel superintendent, tell you that the concrete should be kept up in the tunnel to within 300 to 350 feet of the excavated face?

A. I do not recall any such statement.

Q. You don't recall that? A. No.

Q. Do you think it ought to be?

A. It depends on the conditions. [1082]

Q. Do you think that under the conditions in the Broadway Low Level Tunnel that the concrete should have been kept up to from 300 to 350 feet of the excavated face?

A. Looking back on it I would say yes.

Q. Did you believe that in February 1935?

A. I don't recall whether I believed it at that time.

Mr. Tinning: I will offer in evidence, if your Honor please, a letter dated April 2, 1935, from Six Companies of California, signed T. M. Price, Project Manager, addressed to Wallace B. Boggs, District Engineer, as Defendant's Exhibit II. I will read it:

[Set forth in the Book of Exhibits at page 389.]

[1083]

(The letter was marked "Defendant's Exhibit II.")

I offer in evidence as Defendant's Exhibit JJ a letter from Wallace B. Boggs, District Engineer, to the Six Companies of California, dated April 9, 1935. It reads:

(Testimony of Stephen Davidson Bechtel.)

DEFENDANT'S EXHIBIT JJ

April 9, 1935.

File: Broadway Tunnel Concreting.

Six Companies of California,
Field Office,
Post Office Box 120,
Berkeley, California.

Attention of Mr. T. M. Price, Project Manager

Dear Sir:

On April 2 you furnished me with your Drawing No. 19 entitled, "Sketch Showing Form and Concreting Arrangements, March 22, 1935", together with a letter setting forth general methods of operation.

While it is evident that this drawing does not show complete details and it is assumed that you will have worked out such details before commencement of the operation, the following comments are made on points which would seem to indicate the necessity of further study:

1. Details are not shown as to how the upper pipe will be supported when advanced to extreme position.

2. No provision is shown for handling the upper pipe should the situation arise that a double row of reinforcing steel would be required.

(Testimony of Stephen Davidson Bechtel.)

3. In case one pump breaks down, some type of cross-over connection may be necessary in order to keep the height of concrete the same on both sides.

4. It would appear that the shape of the upper section of the elephant trunk will cause the spilling over of concrete in dropping past the gate.

5. Consideration should be given to the slope of chutes, particularly the upper chute. Slopes should be sufficient so that concrete of the designed consistency will flow.

6. Provisions for jacking forms during pour are not shown.

7. It is assumed that you are satisfied, from your own experience, that the gate devices in the lower pipe lines will function satisfactorily.

8. No detail is shown of method of handling 9-ft. segments on curves. Your attention is directed to the necessity of obtaining smooth lines without fins.

9. Method of filling upper part of arch is not clear. This refers especially to getting the concrete in, around and back of the timbers.

10. Will the annular construction joints in the arch ring coincide with the construction joints in the finished wall section?

(Testimony of Stephen Davidson Bechtel.)

11. Has consideration been given, when determining that form section shall be 27 feet in length, to the time cycle for the various operations in order to complete the construction within the time limit?

These comments are based upon the preliminary design shown and it is assumed that more details will be submitted for discussion as your design progresses.

The District Engineer will be pleased to discuss these matters with you from time to time as you desire.

Yours very truly,
(Signed) WALLACE B. BOGGS,
District Engineer.

WBB/VE

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. JJ. Filed April 26, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk. [1084]

(The letter was marked "Defendant's Exhibit JJ.")

Q. Mr. Bechtel, at the time the Six Companies received this letter, did you complain that you had been deceived about ground conditions and that it had caused you to be delayed in the progress that you indicated by your schedule submitted in August, 1934?

A. What was the date of this letter?

(Testimony of Stephen Davidson Bechtel.)

Q. April 9. A. I do not think so.

Q. As far as you know there was no complaint made at that time? A. Not then.

Q. How far underground were you about the 9th or 10th of April?

A. I don't recall that, Mr. Tinning.

Q. Did you give any consideration to paragraph 11 in the letter of Mr. Boggs dated April 9th, where he told you that your cycle of operations apparently had been worked out without giving consideration to the fact that you had a time limit on your contract work?

A. This letter was addressed to Mr. T. M. Price, as I understand it, was received by Mr. Price, on the job, was handled as a job matter, and is not a matter which would come to me.

Q. It did not go to the Executive Committee?

A. This was handled on the job.

Q. This letter did not come to the executive committee? A. Not that I know of.

Q. It is a fact that matters of time, extension of time within which the job would be completed, were matters that did not come to your executive committee?

A. No, that is not correct; the matter of time extension, and the general progress and general schedule, general methods, were discussed with our executive committee, [1086] and were discussed with the other directors of the Six Companies of California, and their advice gotten as to the proper

(Testimony of Stephen Davidson Bechtel.)

procedure and necessary action taken to carry the project forward in the most expeditious manner that was possible, or practical to arrange at that time.

Q. Then, so far as you know, no attention was paid to the provision of this letter of April 9, 1935, paragraph 11, "Has consideration been given, when determining that form section shall be 27 feet in length, to the time cycle for the various operations in order to complete the construction within the time limit?

A. The proper procedure on a letter of that kind, the way we had them—

Q. I do not like to interrupt, but what I asked you was as to whether or not your committee gave any attention to that protest.

A. This letter did not come to the attention of the committee.

Q. Did your committee give any attention to it?

A. It did not come before the committee.

Q. And you made no complaint at that time?

A. I do not think so. Mr. Price may have but if so I don't know.

Q. The next matter in evidence is a letter dated April 19, 1935, in which Mr. Fry wrote to Mr. Price, which is already in evidence. It is Defendant's Exhibit F. That was with respect to conversations concerning the ground that Mr. Fry called to Mr. Price's attention.

Mr. Marrin: Mr. Bechtel's name was not mentioned in that letter.

(Testimony of Stephen Davidson Bechtel.)

Mr. Tinning: It was addressed to the Six Companies and Mr. Price the Project Manager.

If your Honor please, we offer in evidence a letter dated May 1, 1935, from Six Companies of California, signed by T. M. [1087] Price, Project Manager, addressed to Mr. Wallace B. Boggs, District Engineer, and ask it be marked Defendant's Exhibit KK.

(The letter was marked "Defendant's Exhibit KK.")

I will read it:

DEFENDANT'S EXHIBIT KK

Builders of Low Level Broadway Tunnel
Six Companies of California,
Field Office,
Post Office Box 120,
Berkeley, California.

May 1, 1935.

Mr. Wallace B. Boggs, District Engineer,
Joint Highway District 13,
1448 Webster St.,
Oakland, Calif.

Dear Sir:

We are making plans for the driving of drifts from the east portal, to meet the driving from the west portal.

Our plans are not yet mature enough to advise you definitely as to what method will be

(Testimony of Stephen Davidson Bechtel.)

pursued; however, in general, we plan at present to drive two wall plate drifts in each bore, from twelve to sixteen feet above the grade line, by means of mucking machines and battery locomotives. We plan on installing sufficient plant on that end, to permit this construction.

Very truly yours,
SIX COMPANIES OF CALIFORNIA,
By (Signed) T. M. PRICE,
Project Manager.

[Endorsed]: Received May 2, 1935. Joint Highway Dist. No. 13.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex KK. Filed April 26, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

Q. Mr. Bechtel, were you in touch with the situation at the tunnel at the time the decision was made on or about May 1 to drive the drifts from the east portal westerly toward the excavation?

A. Yes.

Q. At that time did you make any complaint in writing to the District that you had been deceived or misled by the geological report? A. No.

[1088]

Mr. Tinning: Q. At that time, did you make any complaint, in writing, to the District, that you

(Testimony of Stephen Davidson Bechtel.)

had been deceived or misled by the geological report? A. No.

Q. And by "you," I am referring to Six Companies. A. Not to the best of my knowledge.

Q. At that time,—referring to May 1st,—did Six Companies make any demand, in writing, for extra compensation, for extra work in excavation or extra cost of timbering?

A. To the best of my knowledge, no.

Q. You did not make any complaint of any kind at that time, did you?

A. Yes. Yesterday, or Friday, I reviewed to you the discussion I had with Mr. Boggs.

Q. Well, that was at some time in April or May? A. April or May.

Q. That was with respect to the time you were asking for time extension? A. That is correct.

Q. But you said nothing, at any conversation, to Mr. Boggs, or any representative of the District, regarding having been misled by geological report?

A. Well, the fact the ground conditions were different.

Q. Did you demand extra pay?

A. Not that I recall.

Q. Did you refuse to proceed with the work at that time? A. No; we did not.

Q. How many feet underground were the tunnels on May 1, 1935,—the main excavation,—approximately?

Mr. Marrin: Q. If you know.

(Testimony of Stephen Davidson Bechtel.)

A. I do not recall; but, I believe, about five or six hundred feet in each of the two tunnels.

Mr. Tinning: Q. That is about what Mr. Larson testified to; that happens to be almost synchronous with his leaving the work on the 30th of April. At that time, May 1, 1935, you had approximately [1089] 100 feet of concrete lining that had been placed in November of 1934, as you went underground; that has all be described in detail here; and there was no other concrete lining in the tunnel except that that had been placed approximately 6 months before?

A. Well, I am not clear on the date, Mr. Tinning; but approximately. My belief is that the concreting was resumed; however, that can be best developed from your point,—clarified,—by others, as they have pertinent information on that particular subject.

Q. Isn't it the fact, at the time you had this conversation with Mr. Boggs, that you referred to yesterday, in April or May, there were not concrete forms on the job and there was no concreting, no concrete aggregates plant ready for operation on the job, and that no concreting had been done since the first 200 feet in rings had been put in, in November of 1934,—100 feet in each tunnel?

A. I don't recall.

Q. You don't recall that? A. No.

Q. You would not say it was not a fact?

A. I would not say it was not a fact.

(Testimony of Stephen Davidson Bechtel.)

Q. You would not say it was not a fact that the forms hadn't even been ordered at that time?

A. I wouldn't say that that was not a fact.

Mr. Tinning: If the Court please, we offer in evidence, as defendant's exhibit next in order, a letter from Six Companies of California, dated May 1, 1935, addressed to Wallace B. Boggs, District Engineer.

(The letter was marked "Defendant's Exhibit LL.")

Mr. Tinning: This letter is dated May 1, 1935, and reads:

DEFENDANT'S EXHIBIT LL

Builders of Low Level Broadway Tunnel
Six Companies of California,
Field Office,
Post Office Box 120,
Berkeley, California.

May 1, 1935.

Mr. Wallace B. Boggs, District Engineer,
Joint Highway District No. 13,
1448 Webster St.,
Oakland, Calif.

Dear Sir:

We wish to confirm our statement of excavation we plan to perform this year.

In view of the fact that this job will run through the winter of 1935-36, we do not want

(Testimony of Stephen Davidson Bechtel.)

to undergo any expense of sloping slide areas or furnishing roadway excavation. If this work is done this year, it would probably need to be done again after it has stood a second winter.

We plan therefore to

1. Complete the roadway and finish it from Broadway to Golden Gate Avenue.

2. To rough out the slides and remaining roadway excavation on the remainder of the West approach.

3. Complete the backfill of the lower P. G. & E. wall, Sacramento Northern Bridge, Landsvale Viaduct, and any other structure that may be backfilled.

4. Complete the structure excavation.

Very truly yours,

SIX COMPANIES OF CALIFORNIA,

By (Signed) T. M. PRICE,
Project Manager.

P:C

[Endorsed]: Received May 2, 1935. Joint Highway Dist. No. 13.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. LL. Filed April 26, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk. [1090]

(Testimony of Stephen Davidson Bechtel.)

Mr. Tinning: Q. Mr. Bechtel, just to get in mind what this letter covers,—the work that you planned to complete in the summer of 1935 was the grading of roadway from the westerly end of the project, or Keith Avenue to Golden Gate Avenue; that was actually finished at that time, so that there was travel across that to serve that part of Oakland, was there not?

A. If I remember correctly, I believe so.

Q. In the fall of 1935, you also, from a point along the highway portions of the project, roughed out the slopes that had come in during the winter and the remaining roadway excavation,—the remainder of the work up to the tunnel?

A. I think so.

Q. And you completed the building around the Pacific Gas & Electric—What I am pointing to now is a large substation of some kind,— [1091] an electrical power station of the Pacific Gas and Electric Company, in the bottom of the canyon; and you completed backfilling behind that wall some 30 or 35 feet in height, which was constructed with that roadway cut through the P. G. & E. property?

A. Yes.

Q. You also concluded the backfilling that was necessary around that structure and other structures that had been built along the road, and you completed—or planned to complete structural excavations for all the other structures on the project so that you would not have this difficulty that had occurred in the preceding year where work had to

(Testimony of Stephen Davidson Bechtel.)

be stopped because water got in the foundations of your structure before you got your concrete in? That work, incidentally, Mr. Bechtel, was all let on subcontracts, wasn't it? A. Practically all

Q. Were Six Companies doing any work outside of the tunnel itself in the season of 1935?,

A. Well, apparently we installed a plant on the east end——

Q. Well, I guess we did not understand each other. You said "practically." I am not referring to the installation of plants or concrete equipment or other matters which were used in the construction of the tunnel. The plant that you installed to drive the drift from the east end, east portal, was part of your tunnel plant, wasn't it?

A. Yes.

Q. You were doing that work; and, of course, those plants were your own plants; but isn't it a fact that no part of the work outside of the tunnel work was done by Six Companies, and that all the rest of it was subcontracted to various subcontractors?

A. With this exception: we had subcontracted the grading work to McKinley and Crowell, at the completion of the main portion of the grading proper, and the other work that was under their contract, and they asked to be relieved of the completion of that work, because it was apparent that they could not proceed to complete same immediately; it would [1092] mean quite a gap in their opera-

(Testimony of Stephen Davidson Bechtel.)

tions; and we relieved them of that operation, and undertook to do it and use our own force.

Q. Referring again to Defendant's Exhibit "P,"—the perspective map,—all of the grading work that you refer to is the grading work—it is this possible 11,000 feet of highway from Broadway to Keith Avenue up to the west portal of the tunnel; that was done by subcontractors, wasn't it?

A. It was originally all to be done—That was what I am referring to—It was completed by Six Companies of California, later, with their own force.

Q. In other words, the winter of 1934-35 brought a delay in that work; the grading was done after that; you did it, yourself, with your own equipment—is that it?

A. Well, the water brought about delays in the work. They completed the work so far as they could at the time; the job could not be completed in a continuous fashion, and, therefore, we relieved them of responsibility of staying there to complete that.

Q. The reason they could not complete it was that your tunnel work was not far enough along; they had to have materials in the tunnel fill excavated from the tunnel?

A. Well, that was one of the reasons.

Q. Was there any other reason?

A. One reason was that, as outlined in one of the recent letters here, there were slides contemplated; and, if slides did take place in the ensuing

(Testimony of Stephen Davidson Bechtel.)

winter, it would have to be resloped afterwards, before being accepted by the Highway Department.

Q. In other words, you had a contract for this entire project, of one unit; and the requirement was that the contractor give the District the slopes in accordance with the plans and specifications at the end of the job?

A. That is the way you interpret it.

Q. Is there any other question about that in your mind?

A. Well, [1093] on the practice of it, yes; but not on the interpretation——

Q. Well, at any rate, that is what you had in mind at that time: that you would have to,—when you turned over your job, you could not turn it over with slides that had come down in the winter——

A. Well, that was not the point so much, as I understood the resloping; but I will say "Yes" to your point.

Q. That method of using subcontractors for the grading work and the construction of these various structures, and they are sometimes substantial, sometimes they are large, concrete structures—but those were all built by subcontractors, weren't they?

A. Well, substantially, yes.

Q. Well, were there any parts of those structures, other than the west portal down to Broadway, that were built by Six Companies, itself?

A. There were portions of it that were worked on by Six Companies.

(Testimony of Stephen Davidson Bechtel.)

Q. Name some of them.

A. Landvale Overhead Crossing was started by a subcontractor who found the conditions so tough he practically went broke.

Q. Did Six Companies do some work on there?

A. I think they did.

Q. But it was subcontracted?

A. The start was.

Q. Was all the work west of the portal of the tunnel subcontracted?

A. Originally contemplated to be.

Q. Well, was it? Did you let contracts for all parts of the work? A. Yes.

Q. Some of those contractors did not complete their work? A. That is correct.

Q. Now, the next diagram, in chronological order, is a letter from Six Companies of California to the District, which has already been introduced in evidence as Plaintiff's Exhibit No. 45,—the letter of June 10, 1935, requesting a 180 day extension of time. That is [1094] in evidence. And the next is Plaintiff's Exhibit No. 55,—letter of June 10, 1935, relative to engineering.

Then the next is a letter of July 12, 1935, Plaintiff's Exhibit No. 56, in which the District notifies Six Companies that its request for extension of time had been denied.

Q. Mr. Bechtel, when you received this letter—by "you," I refer to "Six Companies"—received that letter from the District, on or about July 12,

(Testimony of Stephen Davidson Bechtel.)

1935, notifying Six Companies that it had not received the extension of time; that the extension of time requested by your letter of the 10th of June had been denied, did Six Companies cease work?

A. It did not.

Q. It continued with the work? A. Yes.

Q. Did you ask, at that time, for any extra pay?

A. To the best of my knowledge, we did not.

Q. The next exhibit, in chronological order, is already in evidence,—Plaintiff's Exhibit No. 56, the letter of July 12, 1935, to Six Companies from the District, rejecting the claim of Six Companies for the performance of additional engineering by the District. Did Six Companies cease work at the time it received that letter?

A. What date was that?

Q. The letter denying the request for additional engineering,—July 12th. A. It did not.

Mr. Tinning: Your Honor, I don't know how much longer you care to go on tonight; I have lots of ammunition here, but we are going into another subject.

The Court: We will meet downstairs in Room 276 tomorrow morning, as there is some construction work to be done in this room for several days. We will take an adjournment until tomorrow at ten o'clock.

(Thereupon, an adjournment was taken until Wednesday, April 27, 1938, at 10 o'clock a. m., at Room 276.) [1095]

(Testimony of Stephen Davidson Bechtel.)

Wednesday, April 27, 1938.

STEPHEN DAVIDSON BECHTEL,

Cross Examination (Resumed).

The Court: Proceed, Gentlemen.

Mr. Tinning: Mr. Clerk, may I have Plaintiff's Exhibit No. 47 and Plaintiff's Exhibit No. 57?

Q. Mr. Bechtel, on last Friday Plaintiff's Exhibit No. 47 was introduced, a letter dated July 26, 1935, a letter signed by you, in which you, on behalf of the plaintiff in this action, stated in substance—I am going to hand you the exhibit, because it is rather a long document, and I think you will be able to follow this examination—in which you stated on behalf of the Six Companies that you thought the question of engineering should be submitted to arbitration, and in which you stated that if the arbitration was agreed to the conditions upon which it would be entered into, expenses, etc., and on the same day you also wrote a letter to the District, Plaintiff's Exhibit No. 47, in which you referred to the District's letter of June 12th, which is also in evidence, rejecting Six Companies' application for an extension of time.

Mr. Smith: July 12th instead of June 12th, Mr. Tinning.

Mr. Tinning: July 12th. The letter from the District was dated July 12th, and the application for extension of time of Six Companies to the District was dated June 10th.

(Testimony of Stephen Davidson Bechtel.)

Mr. Smith: That is right.

Mr. Tinning: These letters were both written on the same day. If you will look at the exhibit I think that is clear. That is correct, isn't it?

A. Yes.

Q. And one letter sought arbitration of the engineering contention that you were making, and the other letter respecting the extension of time stated that the delay that had occurred had been [1096] causd by the heavy rainfall of the last rainy season, which was much heavier than any season in recent years, and by the fact that the condition of the ground was such that faster progress was impossible, the actual ground conditions had been far worse for working purposes than the condition of the ground shown by the geological report made by the geologist of the District, and this had resulted in retarding the speed of the work. Now, this was the first time, was it not, Mr. Bechtel, that there was any written protest or objection, if this be an objection, or mention in writing of the geological report which you have testified misled Six Companies, this is the first time there was any written mention of that geological report in any communication of Six Companies to the District?

A. I believe that is correct.

Q. And this was fourteen months, approximately, after the contract? A. Yes.

Q. Each tunnel had been driven somewhere between 800 and 900 feet into the mountain at that time; that is true, isn't it?

(Testimony of Stephen Davidson Bechtel.)

A. Approximately.

Q. Now, in that same letter, in the letter sent the same day, rather, in which you were seeking arbitration, you also stated, if you will please refer to the last page of Plaintiff's Exhibit No. 57:

> "In the event you are unwilling to submit the matter to arbitration we will expect to immediately commence such legal proceedings as will be necessary or proper to determine our rights in the matter. In order that a speedy settlement may be reached we ask that you reply to this letter by August 7, 1935. If we do not receive an affirmative answer by that date we will consider that you do not care to arbitrate the matter and commence such legal proceedings as may be proper, as above suggested."

Now, at the same time that you asked for arbitration, at the same [1097] time you protested and objected to the engineering decision, at the same time you objected to the extension of time, you stated if you did not have a reply from the District with respect to the arbitration by August 7th that you would commence legal proceedings. As a matter of fact, you received no reply from the District, that is true, isn't it?

A. I believe that is correct.

Q. Well, you know it, don't you?

A. Well, I believe it is so.

(Testimony of Stephen Davidson Bechtel.)

Q. You did not start any legal action, did you?

A. That is right.

Q. Well, that is correct? A. Yes.

Q. And you proceeded with the work from that time on for a considerable period? A. Yes.

Q. You stated in the letter respecting the extension of time that the rainfall during the winter of 1934-35 was unusually heavy, and much heavier than it had been for a number of years before. You remember that statement? A. Yes.

Q. As a matter of fact, don't you know that the rainfall in the season of 1934-35 was less than normal average rainfall until the month of April, 1935?

A. The average rainfall for that winter was considerably over the average in previous years.

Q. Isn't it a fact that the rainfall, the mean average rainfall at Berkeley, where there is a Government station, it is the nearest station to this work, is 25.12 inches, and that the total rainfall for the season of 1934-35, as shown by the records of the Berkeley station, was 25.24 inches?

A. I do not know that to be a fact. I can tell you that I personally reviewed, or had compiled, the rainfall for the winter period from October to April, inclusive, and that the period of time in 1934-35 was substantially over.

Q. How much over?

A. Approximately 50 per cent.

(Testimony of Stephen Davidson Bechtel.)

Q. 50 per cent. Did you examine, yourself, or under your instructions have examined the records of the United States Weather Bureau that are published showing rainfall measurements taken [1098] at Berkeley, at the University of California, the nearest Government station to this work?

A. On my instructions——

Q. Will you answer "Yes" or "No," please?

A. No, so far as the records in Berkeley that you refer to. On my instructions, and believing that it was the closest available Government statistics I had the data for the past previous years procured from the Department of Agriculture, from their proper subdivision that keeps the rainfall records officially.

Q. Well, what station?

A. Oakland, believing that that was the closest one to the job.

Q. Well, the Government station for rainfall probably was at Chabot, is it not?

A. I do not know.

Q. And they also keep rainfall records at the Oakland Airport?

A. If that was the case I did not know it.

Q. You did not know it?

A. My instructions were to get the data from the station that was nearest to the work, and it came back from Oakland.

Q. You will concede, will you not, that the University of California is closer to this work than downtown Oakland, is it not?

(Testimony of Stephen Davidson Bechtel.)

A. I would say probably—I would say approximately the same distance.

Q. All right. Would you say that it is not a fact, as shown by the records of the United States Weather Bureau, that up to April 1, 1935, the rainfall records at Berkeley station show that the rainfall was less than the mean average rainfall?

A. The only records——

Q. Will you please answer "Yes" or "No," and then explain? A. I cannot answer that.

Q. You do not know that. You do not know that there was over 5 inches of rain in the month of April, 1935?

A. I do not know that. [1099].

Q. That is what brought the average above the mean average rainfall?

A. That is not correct.

Q. That is not correct?

A. To my best belief based upon the investigation that I had made.

Q. You continued to work through the month of August after delivering the ultimatum of July 26, 1935, which we have already referred to, and in which you said that unless there was arbitration that you were going to take legal action, you continued to work, and on August 23, 1935, you wrote a letter to the District—Mr. Clerk, may we have Plaintiff's Exhibit No. 48 in evidence—you wrote a letter in which you stated that,

(Testimony of Stephen Davidson Bechtel.)

"At the present time we are engaged in installation of the type 'A' concrete tunnel section, and while we will continue to proceed with the installation of same in the excavated portions of the two tunnels, we hereby notify you that we are informed and advised by our engineers that the section in question is inadequate and unsafe."

That is the first paragraph of the letter signed by you bearing date August 23, 1935. You were referring in that paragraph, were you not, to the permanent concrete lining which the plans and specifications called for, you were to install under your contract a lining which was required to be of the minimum thickness of 2 feet at the top or crown of the tunnels, and 5 feet at the base, that is what you were referring to?

A. The permanent lining.

Q. Yes. You were not referring at that time to the timbers with which you were supporting the excavated and unlined portions of the tunnels?

A. No, but in that connection I think it is pertinent to recall that there had been a number of discussions between our engineers and your district engineer, Mr. Boggs, and that Mr. Boggs had had advice from our men as to their intention, their thoughts, their views on this subject, and also at that time that [1100] we had protested to Mr. Boggs and to the District Engineers on the job

(Testimony of Stephen Davidson Bechtel.)

that the methods which were necessary in the setting back of timbers and in the trimming of timbers were contrary to the practice, and was probably unsafe, and was very difficult, was delaying the work, and I believe that that fact was reviewed at some length by our consultants who reviewed the matter with Mr. Boggs in his office.

Q. Now, you made an explanation and you have stated that engineers employed by the contractor had protested in some conference with Mr. Boggs. There was no written protest of any kind or character to the District prior to this letter of August 23, 1935, was there?

A. I believe you are right. I will answer you "Yes", and I might further comment on that point that up to this time, Mr. Tinning, we had been building a tunnel, we thought we were building it for people who wanted a tunnel built and where it would be handled as a construction project, and as the difficulties developed we were being driven to a point by lack of decisions, by the control which was being exercised over your engineers by your Board of Directors, and by your legal counsel, where it was making it very difficult to make progress; it was interfering with our progress, it was interfering with the decisions, it was making the whole project very confused and difficult.

Q. Mr. Bechtel, let us take up one subject at a time. Let us take up the engineers that you referred to, and I assume you referred to the engineers

(Testimony of Stephen Davidson Bechtel.)

mentioned in the next paragraph of this letter, T. L. Phillips and Fred H. Tibbetts; is that correct?

A. Yes, and I believe Mr. Tom Price had also discussed it at some length with Mr. Boggs as a job matter.

Q. Isn't it a fact that the first time that these men whom you had had brought in, Mr. Phillips and Mr. Tibbetts, ever discussed [1101] the matter with Mr. Boggs was on the 8th day of August, 1935? A. I don't know the date.

Q. You don't know? A. No.

Q. When did you employ Mr. Tibbetts and Mr. Phillips? A. I do not recall the date.

Q. It was very shortly before this letter was written, wasn't it?

A. I am under the impression that it was possibly six weeks, Mr. Tinning.

Q. If it was six weeks that would be the outside, and your memory is not clear?

A. My memory is not clear.

Q. You have not examined the records?

A. I have not examined the records.

Q. Then previous to the time—put it six weeks, that would be six weeks back of August 23rd, or about the 10th of July, 1935, you never made any protest of any kind with respect to the design of the tunnel or of the conditions which you had encountered there? A. No, that is not correct.

Q. When did you first protest?

A. The discussion I had with Mr. Boggs, as I told you, or told the Court last Friday.

(Testimony of Stephen Davidson Bechtel.)

Q. Well, that was sometime in April or May?

A. Yes.

Q. You claim that at that time you protested regarding the ground conditions? A. Yes.

Q. Did you protest regarding the tunnel lining?

A. I do not recall.

Q. So the first time you ever protested the tunnel lining was August 23, 1935?

A. You mean in writing?

Q. Yes. A. I believe that you are right.

Q. And the first time you ever protested the tunnel lining, verbally or in any other way, was after Mr. Tibbetts and Mr. Phillips had been employed as consulting engineers by the Six Companies? A. I think you are right. [1102]

Q. Well, that is correct, isn't it? As a matter of fact, isn't it true that Mr. Tibbetts was on the job and inspected the tunnels for the first time early in August, 1935?

A. I don't know the date.

Q. And on the 8th day of August he called on Mr. Boggs and stated to Mr. Boggs, with Mr. Phillips, that the contractor was having difficulty, and that the permanent lining of the tunnel was not adequate, and as a matter of public benefaction Six Companies desired to have the lining thickened?

Mr. Marrin: I think that is improper cross-examination. It is a conversation at which this witness was not present.

(Testimony of Stephen Davidson Bechtel.)

Mr. Tinning: He was president of the company and sent the men there.

Mr. Marrin: He doesn't know what occurred at any conversation that occurred in his absence.

The Court: Ask him if he knows.

Mr. Tinning: Q. Do you know what occurred at that conference?

A. No, but I might comment that I understood that they discussed matters which were subsequently covered in these letters.

Q. Well, as a matter of fact, isn't it true that Mr. Tibbetts and Mr. Phillips reported to you that on the 8th of August, 1935, they had inspected the tunnels and that in their opinion it would be advisable, from the contractor's viewpoint, to thicken the lining? A. I believe they did.

Q. Isn't it a fact that you were one of the members of this executive committee that you told us about yesterday, that all matters of policy and general consideration of the work was referred to?

A. Yes.

Q. You knew when Mr. Phillips and Mr. Tibbetts were employed. Isn't it true shortly after they were employed they came back and told you from the standpoint of the contractor it was advisable [1103] to thicken the lining of the tunnel?

A. Yes, the matter was undoubtedly discussed with Mr. Lawler and with me. The details of the particular conversation and just when it was I do not recall. [1104]

(Testimony of Stephen Davidson Bechtel.)

Q. Now, this suggestion that the lining be thickened came in August, and shortly prior to the date of this letter, and you state that you were advised, you state in the letter that you have before you of August 23, that you were advised on August 19 by Mr. Tibbetts and Mr. Phillips that they thought the installation of the type "A" section endangered the structural safety of the work, the safe operations of ourselves as contractors, and the future safety of the public. They recommend that same be enlarged and strengthened and further reinforced in order to make same an adequate and safe installation suited to the nature of the ground conditions which have been encountered, and for the uses to which the tunnel will be put after completion.

You were discussing then the permanent lining and nothing else?

A. We were discussing the lining, and you say nothing else—I don't know as that would be a proper word.

Q. You were not discussing your timbering, were you, you were discussing the installation of the Type "A" section?

A. This letter refers to the lining.

Q. And you at that time were asking the District Engineer to consider thickening the lining, so that after the tunnel was done it would be safe for the public to pass through. That was one of the elements.

(Testimony of Stephen Davidson Bechtel.)

A. This letter, these discussions and investigations had been made by those men at our instigation; they discussed it with Mr. Boggs, I was not present at those discussions, but this letter was subsequently written to the District Engineer, so that they would have our views in writing.

Q. You signed the letter, didn't you?

A. I presume that I did. I see it is not a signed copy.

Q. You remember writing the letter, don't you?

A. Maybe we can check that letter by looking at the original. [1105]

Q. Is there any question? Don't you remember this letter on this important matter of August 23, 1935, and the contents of the letter?

A. I remember the letter.

Q. There is no question that you signed the letters which is in evidence here?

A. It may be, but as I explained yesterday, there had been several letters sent to you that I was familiar with that I had authorized others to sign my name to.

Q. When you put this letter in evidence last Friday, it was stated it was signed by you.

A. That is conclusive, then.

Q. So that that matter goes out of the question. At this time, one of the matters discussed in your letter was the feature of safety of this tunnel design, and you desired to have it thickened so that the public would be protected and the tunnel would

(Testimony of Stephen Davidson Bechtel.)

not fall down after it was built. That is true, is it not?

A. That was probably one of the reasons.

Q. Didn't the letter say so, in order to make the same an adequate and safe installation suited to the nature of the ground conditions which have been encountered and for the uses to which the tunnel will be put after completion. That is true, is it not, that is what the letter says, and that is what you are referring to, the safety of the public?

A. In that respect, yes.

Q. You also had in mind that under this contract you were required to furnish a completed project to the District. You knew that?

A. That is right.

Q. And if the tunnel lining was inadequate to support the ground after you installed it and before the job was completed, that the contractor might have a liability? You knew that?

A. I presume that I did. However, Mr. Tinning, I think that on that point, it is my understanding that we contracted to build a particular job which was described in the plans and specifications [1106] and the attachments thereto and the references thereto.

Q. Referring now to the geological report?

A. I am referring to the plans and specifications and the contract, and all of the references therein, and if that was a different job, it should be so recognized that the concreting was different, you

(Testimony of Stephen Davidson Bechtel.)

should change your structure, and in that regard you will notice there is a certain pride among men in the construction business to have whatever we do succeed. These firms had combined themselves together and these Six Companies of California had quite a long record of construction. Many of us live around here, we had our homes here, and when we went out there to build a job we wanted to build something that was right; if anything was not right we wanted to call your attention to it for several reasons, one of which was that we lived here and we wanted this thing to be a properly constructed job.

Q. Mr. Bechtel, at the time this letter was written, approximately 1,000 feet of tunnel had been excavated in each of the bores, of which approximately 800 feet in each tunnel had been standing supported on timbers for many months; that is true, is it not? A. That is correct.

Q. And nothing had been done with respect to the actual work of installing permanent concrete lining in these tunnels until after July 1, 1935?

A. No, you are wrong there.

Q. What concreting had been done other than putting in the 92 feet in the south bore, and 110 feet in the north bore, which was completed in November, or early in December, I think the 5th of December, 1934—what concrete was placed in the tunnel after that date and when was the first time that it was placed?

(Testimony of Stephen Davidson Bechtel.)

A. You have a compound question, Mr. Tinning, there. You ask whether anything had been done. To that I would say you apparently fail to realize that in order to get ready to concrete a tunnel [1107] of this type and size there was a lot of preparatory work necessary, particularly where you require the type of work that you want here, which substantially amounted to steel form, and the intricacy or the detail and the exactness to which it had been indicated would be required, we had to be very carefully prepared to do that properly, very carefully and very exactly; and plans had been submitted to Mr. Boggs and, as I understand, they were slow in being returned, there were suggestions, inquiries into certain points, has this been considered, has that been considered, has something else been considered—those matters were considered, and we were getting together our plant and equipment for that operation.

Q. What had been done in the actual placing of concrete in the tunnel prior to July 1, 1935?

A. The portal sections had been completely concreted.

Q. Was any concrete poured in the tunnel after December 5, 1934 and prior to July 1, 1935?

A. I do not believe any had been. However, the records will show that, Mr. Tinning.

Q. Isn't it a fact that there was not any poured?

A. I do not believe so—I believe it is a fact that

(Testimony of Stephen Davidson Bechtel.)

there was none. However, I have not the records to know.

Q. Isn't it the fact that during the month of June, 1935, you were assembling the forms, the steel forms, and the jumbos on the job, that you were constructing and finishing the construction of a concrete aggregate plant, that you were building a concrete bunker, a gravel bunker, a cement bunker, down on the railroad at the Landvale connection, and that you were not ready to pour any concrete prior to the 1st day of July, 1935?

A. I believe that is correct.

Q. And during all of that time as you drove forward in the tunnel you advanced without placing any lining under those timbers? [1108]

A. You mean not concreting?

Q. Yes. A. I think that is correct.

Q. Isn't it true that sometime in the latter part of May you discovered that the timbers had settled in various places into the sections required for placing the concrete lining?

A. The particular date I do not recall, but prior to the time we started to concrete that had been apparent.

Q. Wasn't it about the time that you were talking to Mr. Boggs this conversation that you said you had with Mr. Boggs in April or May, that you knew that you had a considerable amount of timber which had settled or moved so that it was inside

(Testimony of Stephen Davidson Bechtel.)

of the sections or the area where you must place your concrete?

A. I do not have a recollection of that knowledge at that time.

Q. When did you first learn that?

A. I believe that it was—

Q. Approximately.

A. I believe that it was at the time we were getting ready to set up the concrete forms in the tunnel, and approximately the same time, too, that Mr. Phillips and Mr. Tibbetts were employed, and, incidentally, they were employed after your letter to us of approximately June 12, turning down our application for an extension of time.

Q. Just so the record will be clear, that is July 12?

A. July 12.

Q. So that we have now in your recollection Mr. Phillips and Mr. Tibbetts were employed sometime after July 12? A. Sometime in there.

Q. And you think it was about that time that you discovered that the timbers, a large number of the timbers were extending into the concrete section?

A. I think so.

Q. So that that timber had been in, some of it, some of the timber that was placed in January had been in six months at that time, or more?

A. Yes. [1109]

(Testimony of Stephen Davidson Bechtel.)

Q. And the timber that had been placed in December had been in seven months or more at that time?

A. If it was placed in December it would have been in seven months.

Q. Now, isn't it true that when you discovered this you knew that you would have a difficult and hazardous task to reset the timbers, that is, move them back, so that you could have the place to put in the specified concrete lining? A yes.

Q. You also knew at that time that it would require a considerable amount of concrete to fill the space between the timbers? A. Yes.

Q. You also knew at that time that the District Engineer would require you to build the tunnel in accordance with the plans and specifications, and not permit timbers to intrude into the section required for the concrete lining under the plans and specifications?

A. As this matter was developed, and it became apparent—

Q. Will you answer "Yes" or "No," and then explain? Did you know that the engineer was going to require you to build this tunnel the way it was specified?

A. Yes, exactly the way it was specified.

Q. He was not going to permit the timbers to intrude into the concrete section, you knew that, too? Will you answer that "Yes" or "No"?

A. No.

(Testimony of Stephen Davidson Bechtel.)

Q. You did not know that?

A. No, because I will tell you the reason why, because there was a discussion, as I understand it, between Mr. Price, as reported to me by Mr. Price, that at first a quarter of an inch intrusion would be permissible, a ridiculously small amount in a tunnel of this type and character, then it was increased to half an inch, and then to an inch, and the discussions went on there, we were endeavoring to get a practical application to take care of a very difficult situation, and basing our suggestion and our requests on a lot of experience that Mr. [1110] Lawler had had, 30 or 35 years in tunnels up and down this western country, and they had never had a condition as unnecessarily stringent as this was. We were endeavoring to get a practical application and none was given. As I say, we considered your quarter of an inch tolerance, later half an inch, and then an inch, ridiculous. We were endeavoring to get a practical application. We called in Mr. Tibbetts, we called in Mr. Phillips, who were engineers, who had done a lot of work, and in so doing had interpreted for the owner as engineers in their professional positions, interpretations of what is practical, and when specifications are made we, as contractors, think that they are going to be interpreted practically, not with a definite legally interpreted application. There is a great difference between building a tunnel under a technical legal interpretation and under a practical engineering in-

(Testimony of Stephen Davidson Bechtel.)

terpretation, and I just want to comment, if all tunnel construction or construction has to be done under a very technical legal construction, it requires a vastly different condition to work under than is common and accepted practice.

Q. Mr. Bechtel, before you bid on this job you read the specifications, didn't you? A. Yes.

Q. And you remember the section with respect to timbering, overbreak, which required you, which said in no event is the timber that is installed to be permitted to extend into the section required for the concrete lining, a 2-foot neat section at the top and 5 feet at the bottom? Do you remember that?

A. Substantially, yes.

Q. When did this conversation with respect to permitting the timber to intrude, or what you call tolerance, that, as you say, Mr. Price had, first a quarter of an inch, and then half an inch, and then an inch, in what month did that occur?

A. When we were [1111] getting ready to start concreting, when it became apparent that the timbers had settled to a point that there was a substantial—

Q. (Interrupting) You said that was about the 1st of July, as I remember it.

A. Somewhere around there.

Q. As a matter of fact, it was ultimately determined in this tunnel that it was necessary because the timbers had intruded to modify the sections to the extent of 10 inches, was it not?

A. That is correct.

(Testimony of Stephen Davidson Bechtel.)

Q. But at the time referred to, prior to the disaster of August 28, 1935, the District Engineer had advised Mr. Price that it would be necessary for him to set back the timbers so that he could build the section the way the plans and specifications called for, had he not?

A. With extreme exactness, and in my opinion unnecessary exactness, and contrary to practice, and contrary to what reasonable engineering would require.

Q. You think it was reasonable engineering to permit the timbers to intrude into the concrete in violation of the specifications?

A. It is accepted practice, Mr. Tinning; it is a question of degree.

Q. Isn't it a fact that at this time in July you were seeking to permit the timbers to intrude into the section, which would cut down the amount of concrete in the arch? You can answer that "Yes" or "No," and then explain.

A. Yes. A request was made, and it was pointed out, and I believe particularly by Mr. Tibbetts and Mr. Phillips, that there was considerable additional concrete between the timbers that would more than compensate for an encroachment of the timber, and particularly in this case, where the removal of these timbers would cause a real hazard, would slow down the progress, would interfere with the progress of

(Testimony of Stephen Davidson Bechtel.)

the work, and would cost a great deal of additional money. [1112]

Q. Mr. Bechtel, there is nothing in this letter about intrusion that we are talking about. I would like you to answer my question. I do not think you understood it. I was referring to these requests that you say were made verbally of Mr. Boggs and denied by him to permit timbers to intrude into the designed concrete lining section, and I asked you if it was not true that that would weaken the arch to the extent of the intrusion? A. No.

Q. It would not? A. No.

Q. That is your engineering opinion.

A. No

Q. Is that your engineering opinion? Will you answer that question? Is that your engineering opinion that the intrusion of the timbers into the designed section would not weaken the arch? Will you answer "Yes" or "No," please and then explain?

A. No; under the conditions that this job had to be built and was built, there was considerable additional concrete outside of the so termed minimum section which more than compensated for the intrusion of timber in the minimum section described.

Q. They had to put that in, anyway, to fill up the space between the timbers?

A. Not necessarily, no.

Q. What would you put in there?

(Testimony of Stephen Davidson Bechtel.)

A. One could have back-filled it, back-packed it with timber, with rubble, with gravel, as was done elsewhere in the tunnel.

Q. Between the timbers, back-packed with rubble?

A. Yes, the specification permitted that.

Q. It did? A. Yes.

Q. That is your opinion?

A. That is my recollection.

Q. You were trying to have the timber intrude into the section in the latter part of June and in August you wrote a letter in which you stated you thought that the section was weak and that it ought to be thickened, and that the public would suffer because it might fall down on them if you did not make it thicker? How [1113] do you reconcile those two positions?

A. Mr. Tinning, you are putting a wrong construction on this matter, and you are reading into it things that are not there. You are confusing the issue, I think, Mr. Tinning.

Q. I will have to take the responsibility for that, Mr. Bechtel. I would ask you, though, if it is not a fact in your letter of August 23rd you were seeking to have the district strengthen the arch by thickening it and make some other changes which would require the placing of more concrete and more steel in the arch than the A section which was called for in the specifications provided for? That is what this letter was seeking to do, was it not?

(Testimony of Stephen Davidson Bechtel.)

A. This letter was writen August 23rd; this letter was written after our engineers had made a careful study of this matter.

Q. Will you answer my question, please? I ask you if it is not a fact that by this letter of August 23, 1935, Six Companies were seeking to have the district thicken the arch and add steel, and strengthen the permanent concrete lining?

A. Yes, but this letter was written at a subsequent date. The discussions which I spoke of were made in an effort to expedite this work, and make it safer, and make it more economical, and this came as a result of an engineering study made by Mr. Tibbitts and Mr. Phillips.

Q. Which would have resulted if they had adopted your suggestion in the addition of concrete to the arch, additional steel, and a new design, that is, a strengthened arch—that is what you were seeking, so that it would not fall down on the traveling public: isn't that the purport of this letter?

A. Well, you have got about five questions in one, there.

Q. Then we will break them up into one, if you cannot understand that one. Were you trying to increase the thickness of the de- [1114] signed section?

A. On the recommendation of our consulting engineers, Mr. Phillips and Mr. Tibbitts.

Q. Were you trying to strengthen the design of the section, Type A? A. Yes.

(Testimony of Stephen Davidson Bechtel.)

Q. And in July or the latter part of June you had been delayed by the intrusion of timber, and now you state at this time on August 23, 1935, that "Under these circumstances"—that is, that the design was weakened, that it was likely to fall in or cause damage, that you would proceed with the installation of type A section of concrete under protest and upon notice to you as above stated; and we further hereby notify you that we do not assume any liability or responsibility for the safety or adequacy of any such installation, but, on the other hand, we will proceed with such installation only upon the condition that full liability of any kind, civil or criminal, which may arise from or be caused by installation of same be assumed by you. That is true, is it not? A. Apparently.

Q. Apparently. You wrote it, didn't you, and you told us in that letter that you would proceed under protest, and if it fell or anything of that kind we would be responsible and not you. That is true, is it not? A. Yes.

Q. And your contract stated that you took all risks in constructing that tunnel and delivering it as a complete job to the district.

A. That is what it said, the tunnel as originally contemplated and specified.

Q. And we were talking about the tunnel originally contemplated in this latter, section A lining.

A. That is correct, but when you talk about our assuming responsibility under our contract, if we

(Testimony of Stephen Davidson Bechtel.)

were to build something contrary to our contract we did not want to be held responsible for it.

Q. But your contract provided that you were to build A section 2 feet at the top and 5 feet at the haunch?

A. To meet certain condi- [1115] tions, yes.

Q. That was your contract, and you now say that you would proceed under your contract, but that you disclaim any liability; that is true?

A. That is true, Mr. Tinning.

Q. You wanted another lining than the one that was called for in the contract?

A. I was speaking here——

Q. Will you answer that question "Yes" or "No,"——

Mr. Marrin: Let the witness answer the question. He is doing his best to answer the question.

Mr. Tinning: Q. Will you answer my question and then explain? Will you read the question?

(Question repeated by the reporter.)

A. I recommended another lining.

Q. That is what you said in this letter?

A. We recommended another lining to take care of the different conditions that had developed, that had become apparent to us, following the recommendation of our engineers.

Q. Under your contract, in addition to the type A section there was a provision for a type B section, an invert, which was in effect a circle, a barrel, which you agreed to do, that work, the B section, at

(Testimony of Stephen Davidson Bechtel.)

a different and higher price than the A section. That is true, is it not? A. Correct.

Q. And under the terms of your contract the District Engineer had the right to have that Type B section installed in any place in this tunnel where, in his judgment, it was necessary to meet the conditions encountered, heavy ground or other conditions, that appeared in his judgment that required it?

A. That is true, but——

Q. Just a moment.

A. I want to explain my answer there. I say yes, my answer is that he had that right. However, if it varied substantially from the quantity involved, say instead of saying 200 feet there were 4,000 feet of type B, it would not have been the same [1116] contract, nor what was contemplated.

Q. In other words, you interpreted the plans and specifications so that the District Engineer was limited as to what he wanted to put in?

A. That is my understanding of the interpretation which has been placed on that in other cases, or in other instances where radical quantity variances have existed.

Q. Regardless of that——

A. (Interrupting): And that has been our experience, Mr. Tinning.

Q. That has been your experience? A. Yes.

Q. Mr. Bechtel, if the specifications show as a matter of fact that the District Engineer could have placed the whole approximately 6,000 feet of these

(Testimony of Stephen Davidson Bechtel.)

tunnels under the B section, you would not say that you were not bound to do it under your contract, would you? You would be paid for it under the contract price you bid, would you not?

A. I don't know, Mr. Tinning. I think that would be a very moot question whether you would. That is a legal question that I would probably have referred to our counsel for advice.

Q. You would have been paid more for that, you knew, if you did more?

A. That is correct, and if a practical amount of it, not taking the entire project.

Q. We are only asking for your opinion of what you did. A. You did ask my opinion.

Q. You did not put any in, did you?

A. Not as such.

Q. You did not put any in, at all, did you?

A. Of Type B, as such?

Q. Yes. A. No.

Q. You did not put any in at all, one foot of it, did you? A. Of Type B?

Q. Yes. A. Technically speaking, no.

Q. You put in Type A and nothing else?

A. No, we put in Type A, but we put in a great deal more than type A.

Q. Referring now to the material that you put in outside of the [1117] neat section required by the plans and specifications?

A. Partially, yes, but I believe that point will be developed a little later by other witnesses who are in a better position to discuss that point than I.

(Testimony of Stephen Davidson Bechtel.)

Q. What are you referring to? There is no mystery about this. You had to put in a section, Mr. Bechtel, which was two feet thick at the top and five feet at the bottom, and you had to fill in the over-break, and you had to place concrete or grouting or rubble or lagging outside, according to the specifications, and one foot had to be solid concrete. You knew that under the specifications, didn't you, the over-break?

A. No, I do not recall that.

Q. And concrete between timbers?

A. I do not recall that.

Q. You do not recall that? A. No.

Q. At any rate, under your contract, you had to build this tunnel in accordance with the design with two feet thickness at the top and five feet at the bottom, and you were complaining as it developed in these letters that you had to put in a lot of extra concrete. Are you familiar with the provisions of paragraph (b) of Section 32 of the specifications?

A. I was familiar with them, but I am not familiar with them at this time.

Q. Let me refresh your recollection in view of this testimony: "Any excavation which, due to requirements of timbering"——

Mr. Smith: What page is that?

Mr. Tinning: It is page 59. It is the paragraph in the right-hand column, the second paragraph of paragraph (b), over-break, Section 32 of the plans and specifications which are in evidence:

(Testimony of Stephen Davidson Bechtel.)

"Any excavation which, due to requirements of timbering or the nature of the material, or caused by over-breakage, extends more than one foot from the outside neat lines of the concrete structure, may, at the option of the contractor, in lieu of replacing with the structural concrete specified, be fi ed to within [1118] one foot of said neat lines of concrete with spalls, boulders, or other material approved by the District Engineer and grouted i with a cement grout consisting of one part of cement to three parts of fine aggregate and applied as directed by the District Engineer and to his satisfaction. Such construction, however, shall not be permitted within the one-foot space outside of the neat lines of the concrete structure, and such space shall be filled only with Portland cement concrete mixed in the same proportion and placed at the same time as the structural concrete, provided that if steel liner plates or ribs are used and are allowed by the District Engineer to remain in place, the spaces back of plates and ribs shall be dry packed and grouted as provided, but any space between the plates and the neat lines of the structure shall be filled with concrete at the same time as the neat structure."

Did you have that provision of the specification in mind a few moments ago when you said you were doing more than your contract provided in filling in spaces between the neat concrete sections

(Testimony of Stephen Davidson Bechtel.)

and the spaces outside of the excavation? You knew you had to fill it one foot in concrete, under these specifications, didn't you?

A. No, I don't think it says that, Mr. Tinning.

Q. We will go on with the letter of August 23. I am referring to page 2:

> "In view of our conclusion above expressed, we shall feel free to discontinue the further installation of this type section unless within reasonable time after receipt of this notification to you, you alter the design of the section to meet the objections thereto, or notify us in writing that you assume all responsibility and liability of any kind or character, civil or criminal, which may arise from the installation of same."

This was your letter of August 23rd, and it contains an ultimatum [1119] unless we change the design, the District changes the design, that you will cease work or that we must write you as a condition of going on that we assume full responsibility, civil and criminal; it is true you made that statement in that letter, didn't you?

A. That is what it says.

Q. "We are not now excavating in the headings of the tunnels on either the easterly or westerly end thereof; and we do not believe it wise to resume excavation therein until such time as you advise us whether or not you propose to alter or modify type A tunnel construction, as in the event a change is made in same,

(Testimony of Stephen Davidson Bechtel.)

the excavation can be made to conform to such altered design."

Now, Mr. Bechtel, giving consideration to that paragraph, you had approximately at this time, say 900 feet, somewhere in the neighborhood of that, of excavated tunnel supported on timbers in each of the bores which had been excavated, Type A section, which had been excavated under the method that you adopted to drive these tunnels, you say you had stopped work at this time for the purpose of seeing whether the district would permit you to install some other design, thicker design, heavier, stronger design; what did you propose to do with the 800 or 900 feet of tunnel which was timbered and designed to take the A section and which at that time you knew, in which area you knew the specifications required you to put in your A section —what did you propose to do with that 800 feet of tunnel?

A. That was a subject for a conference between our consulting engineers and the District's engineer. [1120]

Q. What did you intend to do?

A. I was not present at the conference; we referred that to men who knew more about designing than we did.

Q. You wrote this letter; you must have known what you intended to do?

A. No; I do not recall.

Q. You do not recall? A. No.

(Testimony of Stephen Davidson Bechtel.)

Q. You do not know what you were going to do with 1800 feet of tunnel, or thereabouts, in which there was just these concrete rings and a little work which was started in July,—I think Mr. Larson said about two or three hundred feet in the two tunnels; you were going to have to—if you made those tunnel linings thicker, you were going to have to move all that timber back, reset it, or else make a smaller tunnel?

I do not recall that, Mr. Tinning; but I do presume that there would be other ways of accomplishing the same situation, by substantially increasing the quantities of reinforcing steel, putting in a slab in place of an invert, increasing the thickness of the slab, or increasing the member at the lower portion of the ventilating chamber in thickness, and reinforcing that with reinforcing steel or structural steel, so that you would have the same—you could accomplish practically any designing in that manner —I am presuming, now, you understand; but, as I say, that was a matter for engineering study, which had been made by Messrs. Tibbitts and Phillips, who in turn discussed it with your Mr. Boggs.

Q. Were you planning, at this time, Mr. Bechtel, to have the tunnel take the shape of a vermiform appendix, with one part of it at one size, and then a bigger, thicker tunnel in the other part——

A. I don't know some of the words you are using.

Q. Well, I am sorry. I thought, from this letter, you might understand it. You were planning, were

(Testimony of Stephen Davidson Bechtel.)

you not, to make the tunnel [1121] smaller in this portion where the timbers were?

A. I was not planning anything; we had some consulting engineers whom we had confidence in, and we subsequently discussed it with Mr. Boggs, and also, I believe, we discussed it with the Department of Public Works, with the PWA men in the Bureau of Public Roads; but, in direct answer to your question, I do not think it was contemplated to make any substantial change in the shape or thickness or clearances of those tunnels; and, further, from my understanding, my recollection, that it could be accomplished without affecting those matters seriously at all.

Q. At the time you were seeking to have the District modify the design of this "A" section, because you said the ground conditions were bad, you also thought the District could not require you to install the "B" section which was designed for extremely heavy ground?

A. If I said they could not require us to do it, the words did not truly reflect my thought. I think they could ask us or require us to do so; but it would change the basis of compensation to us, because it would then be a different job than we contemplated, which would entitle us to an extension of time and to an equitable, reasonable, fair price, as determined by the proper parties.

Q. Are you talking now about "B" section, or are you talking about this modified section that you

(Testimony of Stephen Davidson Bechtel.)

were hoping to get, under your letter of August 23rd?

A. I thought I was talking about the subject you asked for, namely, "B" section.

Q. You are testifying now, as president of Six Companies at this time you assumed if the District ordered you to place "B" section in these tunnels in accordance with your bid at the bid price, that it would be a modification of the contract, and that you would be entitled to a change in compensation and would be entitled to equitable relief?

A. If it was a substantial change. [1122]

Q. What do you mean by "substantial"? I am talking about "B" section just as it stood in the specifications.

A. You refer to going from 200 feet to 6000 feet, or 5820 feet. If you did that, I would personally be of the opinion it would be a change in the contract and as a matter of law—Well, you know better about that than I.

The Court: We will take a recess.

(Recess)

Mr. Tinning: Q. Mr. Bechtel, if I understood you with respect to the "B" section, in your previous testimony, you considered at the time you wrote this letter of August 23rd, that the District Engineer could not order the "B" section placed in the tunnel to any substantial extent beyond 200 feet, the quantity that was set up in the bid sheet as an

(Testimony of Stephen Davidson Bechtel.)

estimate on the quantity for bidding purposes; is that a fair statement?

A. No. I think he could order the entire section put in; but, if he did order the entire tunnel put in, in Section "B", if he substantially varied from the quantity indicated there, then a proper adjustment, a proper determination, should be made in that. Now, let me elaborate just on that——

Q. Well, before you do, may I ask one thing? You say "a proper adjustment." That is, you would be paid more money than your bid price; is that what you mean—on the "B" section?

A. If that is indicated that that was the proper thing to do.

Q. Well, I am asking about the contract provision.

A. Well, I don't know it as a matter of contract. Any contract is subject to interpretation of law, I presume. I believe, while I am not an attorney—but the experience that I have had in years gone by—I think if there is a substantial variance in quantities—I am not talking of a 5 or 10 or 20 per cent variance—but, if you [1123] get a substantial variance, then an equitable adjustment of the contract should be made for that, if it substantially increases the cost of the job, because of it. At no time, did we endeavor, or want to, or refuse to construct this job in accordance with the wishes of Mr. Boggs. It was not our desire to say we would not build any number of lineal feet of Section "B";

(Testimony of Stephen Davidson Bechtel.)

but, when you speak of the amount we could be required to, under the contract, I think we were required to put it in, but the compensation would be a subject that would be another matter.

Q. In other words, after your explanation, you believe that, if you had been required to put in 1000 feet of Section "B," that you would have been entitled to receive from the District something more than the price per foot for "B" section that you bid and which was written into the contract?

A. That cannot be answered "Yes" or "No"; I don't know whether 1000 feet is "substantial"; it may or may not be; and, if it increased the cost, then we would probably be entitled to that; but that is a legal question.

Q. Well, if it all had been ordered in, the entire 6000 feet of tunnel in "B" section, do you think that that would have entitled you,—the Six Companies would have been entitled to any more money than the price that you bid on "B" section and signed a contract to construct it for?

A. I cannot answer that "Yes" or "No"; it depends upon the conditions; it depends upon the cost.

Q. In other words, you would not be bound by your bid if it cost more than the bid?

A. My understanding is that we would be entitled to a proper accounting and proper adjustment for the increased quantities beyond a reasonable portion. That is a legal question. I am

(Testimony of Stephen Davidson Bechtel.)

just a contractor. You know all the answers to these things .

Q. Thank you, Mr. Bechtel. You think, if it cost more than the [1124] bid price, you would be entitled to compensation. Did you also consider, when you were giving thought to the problem, that, if it cost you less than the bid price per foot for "B" section, you would give something back to the District?

A. I don't know as I gave it any consideration.

Q. You did not think about that?

A. Your point here is not that question; it is if we considered, in writing the letter; but the bid was another point.

The Court: Don't occupy any time upon the basis of giving anything back.

Mr. Tinning: Well, I didn't want to be misled, your Honor.

Q. Mr. Bechtel, I would like to refer you and read to you, in view of your testimony about "B" section, paragraph "B" of Section 1 of the specifications, which appears on page one:

> "Estimates of Quantities. Where estimates of quantities are given on the Proposal Form, or in 'Notice to Contractors,' or in any contract executed hereunder, it is hereby declared and shall be understood that such quantities are approximate only, being given as a basis for comparison of bids. The District does not expressly or by implication agree or guarantee

(Testimony of Stephen Davidson Bechtel.)

that the actual amount of work will correspond therewith, but reserves the right to increase or decrease the amount of any class or portion of the work, or to omit portions of the work as may be deemed necessary or expedient by the District Engineer."

You had that in mind,—that provision,—when you bid, didn't you? A. Probably did.

Q. Well, you did, didn't you; you read the specifications? A. We read the specifications.

Q. With respect to the liability of the contractor, in your letter of August 23rd you said, if you proceed, the District will be civilly or criminally liable for any of the difficulties you had. [1135] I will refer to Paragraph "K" of Section 6 of the Specifications, which appears on page 6:

"Contractor's Liability: On all work the Contractor is to assume all liability of every kind or nature, arising from said work, either from accident, negligence or any cause whatsoever during the progress of the work and before the final acceptance thereof, and shall indemnify and hold the District harmless therefrom, and the bonds given by the Contractor shall hold and secure the said District free and harmless from any or all damage or expense whatsoever."

Did you have that section of the specifications in mind when you wrote this letter in which you

(Testimony of Stephen Davidson Bechtel.)

stated that you feared that the permanent lining that you contracted to build might cause you cost or expense during the time you were constructing the remainder of the tunnel?

A. I do not recall that; but we probably did. Now, on that point, in explanation of that point, I want to point out that we were advised verbally—I was, by Mr. Tibbetts, that the hazard of constructing type "A" in that formation that had been encountered up to that time, and particularly where we started to set the timbers back, was a real hazard, and that there possibly was criminal responsibility involved, and that we should be very careful, we should check that point and do everything we could not to make ourselves involved, not to get ourselves involved at least knowingly in a situation where there might be liability.

Q. Now, Mr. Bechtel, your letter was referring to the permanent lining; and on the matter of setting the timbers, you selected your own method of setting the timbers, and you found, at this time, that you had to set them back, and you were worried about the results that were involved in that, but that had nothing to do with your permanent lining or strength of it?

A. Well, Mr. Tinning, [1126] it did, in this way: as this tunnel was driven, the timber was set back a certain distance,—if I remember properly, about 3 inches outside of the neat lines; that is customary in driving the tunnel, because you expect it to take

(Testimony of Stephen Davidson Bechtel.)

some weight, to take some weight; and, instead of taking a nominal amount of weight which we expected as the tunnel progressed, it took a substantially larger amount of weight, greater weight; that was a condition which became apparent, and we addressed a letter—After we had these engineers,—Mr. Tibbitts and Mr. Phillips,—review the matter, they pointed this matter out; so that, at that time, we began to get considerably concerned over it,—over the hazard of setting the timber, trimming the timber, and the responsibility for it, and the effect of the weight it would have to stand; and it was after our discussions on the matter with Mr. Boggs, and endeavoring to avoid a lot of legal actions, et cetera. In any construction job, these changes come up; there are changes made, and the engineer sits down with the contractor, and the contractor sits down with the enigneer, and the engineers usually don't have the advice of a lot of counsel, and the whole thing is done as a matter of equity and a matter of construction procedure.

Now, what happened here when we started to proceed? We tried to follow it through in that way; but we could not do it. Why couldn't we do it? Because there was a board of directors and because there was the District's attorney,—Mr. Tinning,—you; and you would not, in my opinion, permit things to go along in a normal way, which interfered with our progress; and that was one of the

(Testimony of Stephen Davidson Bechtel.)

causes of the delay; and it became more apparent as time went on.

Q. Mr. Bechtel, I seem to be the point of your remarks at this moment. In other words, because the District required you to build the tunnel in accordance with the plans and specifications in your contract,—the contract entered into by the Six Companies that you [1127] have told us about, and their constituents of long experience—because this District desired you to build it in accordance with the plans and specifications, you think the District was inequitable?

A. No; but I do say that, when you get a condition where the District's Engineer is not going forward in an engineering way, not making decisions and delaying decisions because of necessity of discussing it with a board of directors and discussing it with the District's attorney, you affect all of the secondary effects of this thing and delay the thing, and affect the construction of the job; then it is serious; and we tried for months and months and months to carry this thing as a construction procedure; we tried, with our consulting engineers—they had their discussions with Mr. Boggs, as Mr. Boggs will undoubtedly in due time testify, and they did not get any place at all; and, secondly, long discussions about getting approval from the United States Government, from the PWA people, from the Reclamation people.

(Testimony of Stephen Davidson Bechtel.)

Q. If you have thoroughly relieved your mind, let's get back to the question.

A. Well, I think it is very pertinent to this project; it has a very definite effect upon the progress of this work.

Q. I am going to ask you if there is one word in your letter of August 23rd respecting the resetting of timbers. Your whole letter is directed to the design of the finished section, is it not, which you desired to have modified?

A. I think that is correct. May I see the letter?

Q. There isn't any question about that, I think, Mr. Bechtel.

A. I think you are right.

Q. What you have been telling us about is the question of resetting timbers, putting them back,—that is what Mr. Tibbetts told you was dangerous; he did not tell you the design was dangerous, did he? A. Yes, he did. [1128]

Q. He did? A. Yes.

Q. Well, what did the thickness of the design have to do with resetting timbers?

A. Well, the thickening of the design for the area ahead there, which, as I understood it, was recommended to your District Engineer.

Q. What did it have to do with resetting timbers?

A. In the area, in the matter of resetting timbers——

Q. Was there anything regarding timbers in the letter of August 23rd?

(Testimony of Stephen Davidson Bechtel.)

Mr. Smith: Just a moment. Let the witness finish.

Mr. Tinning: The witness answered everything but the question.

Q. Mr. Bechtel, was there anything in this letter of August 23rd, 1935, that had to do with the resetting of timbers, that was not mentioned? You have mentioned it twice here—that was not mentioned there. You are talking about the permanent design of the permanent arch?

A. I presume——

Q. Will you answer the question "Yes" or "No',' and then explain?

A. You said I mentioned it twice; but, in writing a letter, it seems to me that you must consider the conditions which lead up to it and the condition subsequent thereto, to get the true reflection of the letter.

Mr. Tinning: We ask the answer of the witness go out as argumentative.

Mr. Smith: I submit the answer was called for. I think it is a proper explanation.

The Court: Let's proceed, gentlemen.

Mr. Tinning: Q. Mr. Bechtel, you stated that you thought that you would have extra compensation if you had to put in "B" section in any substantial amount above 200 feet?

A. Let me correct you. I don't think I said that: that it was contemplated in any [1129] particular amount. You asked the question if it was increased,

(Testimony of Stephen Davidson Bechtel.)

if the whole tunnel was put in "B", would we then be entitled to increased compensation; and I say "Yes."

Q. I will read you the provisions of Paragraph "G" of Section 32 of the Specifications now in evidence, which appear on page 61:

> "Types of Tunnel Section: Two typical tunnel sections are shown on the plans. The District Engineer shall determine which section shall be used in any specific location in order to meet varying conditions which may be encountered. In general, it is expected that the Type 'A' section will be used throughout the major length of the tunnels, but if conditions arise which, in the judgment of the District Engineer, require the use of Type 'B' section, the Contractor shall make such modifications in construction as may be necessary."

You knew about this section when you considered this portion of the specifications, did you?

A. I presume I did. Yes, I read the specifications.

Q. As a matter of fact, the entire tunnel constructed by Six Companies up to the time they abandoned the work and quit the work and constructed by the other contractors who finished the work was constructed of "A" section, was it not?

A. I do not think any of it was constructed that way.

(Testimony of Stephen Davidson Bechtel.)

Q. In other words——

A. It was a modified "A" section that we placed in it, the details of which I cannot give you; but the conditions, the details of the construction, possibly were beyond, were outside of the "A" section neat, as specified in the plans.

Q. You were paid the monthly estimates on the "A" section, in accordance with your contract, for a period of approximately 15 months, and you never protested those payments?

A. There were some of the quantities that were protested; but substantially I should say [1130] it is correct.

Q. And the tunnel is there; the "A" section, for which you received these payments that I have referred to, is now standing up and being used by the public; that is true, isn't it?

A. It is standing up and being used by the public.

Q. And it was accepted by the State of California, and approved for acceptance by the United States, before it was turned over for public use?

A. I presume that is correct. [1131]

Q. Yes. Mr. Bechtel, I will hand you Plaintiff's Exhibit No. 49, in evidence, the letter which you wrote in behalf of Six Companies to the District, and delivered on August 28, 1935. There is one matter I have not gone into in detail in the letter of August 23rd, and which I would like to return to. You had in mind at the time that you were seeking

(Testimony of Stephen Davidson Bechtel.)

to modify the section that you referred to, strengthening the section, Section A, the same modification that if that was done the contractor would receive extra compensation for extra materials that were put into that section?

A. Our concern was to build a proper tunnel, and the matter of what the compensation would be would be determined in due time in a proper manner, and by a proper procedure, which had been discussed and was discussed immediately subsequent thereto, if there was any extra compensation we were entitled to, that would be determined. I think that I discussed with you and with your board our willingness to arbitrate any matters that were then existing, any controversy, and to submit the thing to any impartial people that would reasonably review the matter as to what the compensation would be; that that would be a matter of subsequent discussion and a matter of subsequent determination. What we were interested in doing was building that tunnel properly, to go right through and get the job finished, so that the job could be completed at the earliest practicable date, and that was our purpose and continued to be our purpose, and we worked right up to the time we were driven off the job with that purpose in mind.

Q. And at the time that you wrote the letter of August 23, 1935, will you say that you did not have in mind seeking additional compensation for additional work, labor, or material that was required in

(Testimony of Stephen Davidson Bechtel.)

the extra concreting that you desired to put into this arch?

A. I would say that I had framed the letter——

[1132]

Q. Will you answer "Yes" or "No," and then explain? A. I may have.

Q. You did have, didn't you?

A. I don't recall whether I had or not.

Q. Were you going to do it for the bid price?

A. That would be a matter of proper negotiations. I do not recall all of the circumstances surrounding the consideration. In discussing that letter, as you will remember, there were discussions going on at that time, and we were gravely concerned over the situation, I put hour after hour, and day after day, and night, going over the matter, not only myself, but in collaboration with Mr. Lawler and consulting engineers.

Mr. Tinning: I will ask your Honor to admonish the witness not to state things which are not responsive to the question. I asked a specific question.

Mr. Marrin: We submit the answer is entirely proper. He has gone on to explain his interpretation. He has a right to state what was in his mind.

The Court: I will allow it to stand. Proceed.

Mr. Tinning: Q. Did you expect extra compensation for extra work or material that might be required in thickening the arch?

A. I didn't know whether there would be extra compensation.

(Testimony of Stephen Davidson Bechtel.)

Q. Then is it your testimony that at the time you wrote this letter on August 23rd that you had no expectation of extra compensation if the District authorized the Six Companies to thicken that arch and modify the design?

A. I didn't know whether we were going to get extra compensation or not. We were endeavoring to have this thing done properly, we were endeavoring to follow out the advice of our engineers.

Q. You did not expect any extra compensation for what you proposed to do?

A. I did not say that. [1133]

Q. I asked you did you.

A. I say I didn't know whether we would get extra compensation or not, realizing that it would be decided on its merits in due time.

Q. What do you mean, by litigation, or arbitration, or what? A. We hoped for arbitration.

Q. In other words, you hoped to modify the design and then seek to get your claim paid, your claim for extra work?

A. If it developed in the final analysis that the costs were different, that the job was different, in fact, if there was merit in it, in fairness we would expect extra compensation; on the other hand, if it was found by an arbitration board or by a court, as you put it at ne time, of competent jurisdiction, it was not the case, we would not expect it, but we did want to build it properly, we wanted to build it expeditiously and economically.

(Testimony of Stephen Davidson Bechtel.)

Q. You wanted to get the concrete that you were putting in this one foot or more outside of the neat section, put inside the section where it became a paying quantity? A. Not necessarily.

Q. But outside it was not?

A. Not necessarily it was not. The recommendation of the Six Companies of California came in the form of discussions of our consulting engineers with your engineers; they are familiar with that; they will tell you that in due time, or I will get it for you if you would like to have it.

Q. We are interested in some 100 exhibits we have here now. We will now proceed. You have a copy of the letter of August 28, 1935, addressed to the Board of Directors, and this is already in evidence as Plaintiff's Exhibit 49, in which you refer to the contract which you entered into with the District, and state that

> "The parties intended, and the contract and documents above mentioned forming a part thereof, and the geological report, contemplated that the two tunnels included [1134] within the contract would be excavated through ground which was represented to be and would be found to be self-supporting for nearly the entire length of the tunnels."

Now, Mr. Bechtel, that is the first time in writing that the Six Companies ever advanced the claim to the District that the geological report indicated you would have self-supporting ground through the ma-

(Testimony of Stephen Davidson Bechtel.)

jority of the tunnel—that was the first claim that was made in writing, was it not?

A. I believe that is correct.

Q. And this was approximately more than fourteen months, I would say it would be fair to say fourteen months, approximately, after the work under the contract was commenced and it was the first time you ever claimed that the geological report had misled you; that is true, is it not?

A. Apparently that is correct.

Q. During which time you had driven some 2,000 feet of tunnel, 1,000 feet in each bore, you had built a large part of the outside work, and you had received something in excess of a million dollars in payment from the District. That is true, is it not?

A. I do not recall the figures, but if you say so I will concur with you.

Q. That is generally true. You say then that

> "The design and the plans and specifications call for the installation of Type A tunnel construction for 5620 feet of the total length of tunnels. We notified you in our letter to you dated August 23, 1935, that Type A tunnel construction is unsafe and inadequate for installation in the entire length of ground thus far encountered in the tunnels."

In other words, that you wanted to put in some other kind of lining in the tunnel; you are talking about the permanent lining. That is correct, is it not?

(Testimony of Stephen Davidson Bechtel.)

A. The permanent lining, and also, I think, one would have to consider in reading that paragraph the preparatory work to the construction, prior to the permanent lining, but that is an incidental point.

Q. You desire now to testify that that paragraph should also be [1135] interpreted to include a reference to timbering and the work of re-setting?

A. I think in being read it should be kept in mind that other matters are affected, are to be considered.

Q. You have told us that before. Now, we refer to paragraph 4 of the letter:

> "The character of ground encountered thus far in the excavation for the tunnels, with but slight exception, has been and is entirely and radically different from the character of ground represented to the contractor as that which would be encountered, and is likewise radically different from the character of ground which was contemplated by the specifications, as is apparent from the terms and conditions set forth therein. By reason of this fact we have been required to do additional work, supply additional materials, and have been put to great additional cost and expense not contemplated or intended by the contract, and not intended to be borne or assumed by the contractor in the construction of the tunnels. You are hereby notified that we, as contractor, now do claim

(Testimony of Stephen Davidson Bechtel.)

and will continue to claim against you for the entire additional cost and expense and the reasonable value, including a reasonable profit, of the additional work to which we have been and will be put, if we continue with the performance of our contract for construction of the tunnels."

Now at that time, that was the first time you claimed additional compensation, that is correct, is it not? A. I believe it is.

Q. In writing. And at that time, five days after your letter of August 23rd you were claiming additional compensation, but you say when you wrote your letter of August 23rd that you did not have that particularly in mind, that was something for the future?

A. This matter became of increasing concern to us.

Q. During those five days?

A. During the entire period of consideration, both from the time it became apparent that we had to trim [1136] and set back the timbers, and the ensuing period for several months in there it was an increasing concern.

Q. That concern had increased sufficiently so that from August 23 to August 28 it began to take a financial phase; on August 23 it was the basis of a desire of doing the job economically, one that the District would be proud of, and on August 28th you were desiring compensation for the extra work?

(Testimony of Stephen Davidson Bechtel.)

A. In addition to the other points.

Q. In addition to the other points? A. Yes.

Q. Then the next paragraph of the letter:

"At this time we are unable to furnish an exact detailed statement of the amount of our claim. It will include the reasonable value, including all costs and expense to which we may have been heretofore or may be hereafter put, of all additional excavation, timbering, concreting, and labor and materials of any kind or character occasioned thereby, including any and all items attributable thereto of any kind or character."

Now, by that term you refer to all of the material that was taken out, outside of the neat concrete line area, the area in which the timbering was installed, and timbers that you placed in, the concrete that you placed between the timbers; that is all included in what you had in mind as an itemized statement?

A. That should be all considered in determining the final cost or proper compensation, if any.

Q. Even though at the time you went underground in the proposal for this bid Mr. Larson said that he expected to use timber in the first 760 feet of the tunnel and let it remain in? That is true, is it not?

A. I cannot tell you exactly the thought that was in back of this thing, but a reasonable interpretation that I would give at this time is we would be entitled to the reason- [1137] able value of the in-

(Testimony of Stephen Davidson Bechtel.)

creased cost we were put to by conditions which were outside or contrary to the contract which we had made, and that would be our only expectation of getting that actually in the final determination.

Q. "You are further advised and notified that you are in default in performance of your obligations under our contract with you by reason of your failure to furnish necessary lines and grades and any other engineering which you are obligated to furnish under the terms of the contract."

Now, with reference to that, Mr. Bechtel, it is true, is it not, that as early as December 26, 1934, you had requested and demanded additional engineering and that on the 3rd of January, 1935, the District Engineer had told you that the engineering which was furnished by the District would continue just as it had been furnished previous to your written request of the 26th of December, 1934?

A. Yes, but that is not conclusive, it is always proper—it might be that he was wrong, and if so, we would be provided compensation in due time, and we are here reiterating our claim, our contention, for adequate compensation for that reason.

Q. And during all of the time that you were driving the tunnel you continued to furnish the work of engineering that was requisite to the performance of your work just as you had done it prior to the 26th of December?

A. Yes, we continued to do it, with the belief

(Testimony of Stephen Davidson Bechtel.)

that the District was obligated to do it, which we told them they were obligated to do, and which common practice required that they do, and we continued to do that, in order to see that this job went forward.

The Court: We will take a recess now until two o'clock.

(A recess was here taken until two o'clock p. m.)

[1138]

Afternoon Session

Wednesday, April 27, 1938

2 O'clock P. M.

STEPHEN DAVIDSON BECHTEL

Cross Examination (continued)

Mr. Tinning: Q. Mr. Bechtel, it is a fact, is it not, in any of the written requests that were made for an extension of time up to and including your letter of August 28, 1935, you made no reference to any alleged delays in receiving decisions from the District Engineer?

A. I don't recall any, Mr. Tinning.

Q. It is also a fact that, at no time to and including the 13th day of June, 1936, when Six Companies ceased work and prepared a purported notice of rescission, did Six Companies in writing ever make any complaint or statement or objection to the District that it had been delayed in progress

(Testimony of Stephen Davidson Bechtel.)

of the work by reason of the delay in the rendition of decisions by the District Engineer?

A. I believe that Mr. Price——

Q. In writing?

A. No. However, I believe that Mr. Price, in discussing the various matters on the job with Mr. Boggs, told him about the delays,—that the delays in getting decisions was affecting the work.

Mr. Tinning: We ask that the answer go out, your Honor, as not responsive.

The Court: He answered "No", and made the explanation.

Q. Is that correct? A. Yes.

The Court: The answer was "No" as to the written——

Mr. Tinning: But he said he believed someone else——

The Court: What he believes may go out.

Mr. Tinning: Q. Mr. Bechtel, referring now to Paragraph 7 of Plaintiff's Exhibit No. 49, the letter from Six Companies to the District dated August 28, 1935,—which reads as follows: [1139]

> "You are further notified that we have and assert a valid claim for an extension of time for the performance of our contract arising from the causes heretofore stated to you in our request for such extension dated June 10, 1935, and in addition to the extension of time requested therein, we now assert a right to and request such additional extension of time as

(Testimony of Stephen Davidson Bechtel.)

may be necessary to complete the contract, in the event that we continue to perform same, based upon the following reasons in addition to those heretofore asserted—"

Now, that is the first time that you have advanced, on behalf of Six Companies to the District, in writing, a statement that you were entitled to an extension of time due to ground conditions, is it not? A. No; I wouldn't so interpret it.

Q. When did you first, in writing?

A. The June 10th letter was sent to the District in confirmation of the discussions which I had had with Mr. Boggs in Mr. Price's presence, and this is a further elaboration on that. I believe that letter said that we may subsequently give you a more fully detailed statement of the reasons why we are entitled to an extension of time.

Q. That letter of June 10th is Plaintiff's Exhibit No. 45. Is it your testimony that that letter stated you had been delayed by heavy ground conditions?

A. May I see it, please, Mr. Tinning?

Q. I will read you the letter, but I won't read the address:

"Dear Sirs:

"Pursuant to the provisions of subsection C of Section 4 of the Specifications for the construction of the Broadway Low Level Tunnel, said section 4 having to do with the subject of time, we hereby make written application for

(Testimony of Stephen Davidson Bechtel.)

an extension of the time for completion of the work covered by the contract in the amount of one hundred eighty days.

"Said demand is based upon the provisions of said subsection C of section 4, and upon the grounds that the work has been delayed [1140] by Acts of God, stormy and inclement weather, and other reasons beyond our control which will have unavoidably delayed the work.

"The other reasons above mentioned may be made the subject of a detailed statement thereof by us at a later date."

Is there anything in that letter, Mr. Bechtel, that stated, in writing, that you claim to have been delayed in your work by unanticipated heavy ground conditions? Will you answer "Yes" or "No"?

A. I think it is difficult to answer that "Yes" or "No", Mr. Tinning.

The Court: Q. That letter that he has just read, coupled with the letter that you have there—that is the first writing on this subject?

A. Those two, yes.

Mr. Marrin: Mr. Tinning, I think it would be fair, in connection with the next question, to draw his attention to the letter of July 26, 1935.

Mr. Tinning: Yes.

Q. It is true, Mr. Bechtel, that the July 26th letter—in that letter, you referred to the ground conditions being far worse than you anticipated?

(Testimony of Stephen Davidson Bechtel.)

A. I do not carry that letter in my mind; but, if you say it is so, that makes it so.

Q. It is a fact, is it not, and it was called to your attention this morning?

A. Apparently so.

Q. There is nothing else beside the reference in the letter of the 26th of July that antedates the letter of August 28th, 1935?

A. Except the reference to the June 10th letter.

Q. You were asking for action on that letter; and, during the month from June 10, 1935, to July 12, 1935, you submitted no further reasons, in writing? A. I think that is correct.

Q. Subparagraph "B" of paragraph seven of your letter of August 28th reads as follows: [1141]

> "Inadequacy and unsafety of the design in accordance with our letter to you dated August 23, 1935;
>
> "(c) Additional work required to be done not included, intended, or contemplated by the contract, plans and specifications."

The letter of August 23rd and the letter of August 28th were both in 1935, and were the first time that you had referred at any time, in writing, to having to do additional work; that is true, is it not? A. I think that is correct.

Q. It is also true that the same letter was the first time that you ever had claimed there was any inadequacy or unsafety or insafety in the design?

(Testimony of Stephen Davidson Bechtel.)

A. Yes, with the exception of the discussions which our consulting engineers had with Mr. Boggs.

Q. I am talking about writings.

A. I said "Yes."

Q. The discussions with your engineers were some time after the first of August, were they not?

A. I believe that they were.

Q. Isn't it a matter of fact, Mr. Bechtel, that Mr. Tibbitts visited the ground on the 9th of August, 1935? A. I don't know the date.

Q. You have not checked that up?

A. No; I have not checked it up.

Q. We will now proceed to the next paragraph of the letter,—paragraph 8:

> "By reason of the facts asserted in this letter a right to rescind our contract with you has arisen in our favor, but we do not desire to exercise such right unless it is absolutely necessary, as we consider that it is the primary purpose and object of the District to complete the tunnel and the entire project as speedily as possible. If we exercise our right to rescind at this time, it will result in great delay to the project and might result in loss of a portion of the work already done in the construction of the tunnels. We are anxious that the work be completed, and to [1142] complete same for you; and we assume that you are of the same mind."

(Testimony of Stephen Davidson Bechtel.)

Now, when you wrote this letter on August 28, 1935, you knew, according to your letter, that you had a right to rescind?

A. We were so advised by our counsel.

Q. And you had legal advice?

A. That is correct.

Q. And that legal advice, having had that, you wrote this letter? A. That is correct.

Q. And you also had legal advice when you wrote the letter of August 23, 1935?

A. That is right.

Q. Did you also have legal advice when you wrote the letter of July 26, 1935?

A. Yes. I think we had it practically throughout the entire year of 1935,—if that clarifies the point.

Q. Did you have legal advice when you wrote the letter of December 26, 1934, requesting the District to furnish additional engineering?

A. I don't recall; but I presume that we did.

Q. But, notwithstanding the fact that, on the 28th day of August, 1935, you were advised and so stated to the District that you had a right to rescind, you continued to work on these tunnels until the 13th day of July, 1936,—ten months later?

Mr. Marrin: June.

Mr. Tinning: June, yes.

The Witness: A. Yes. My explanation of that —I might comment on that: that this matter was considered by the Board of Directors of the Six Companies of California, and we had advice that

(Testimony of Stephen Davidson Bechtel.)

we were entitled to, or were privileged to, under our contract, stop,—refuse to go on; and to claim damages or costs for the work done to that time. In spite of the fact we were advised we had a right to do that, our board of directors as a whole favored going on,—desired to go on and complete this job; and we were in hopes that we could negotiate the matter out with the District on an equitable, [1143] fair, reasonable, basis; and we continued to hope so until June of the following year.

Q. Under the terms of the contract?

A. Under the terms of the contract.

Q. And during the succeeding ten months, to and including May of 1936, you received payments monthly from the District for the quantities and proportion of the work performed by you?

A. Yes; and in further explanation of that, I might comment: that we continued, on to the time until we finally were driven off the job, to negotiate the matter out with the District Engineer, with you, with the Board of Directors, with the PWA; and we had always hoped that we—that the matter could be amicably and reasonably settled with you, and continued in that hope and that expectation; and I also might comment that we continued to pour money into the hole for month after month, and not small money but hundreds and hundreds of thousands of dollars, to carry the work forward.

(Testimony of Stephen Davidson Bechtel.)

Q. But you were paid in accordance with the terms of the contract, each month from August, 1935 to and including the payment that you received in May of 1936, covering your May estimate, in accordance with the terms of the contract?

A. No. We were paid certain sums of money that were given us with your typed, or your regular monthly estimate, that paid in part for the work that was done; and we had notified you several times, in these various letters, up to date and subsequent letters, that it was not in full compensation; we never considered it was in full compensation; and you knew it was not in full compensation.

Q. Well, Mr. Bechtel, I object to your stating what I knew.

A. I say "You"—"The District"—because we had sent them letters.

Q. You mean you made certain communications; and, to follow that [1144] subject a little further, you were advised a number of times by the District that the District considered you were bound under the contract, and it was your duty to proceed?

A. That is correct.

Q. Now, coming back to the letter and reading paragraph 9:

> "We invite your consideration to the various matters set forth in this letter, but must inform you at this time that if we continue with the work it will be only upon the following conditions:

(Testimony of Stephen D. ridson Bechtel.)

"(a) That provision be made immediately to pay us the reasonable value of the additional work we have been called upon to perform, or which it may be necessary to perform hereafter."

Was there any provision made at any time subsequent to the delivery of this letter on August 28, 1935, by which the District agreed to pay you anything additional?

A. No; but in explanation of that, one has to consider the subsequent matters that took place,—the cave-in,—the unforeseen cave-in that night that this letter was delivered to your Board of Directors; the negotiations which transpired for the next two or three months, at our instigation and also with the cooperation of your Board, and your Mr. Boggs, endeavoring to find a solution to this mutually difficult problem.

Q. Paragraph (b)—this was a condition upon which you would proceed with the work:

"An extension of time be granted immediately which will enable us to complete the work without penalty unless delay hereafter occur which is due to our fault."

Now, no extension of time was granted?

A. No; we were told by Mr. Boggs, subsequently, in November—I was told, as I reviewed here last Friday, that we were entitled to an extension of time,—such an extension of time.

(Testimony of Stephen Davidson Bechtel.)

Q. You never received an extension of time?

A. No.

Q. And you continued with the work?

A. That is correct. [1145]

Q. And there was no discussion of extension of time from the time this letter was written on August 28, 1935, until this complaint which you say occurred in November of 1935?

A. If there were, I am not familiar with them.

Q. So far as you know?

A. I do not. None that I recall.

Q. And work continued?

A. That is correct.

Q. Section (c):

> "Henceforth you perform all the necessary and proper engineering work, including the giving of all lines and grades, and assume responsibility for all engineering work which we have already performed and pay the cost of same."

Was any change made, in the engineering arrangement, after the delivery of this letter of August 28, 1935, up to and until the time that Six Companies ceased the work on the 13th of June, 1936?

A. No; it continued to be not as required or anticipated.

Q. The statement you would not continue to work on the tunnel unless these conditions were

(Testimony of Stephen Davidson Bechtel.)

met was a statement that you made at that time but you did continue the work?

A. Yes, we continued for the reasons I outlined here before; and after very careful consideration of our board of directors and the concurrence of all of them that we would proceed even though our legal counsel had advised us that we did have the right to stop work; we were not obligated, under the contract, to proceed, but that we of the board of directors desired to complete this job if it was possible at all.

Q. We will now proceed to paragraph 10 of the letter:

> "We will proceed with installation of type 'A' tunnel construction in the excavated portion of the two tunnels from the westerly end thereof, subject to the conditions specified in our letter to you dated August 23, 1935. We will do this for the purpose of preventing any loss that might otherwise occur of the excavated [1146] portion of the tunnels in which concrete has not yet been installed, unless notified by you to cease such work. We will not perform any other work in the construction of the tunnels under our contract with you unless notified within a reasonable time after receipt of this letter that the conditions set forth hereinabove are satisfactory and will be met by you."

(Testimony of Stephen Davidson Bechtel.)

At any time subsequent to August 28, 1935, did the District advise you that it would meet the conditions which you sought to impose by that letter?

A. No; it did not.

Q. And you proceeded with the work?

A. We did. [1147]

Q. In order to complete the chronology, Mr. Bechtel, is it true that this letter was delivered to the Board of Directors of the District on August 28th, some time in the afternoon, I think the time was 3:50 in the afternoon, at which time there was a meeting between the Board of Directors of the District, in which a number of representatives of the Six Companies were present, including yourself, and I think Mr. Kaiser, and I think some of your present counsel, in which the matters referred to in the letter were discussed, and you were advised that the question of the adequacy of the design, etc., had been referred to an engineering board and that at a later date you would be advised what the position with respect to those matters was?

A. My recollection is it was referred to counsel for consideration.

Q. Referred to——

A. (Interrupting): You did most of the talking at that meeting, you will remember, Mr. Tinning.

Q. I do not recall; I think I heard you do considerable.

A. Mr. Kaiser did most of the talking that day.

Q. And then on the night of August 28th, I think

(Testimony of Stephen Davidson Bechtel.)

it was, some time around 7 or 8 in the evening that night, within a very few hours after this discussion of the adequacy of the design, and the engineering, and the different contentions that are set up in the letter had been discussed, there was a very serious cave-in of the north tunnel, in which three men were killed. A. Yes.

Q. That cave-in was not in a concreted portion of the tunnel, was it?

A. It was not. However, the footings had been concreted to that point.

Q. The footings were a concrete 5-foot wide strip upon which the arch was later poured; is that correct?

A. Upon which the side walls were first poured, over which the arch was subsequently poured. [1148]

Q. And supporting the arch they formed, you might call it, the bottom of the inverted horseshoe that formed the lining? A. Yes.

Q. And that burst of earth that came into that tunnel came from the timber which had been installed in the tunnel some time before and which were being re-set at that time by the crew that was working there to get the timbers back so that they would be safe in constructing the concrete lining as required by your specifications?

A. I cannot testify to that, Mr. Tinning; I had not been in that tunnel for several days prior to that cave-in, and anything that I might say would be a matter of observation thereafter, or from hearsay. I am not familiar with it.

(Testimony of Stephen Davidson Bechtel.)

Q. You do know that this cave-in was not in the permanent lining?

A. I observed that since that time.

Q. It was not in the lining which was referred to in your letter of August 23, 1935, and again referred to as inadequate and unsafe lining in your letter of August 28th?

A. It was preparatory to the liner which is involved there.

Q. Would you mind answering the question "Yes" or "No" and then if there is an explanation make it. The question was whether the slide occurred in a portion of the tunnel where the concrete lining, permanent lining had been installed.

A. A portion of the lining had been installed.

Q. Where the slide occurred?

A. The footing.

Q. The footing? A. Yes.

Q. Which were how deep?

A. I would say approximately five feet, four feet or five feet.

Q. High? A. Yes, on the side.

Q. And the timbers that failed were in the roof?

A. That is what I understand, but, again, that is from hearsay.

Q. So that there was no complete concrete lining at the place where [1149] the slide occurred?

A. That is correct.

Q. And the slide or cave-in occurred in temporary timbers which were installed by you precedent to placing the permanent lining?

(Testimony of Stephen Davidson Bechtel.)

A. It occurred in the timbers that were placed before the concrete lining was placed.

Q. The Six Companies put them in?

A. Yes, that is right, as I understand it.

Q. And it did not occur in the lining which you said in your two letters was inadequate and unsafe?

A. No, but in explanation of that I might comment that our letter of August 23rd was written in fear that such a situation might develop. We had been substantially scared by the advice we had gotten from our consulting engineers, they were afraid that something of that kind might happen if those timbers were set back, were moved, or were trimmed substantially, and it was growing out of that, their warning, that that letter was written, and this cave-in followed in due time, as you have outlined.

Q. Now, when you wrote that letter of August 23rd you knew that the dangerous condition was in the timbers due to the necessity of setting them back under the District's requirements—you knew that when you wrote the letter, your expert had told you that?

A. It was a type of timbering that was necessary to get the type of lining which we had been required to place.

Q. Now, you say that the footings had been poured. The Six Companies at this time, just a few days before the letter of August 28th, had started very active footwall operations, had they not?

A. Yes.

(Testimony of Stephen Davidson Bechtel.)

Q. And at the time that the accident occurred at the bottom of each, on opposite sides of the tunnel, a trench had been excavated which was lower than the bottom of the posts into which you planned to pour concrete fittings?

A. Probably it would be more properly [1150] described as the excavation necessary to place the concrete footings.

Q. Do you know as a matter of fact that that extended below the bottom of the posts so that the bottom of the trench was lower than the bottom of the posts that supported the arch to the earth?

A. I do not quite follow you.

Q. Don't you know as a matter of fact that those trenches that were prepared in which the concrete was to be poured were excavated, dug out, so that the bottom of those trenches was below the plumb posts that formed the side of the tunnel timber arch, the ring? A. I observed that subsequently.

Q. You did not know it at that time?

A. I had not been in that tunnel for several days, in that tunnel.

Q. And when those trenches were so excavated the bottoms of the plumb posts, the bottom posts, the vertical or nearly vertical posts were standing on a shelf of earth higher than the bottom of the trench which was excavated, so that the bottoms of those plumb posts were unsupported by any material except that which was directly below them?

A. I would not just put it that way. I might

(Testimony of Stephen Davidson Bechtel.)

observe that there was no excavated and unconcreted footing in the area of the slide. I observed that myself. Also I might observe that there was no difficulty experienced at any place where these footings had been excavated and unconcreted, and also that immediately following this slide these footings that had been excavated were concreted forthwith; that we started an aggressive program to get our footings ahead and anticipated lining at a very rapid pace, which is practical under the method which we have outlined and which we had anticipated following.

Mr. Tinning: If your Honor please, I offer in evidence a letter dated August 30, 1935, written by Wallace B. Boggs, Dis- [1151] trict Engineer, to Six Companies of California, as Defendant's Exhibit MM. It reads as follows:

DEFENDANT'S EXHIBIT MM

August 30, 1935

File: Broadway Tunnel
Six Companies of California,
Field Office,
Post Office Box 120,
Berkeley, California.

Attention of Mr. T. M. Price, Project Manager

Dear Sir:

You are here hereby advised that a very critical situation exists with respect to the stability

(Testimony of Stephen Davidson Bechtel.)

of the timbered section of the tunnels as a result of the large amount of footing trench now open.

There is now between 900 and 1,000 feet of this trench open, with varying depths below the timber footings. Much of this trench is filled with water, increasing the instability of the timber supports. It is extremely probable that the continuance of this condition will cause failure of timber supports, and it is possible that future failure may already have been induced.

You are advised that Joint Highway District No. 13 of the State of California will hold you strictly responsible for any damage of any sort whatsoever that may result from this condition or from any other inadequacy of the timbering to support the excavation.

Yours, truly,

(Signed) WALLACE B. BOGGS,
District Engineer.

WBB/VE

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. MM. Filed April 27, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

(The letter was marked "Defendant's Exhibit MM.")

If your Honor please, I offer in evidence a letter from Six Companies of California addressed to Mr. Wallace B. Boggs, District Engineer, on August 31,

(Testimony of Stephen Davidson Bechtel.)

1935, as Defendant's Exhibit NN. I will read it. (Reading): [1152]

DEFENDANT'S EXHIBIT NN

Builders of Low Level Broadway Tunnel
Six Companies of California

Field Office Post Office Box 120
Berkeley, California

August 31, 1935

Mr. Wallace B. Boggs, District Engineer,
Joint Highway District No. 13,
1448 Webster Street,
Oakland, California.

Dear Sir:

We herewith acknowledge receipt of your favor of August 30th, relative to footing trench in the tunnels.

We checked this fully excavated footage late on August 31st, which measurements showed 339 ft. in the down-grade tunnel, and 306 ft. in the upgrade tunnel. At other places, where partial excavation had been made, none had gone far enough to expose the ground below the footings of the timber.

We poured approximately 200 lineal ft. of the above stated footage on August 30th in the upgrade tunnel, and on this date have completed pouring of the remainder of the open trench in this tunnel, namely, 106 ft.

It has obviously been impossible for us to pour the trench in the downgrade tunnel since

(Testimony of Stephen Davidson Bechtel.)

the cavein. However we are now planning to pour this open trench by pumping the concrete through the construction adit, and using buggies to transport it in the tunnel, just as soon as we consider it safe for men to work in the down-grade tunnel.

Our position with regard to our responsibility has been fully stated to you in our letters of August 23rd and 28th respectively.

Very truly yours,
SIX COMPANIES OF CALIFORNIA,
By (signed) T. M. PRICE
Project Manager

[Endorsed]: Received Sept. 4, 1935, 8:30 a. m. Joint Highway Dist. No. 13.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. NN. Filed April 27, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

(The letter was marked "Defendant's Exhibit NN.")

Q. The downgrade tunnel is where the cavein occurred?

A. The north tunnel.

Q. The north tunnel? A. Yes.

Q. Mr. Bechtel, so that the record may be clear, the adit is a cross-over drift from one tunnel to another and fortunately when this accident occurred there was such a drift beyond the point where the

(Testimony of Stephen Davidson Bechtel.)

slide occurred that opened the north tunnel into the south tunnel, through which the men were able to get out into the south tunnel? [1153]

A. Yes.

Mr. Marrin: I might say that letter is not signed by the witness, but by T. M. Price.

Mr. Tinning: I beg your pardon

Mr. Marrin: You did not read the signature.

Mr. Tinning: I will try to remember to do that.

The defendant offers in evidence a letter dated September 1, 1935, addressed by Six Companies of California to Mr. Wallace B. Boggs, District Engineer, and ask that it be marked Defendant's Exhibit OO. It is signed by Mr. Price. It reads:

DEFENDANT'S EXHIBIT OO

Builders of Low Level Broadway Tunnel
Six Companies of California
Field Office Post Office Box 120
Berkeley, California
September 1, 1935

Mr. Wallace B. Boggs,
District Engineer,
Joint Highway District No. 13,
1448 Webster St., Oakland, Calif.

Dear Sir:

In the interest of safety, and in order to reduce the hazards connected with the work of trimming and moving tunnel timber supports

(Testimony of Stephen Davidson Bechtel.)

made necessary under the requirements of the plans and specifications for the Broadway Tunnels, to provide space for the minimum thickness of the concrete lining specified, it is suggested and we request that you direct us:

1. To complete the concreting of the unlined portions of the excavated tunnels with a crown height 6" lower than the crest of the present theoretical crown height.

   If this permission is granted, we will cut out six inches at each side of our present steel tunnel forms at the vertical tangent sections about ten feet above the base of the concrete lining.

   A neat transition as designed by your office will be used to joint to the present design section if this permission is granted.

   This change will result in the addition of approximately 1,000 cubic yards of concrete in the open section of about 1,800 feet of unlined tunnel that will be affected.

2. To allow tunnel timbering, including posts, segments and wall plates, to project a maximum of 4" into the theoretical minimum thickness of concrete lining called for in the plans; provided:

(Testimony of Stephen Davidson Bechtel.)

a. In each six-foot length of tunnel, openings of twelve inches or more in width, between sets, are made available for concrete, and are as great in area as those lost by the intrusion of the timbers;

b. The concrete rings between the sets are continuous and not less than twelve inches in width uninterrupted by wall plates or other obstructions or by the arch segments not being in line with the posts;

c. That whenever the thickness of concrete in front of the sets is reduced, then reinforcing steel sufficient to cause the ring concrete to react in conjunction with the arch concrete shall be furnished and placed by the contractor.

Very truly yours,
SIX COMPANIES OF CALIFORNIA
By (signed) T. M. PRICE
Project Manager

[Endorsed]: Received Sept. 2, 1935. Joint Highway District No. 13.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. OO. Filed April 27, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk. [1154]

(The letter was marked "Defendant's Exhibit OO.")

(Testimony of Stephen Davidson Bechtel.)

If your Honor please, the defendant now offers in evidence a letter from Six Companies of California, signed by T. M. Price, Project Manager, dated September 3, 1935, addressed to Mr. Wallace B. Boggs, District Engineer of the District, and ask that it be marked "Defendant's Exhibit PP." It reads: [1155]

DEFENDANT'S EXHIBIT PP

Builders of Low Level Broadway Tunnel
Six Companies of California
Field Office Post Office Box 120
Berkeley, California
September 3, 1935

Mr. W. B. Boggs, District Engineer,
Joint Highway District No. 13,
1448 Webster Street,
Oakland, California.

Dear Sir:

Under date of September 1st, we wrote you a letter concerning changes in plans and specifications for concrete lining of the excavated portion of the Broadway Tunnels.

By this letter we advise you that our letter of September 1st, above mentioned, was written and shall be considered by you subject only to the following further conditions:

1. That in making the suggestions contained therein, we assume no responsibility

(Testimony of Stephen Davidson Bechtel.)

or liability of any kind or character for any design suggested by us or the safety thereof, in the event you direct us to carry out the things stated in our letter.

2. That we reaffirm and state our position to be as stated in our letters to the Board of Directors of your District dated respectively August 23rd and August 28th, 1935.

3. That any rights that we may have, heretofore or now existing, in our relationship with you under our contract with you will not in any manner be prejudiced or altered in the event that you direct us to proceed, as suggested in our letter of September 1st.

4. It has been called to our attention that a large amount of additional reinforcing steel is now being placed in the concrete which is now being installed in the tunnels and also that more cement is being required to be placed in the concrete than is called for or required under the plans and specifications. You are hereby advised that the placing of such steel, the furnishing of more cement, and all other items of work, labor, or materials performed or furnished in connection with the prosecution of the tunnel work are being furnished solely upon the basis that the contract, plans and specifications are being varied

(Testimony of Stephen Davidson Bechtel.)

from, and we are entitled to additional compensation by reason of these particular facts as well as by reason of the matters and things stated in our letters of August 23rd and August 28th above mentioned.

Yours very truly,

SIX COMPANIES OF CALIFORNIA

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. PP. Filed April 27, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

(The letter was marked "Defendant's Exhibit PP.")

The defendant now offers in evidence, if your Honor please, a letter addressed to Six Companies of California by the Joint Highway District, dated September 5, 1935, and ask that it be marked Defendant's Exhibit QQ. It reads as follows:

DEFENDANT'S EXHIBIT QQ

September 5, 1935

Six Companies of California
155 Sansome Street
San Francisco, California

Gentlemen:

The Board of Directors of Joint Highway District No. 13 has considered your letters of

(Testimony of Stephen Davidson Bechtel.)

August 23rd and August 28th, September 2nd and September 3rd, 1935. I am instructed to advise you that the Board of Directors have concluded that the design of the tunnel lining provided for in the plans and specifications is adequate in every respect for all of the conditions encountered and the materials at the site of the Broadway Low Level Tunnel, and that no variation, deviation or change will be made in the same, and that you will be held strictly to the performance of your contract of June 4, 1934 in accordance with the terms thereof, and the plans and specifications for the work included in your contract.

Further, the District denies all liability for any of your claims for extra work, labor, materials, cement or steel furnished or supplied by you in your work of construction under said contract.

Yours very truly,

(signed) HARRY M. STOW

Secretary

HMS:K

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. QQ. Filed April 27, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk

(The letter was marked "Defendant's Exhibit QQ.")

(Testimony of Stephen Davidson Bechtel.)

Your Honor please, the defendant offers in evidence a letter dated September 5, 1935, signed by Wallace B. Boggs, District Engineer, and addressed to Six Companies of California, and I ask that it be marked "Defendant's Exhibit RR." It reads:

DEFENDANT'S EXHIBIT RR

September 5, 1935

Six Companies of California
Field Office
Berkeley, California
Attention of Mr. T. M. Price, Project Manager.

Dear Sir:

I am advised by you and Mr. O. W. Peterson, your engineer, that Six Companies of California, the contractor on the Broadway Tunnel Project, is planning to proceed with the pouring of concrete in tunnel bores using forms which will result in a permanent reinforced concrete tunnel lining which does not conform to the plans and specifications for the work.

You are hereby ordered to cease and desist in any such procedure as the same is entirely without authorization by this District and is a direct violation of your contract with the District. You are further advised that such work must not be performed and all steps on your part to perform such work as you have indicated you intend to perform, should immedi-

(Testimony of Stephen Davidson Bechtel.)

ately cease if the work is now in progress, and that any concrete tunnel lining placed in accordance with your proposal will be rejected by the District and will be ordered removed.

Yours very truly,

(signed) WALLACE B. BOGGS
District Engineer

WBB:K

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. RR. Filed April 27, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

(The letter was marked "Defendant's Exhibit RR.")

If your Honor please, the defendant now offers in evidence a letter dated September 14, 1935, from Six Companies of California, [1158] addressed to Wallace B. Boggs, District Engineer, signed by T. M. Price, Project Manager, and I ask that it be marked "Defendant's Exhibit SS." It reads (reading):

(Testimony of Stephen Davidson Bechtel.)

DEFENDANT'S EXHIBIT SS

Builders of Low Level Broadway Tunnel
Six Companies of California
155 Sansome Street
San Francisco, California

September 14, 1935

Mr. Wallace B. Boggs, District Engineer,
Joint Highway District No. 13,
1448 Webster Street,
Oakland, California.

Dear Sir:

We desire to acknowledge receipt of your letter of the 5th instant.

Six Companies of California suggested the alternative plan outlined in our letter dated September 1st for concreting the tunnels for the purpose of making the construction operations safer and minimizing the damages which would result from exactly following the plans and specifications.

However, in view of the instructions contained in your letter, we shall proceed immediately to concrete the tunnels in strict compliance with the plans and specifications.

By doing so we do not waive any of our rights or any claims which we now have, or may hereafter have, against the District and you are notified that we shall claim and hold the Dis-

(Testimony of Stephen Davidson Bechtel.)

trict responsible for all damages resulting from this procedure.

Very truly yours,
SIX COMPANIES OF CALIFORNIA
By (signed) T. M. PRICE
Project Manager

[Endorsed]: Received September 14, 1935, 3:35 P. M.
Joint Highway Dist. No. 13.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. SS. Filed April 27, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

(The letter was marked "Defendant's Exhibit SS.")

Your Honor, there are four letters here that have to do with the request from the contractor for authority from the District to permit the timbers to remain in at certain places, and there are a lot of figures, and I think counsel is agreeable to my introducing the letters and not reading the station numbers.

I now offer in evidence a letter dated September 14, 1935, [1159] from Six Companies of California, signed by Mr. Price, to Wallace B. Boggs, District Engineer, and ask that it be marked "Defendant's Exhibit TT. It reads:

(Testimony of Stephen Davidson Bechtel.)

DEFENDANT'S EXHIBIT TT

Builders of Low Level Broadway Tunnel
Six Companies of California
Field Office Post Office Box 120
Berkeley, California

September 14, 1935.

Mr. Wallace B. Boggs,
District Engineer,
Joint Highway District No. 13,
1448 Webster Street,
Oakland, California.

Dear Sir:

In accordance with the provisions of subparagraphs B and E, of numbered paragraph 5 of section 32 of the specifications for the construction of the Broadway Tunnel, your written permission is requested for the timbers to remain in the sections of the two tunnels hereinafter described.

The portions of the tunnels for which this permission is requested are described as:

	Down Grade	Up Grade
Arch Concrete	111+43 to 113+31	111+53 to 114+02
Footing Concrete		
Left	113+31 to 114+37	114+02 to 116+91
	114+92 " 116+00	118+59 " 121+59
	116+51 " 117+50	
	118+24 " 117+71	
Right	113+31 to 115+99	114+02 " 116+98
	118+34 " 118+66	118+16 " 118+42
		119+00 " 121+46

(Testimony of Stephen Davidson Bechtel.)

Concrete has already been placed in the sections above described; and, in addition, similar permission is requested for timbers to remain between stations 114+02 and 114+20, where concrete will be poured within the next twenty-four hours.

Very truly yours,
SIX COMPANIES OF CALIFORNIA
By (Signed) T. M. PRICE,
P:C Project Manager.

[Endorsed]: Received Sept. 16, 1935. Joint Highway Dist. No. 13.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. TT. Filed April 27, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

(The letter was marked "Defendant's Exhibit TT.")

The defendant now offers in evidence, if your Honor please, a letter dated September 16, 1935, addressed by Mr. Wallace B. Boggs, District Engineer of the District, to the Six Companies of Califor-
[1160] nia, and ask that it be marked in evidence as Defendant's Exhibit UU. It reads:

(Testimony of Stephen Davidson Bechtel.)

DEFENDANT'S EXHIBIT UU

September 16, 1935

File: Broadway Tunnel
Lining
Six Companies of California,
Field Office—P. O. Box 120,
Berkeley, California.

Attention of Mr. T. M. Price, Project Manager

Dear Sir:

Receipt of your letter of September 14, 1935, is acknowledged.

The alternate plan suggested by you would constitute a change in the plans and specifications to meet conditions created solely by your method of operation in delaying the placing of the permanent reinforced concrete lining, during which period the temporary timber support has generally intruded into the area required for the permanent tunnel lining specified.

No rights or claims have arisen or can arise in your favor by reason of your performance of your contract with the District in accordance with the plans and specifications, save the right to payment for the work performed, and the District has made and will make all payment in accordance with the terms of the contract.

Yours truly,

(Signed) WALLACE B. BOGGS,
District Engineer.

(The letter was marked "Defendant's Exhibit UU.")

Defendant now offers in evidence a letter dated September 16, 1935, addressed to Six Companies of California by the District, and ask that it be marked in evidence as Defendant's Exhibit VV. The letter reads as follows: [1161]

DEFENDANT'S EXHIBIT VV

September 16, 1935

File: Broadway Tunnel
Timbering
Six Companies of California,
Field Office
Post Office Box 120,
Berkeley, California.

Attention of Mr. T. M. Price, Project Manager

Dear Sir:

In reply to your communication of September 14, 1935, you are advised as follows:

In accordance with the provisions of subsections (b) and (e) of numbered subsection 5, Section 32 of the specifications, consent is hereby given to permit timbering to remain in the sections of the tunnels described in your

(Testimony of Stephen Davidson Bechtel.)

communication, subject, however, to the provisions contained in the specifications with respect to clearances outside of the concrete lining, and other requirements of the specifications.

In addition, this consent is extended to all portions of the excavation now open in each tunnel between the West Portal and the easterly ends of the full section excavation in the vicinity of Sta. 122 in the Downgrade Tunnel and the vicinity of Sta. 124+50 in the Upgrade Tunnel, subject to provisions contained in the specifications with respect to clearances outside of the concrete lining, and other requirements of the specifications.

Yours very truly,

(Signed) WALLACE B. BOGGS,

District Engineer.

Mr. Max Thelen
Attorney at Law
Balfour Building
San Francisco, California

Dear Mr. Thelen:

This letter will confirm our conversation of Saturday morning, September 14th, in which I advised you that the District would be willing to consider a request from Six Companies of California, the contractor, for permission to install the permanent reinforced concrete lining in the sections of the Broadway Tunnel bores now open, provided the State of California, the United States Bureau of Public Roads and the Public Works Administration agreed to such modification, upon the condition that the contractor waived all of the claims, contentions and demands set forth in its letters of July 26th, August 23rd, August 28th and September 3rd, 1935, addressed to the District, and

(Testimony of Stephen Davidson Bechtel.)

that if the contractor did not care to withdraw the claims, demands and contentions referred to that the District's position was that the contractor should proceed to construct the tunnel in accordance with the plans and specifications without further delay.

This letter is sent you as a matter of record of our conversation.

Yours very truly,

(Signed) ARCHIBALD B. TINNING
Attorney

DEFENDANT'S EXHIBIT CCC

September 19, 1935

File: Broadway Tunnel
E. P. Schedule--Lining
Six Companies of California,
Field Office,
Post Office Box 120,
Berkeley, California

Attention of Mr. T. M. Price, Project Manager

Dear Sir:

Information is requested as to your proposed schedule and methods of procedure in connection with the tunnel operations at the East Portal.

The District Engineer considers that a very serious hazard to the lives of workmen and to the structures exists at the East Portal from the probability of slides at the faces and sides of the main excavation, especially if early rains occur.

(Testimony of Stephen Davidson Bechtel.)

Permanent concrete tunnel lining should be placed at once a sufficient distance to provide support against ground movement and backfilling around Portal Building walls should be performed as rapidly as building construction operations will permit.

You are advised that adequate measures should be taken by you at once to protect the structures in this vicinity and the men working on these structures from the dangers of slides.

Yours very truly,
(signed) WALLACE B. BOGGS
District Engineer

SPECIAL SAFETY ORDER REQUIRING REMEDYING OF UNSAFE CONDITION OF PLACE OF EMPLOYMENT

September 19, 1935

To: Mr. Wallace B. Boggs,
District Engineer,
Joint Highway District No. 13,
1448 Webster Street,
Oakland, California.

Whereas, it appears from the report of inspection, dated September 19, 1935, of operations, located at Broadway Tunnel, Oakland, a place of employment, made by L. K. Reinhardt, that a dangerous condition exists in said place of employment, to-wit, Maintenance of equipment, in violation of the safety orders issued by the Industrial Accident Commission, of the State of California, and that Joint Highway

(Testimony of Stephen Davidson Bechtel.)

District No. 13, is the owner or person having the custody, management, or operation of said equipment; and

Whereas, this Commission did on the ..... day of ..... 19....., serve notice on said ..... with a copy of said inspection report attached, directing him or them to show cause, if any he or they had, in writing to this Commission on or before ....., 19....., why said recommendations of said engineer or inspector as set out in said report should not be complied with, and said ..... was further notified therein that, unless good cause be shown to the contrary to this Commission by said ..... before said date, the requirements or recommendations of said engineer or inspector would be adopted as the safety requirements of the Industrial Accident Commission, relative to said place of employment with particular reference to the use of said equipment, and the use of said equipment would be prohibited, and

Whereas, said ..... has made no return or insufficient return to said notice and has not submitted sufficient reason or shown good cause why action should not be taken to prohibit the use and operation of said equipment until such requirements be complied with;

Now, therefore, the following special safety order is hereby made as the order of the In-

(Testimony of Stephen Davidson Bechtel.)

dustrial Accident Commission relative to said equipment confirming said inspection report and the requirements and recommendations therein contained.

It is hereby found and determined that the place of employment of said Joint Highway District No. 13, consisting of a tunnel, located at Oakland, California, is unsafe and dangerous to workmen employed therein and the following precautions must be taken to render the equipment reasonably safe for the use of employees;

1. All timbering in both the north and south tunnels shall not be removed and reset before concreting.

2. The concrete forms may be lowered sufficiently to clear encroachments in the tunnel section, or some other plan, whereby the timbering will not be disturbed, may be submitted to the Commission for approval.

It is further ordered that the use and operation of said equipment be and it is hereby prohibited until said conditions shall be rectified, as aforesaid;

And the Legal Department and/or any employee of the Commission are hereby authorized to attach notice of said prohibition to said equipment and to institute any civil or criminal

(Testimony of Stephen Davidson Bechtel.)

proceedings in the Courts which may be necessary to adequately enforce this order.

[Seal] T. A. REARDON
(Commissioner)
FRANK J. BURKE
Industrial Accident Commission
(Deputy Commissioner)

Dated at San Francisco, California, this 19th day of September, 1935.

[Endorsed]: Received Sept. 20, 1935. Joint Highway Dist. No. 13.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. EEE. Filed April 27, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

Mr. Tinning: Gentlemen, I assume it may be stipulated that a like order was received by the Contractor?

Mr. Marrin: Yes. I was just going to ask you to stipulate the same thing, Mr. Tinning,—an order identical with this was received by the Six Companies of California about the 19th or 20th day of September; I am not sure of the date—with the exception it was addressed to Six Companies of California rather than the District.

Mr. Tinning: Yes.

Mr. Smith: Also, isn't the original of the order on a printed form? Was some of this language

(Testimony of Stephen Davidson Bechtel.)

in printed form and not specially directed—it is correct it is on a printed form, isn't it?

Mr. Tinning: Yes; and I have read a copy in full, in view of the admonitions that I have had from counsel previously.

Mr. Smith: Yes. There were so many blanks, it did not sound intelligible.

Mr. Tinning: And it is a fact that, prior to the issuance of that order, there was no hearing held by the Industrial Accident Commission; these blanks were not filled in for that reason.

Mr. Marrin: No hearing was held.

Mr. Tinning: I think it can also be stipulated that both the Contractor and the District ceased and desisted, and complied with the order at that time; that you did nothing further at that time in the way of work.

The defendant offers in evidence a letter dated September 25, 1935, addressed by the District Engineer, Wallace B. Boggs, to Six Companies of California; and ask it be marked defendant's exhibit in [1172] proper order.

(The letter was marked "Defendant's Exhibit FFF.")

Attention Mr. Max Thelen

Dear Mr. Thelen:

This letter is written in accordance with my telephone conversation with you this afternoon, in which you requested me to put my inquiry in writing in order that you might discuss it with your clients, Six Companies of California, which contracted to construct the project of this District under the contract dated June 4, 1934.

Will the contractor and its bondsmen agree, if permission is granted by the District to install the permanent reinforced concrete tunnel lining in the portions of the tunnel bores which have been excavated but are not now lined with the permanent tunnel lining called for in the plans and specifications, to a section with an intrados crown position ten inches lower than the present designed crown position provided for in the plans and specifications, and with the position of the interior walls of the sides of the tunnel lining a maximum of six inches inside of the present designed position, and to all of the dimensions shown on the preliminary plat presented by the District Engineer to the

(Testimony of Stephen Davidson Bechtel.)

Industrial Accident Commission at its hearing on September 24, 1935, and to install proper transitions from the special sections of the permanent lining to the sections of the permanent lining built in accordance with the original design, and to make such alteration in the location of the ceilings, flues, hangers and other details of the completed structure as are determined necessary by the District Engineer to adjust the same to the special section, all without extra charge to the District, and at the price per lineal foot for completed tunnel provided in the contract of June 4, 1934, the District to pay for all reinforcing steel placed in the lining at the unit price provided for in the contract.

Your reply will be communicated to the Government Engineer, a request having been received by the District from the Government Engineer for this information for use in determining whether or not the Government Engineer will authorize the installation of the special section of permanent lining in accordance with the recommendation made by the District Engineer at the meeting of the Industrial Accident Commission on September 24, 1935.

Yours very truly,

Oakland, California.

(Testimony of Stephen Davidson Bechtel.)

Dear Mr. Boggs:

Receipt of your letter of September 30th, requesting permission to install a special section in the portions of the Broadway Low Level Tunnels which have been excavated but are not now lined with permanent tunnel lining, with the crown position ten inches lower than provided for in the Plans and Specifications, and with the interior walls of the sides of the tunnel linings a maximum of six inches inside of the present designed position, and to all of the dimensions shown on the blue print accompanying said letter designated, "Joint Highway District No. 13, State of California, Alameda Co.-Contra Costa Co. Main Tunnel Special Section Type A", dated September 28th, 1935, is acknowledged.

After considering the same, you are hereby authorized to install the permanent reinforced concrete tunnel lining to the dimensions and in accordance with the design set forth on the blue print entitled, "Joint Highway District No. 13, State of California, Alameda Co.-Contra Costa Co. Main Tunnel Special Section Type A", dated September 28th, 1935. The installation of such lining is authorized only for those portions of the tunnel bores which have been excavated and are now open and supported by temporary timber supports, and all portions of the tunnel bores which have not been excavated

(Testimony of Stephen Davidson Bechtel.)

are to be lined with permanent tunnel lining to the dimensions provided for in the Plans and Specifications.

In re: Broadway Tunnels

Dear Mr. Tinning:

Referring to your letter of the 27th, ult. in the above entitled matter, please be advised that Six Companies of California will, without extra charge to the District by reason of the doing of the same, perform the acts listed in that portion of the second paragraph of your letter which precedes the words "all without extra charge to the District" and will act in accordance with the preliminary plat referred to by you or such modification thereof as may, from time to time, be agreed upon.

This commitment by the Company is not to be extended further than a commitment to perform these particular items without extra charge to the District.

(Testimony of Stephen Davidson Bechtel.)

The matter of the bondsmen we believe to be covered by Paragraph 14 of the Contract of June 4, 1934, between the District and Six Companies of California.

Very truly yours,
THELEN & MARRIN

Mr. W. B. Boggs
District Engineer,
Joint Highway Dist. No. 13
1448 Webster Street
Oakland, California

Dear Mr. Boggs:

I have your letters of October 12 and 14, asking my approval of the use of a revised section of concrete lining as shown on drawing 187/S dated September 28, 1935; this section to be used in all portions of the tunnels which were excavated and not lined on September 30, 1935.

Since this change is necessitated by reason of the safety order issued by the State Industrial Accident Commission and since the con-

(Testimony of Stephen Davidson Bechtel.)

tractor and his sureties have agreed to the change "without additional cost to the District for additional labor and material required—" I am hereby giving my approval.

It is understood that in the portions of the tunnels yet to be excavated the original lining section of the contract will be adhered to.

Very truly yours,

(signed) C. H. SWEETSER
District Engineer

[Endorsed]: Received Oct. 22, 1935. Joint Highway Dist. No. 13.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. LLL. Filed April 27, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

Mr. Tinning: To save putting a lot of extra matter in the record, I presume we can stipulate as to the Safety Order issued by the Industrial Accident Commission which authorized the drop section method to be worked out, and the date of the order was on or about the 24th of September—the hearing was held on the 24th of September, 1935.

Mr. Marrin: I think those orders of the Commission should all go in evidence. It is our intention to offer them if you do not want to offer them.

Mr. Wittschen: If you have them, you can put them in now or afterwards.

Mr. Marrin: We have them, and intend to put

(Testimony of Stephen Davidson Bechtel.)

them in, through Mr. Price, as we did a number of these other matters.

Mr. Tinning: I think we have them here. I may have overlooked it, but it occurred to me as we went along that possibly we might stipulate to it.

We will offer in evidence a letter from Wallace B. Boggs, addressed to Six Companies of California, dated November 8, 1935; and ask it be marked Defendant's Exhibit MMM.

(The letter was marked "Defendant's Exhibit MMM.")

[Endorsed]: Received Nov. 21, 1935. Joint Highway Dist. No. 13.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. No. NNN. Filed April 27, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

Mr. Tinning: Q. It is a fact, is it not, Mr. Bechtel, that Mr. Hindmarsh became the General Superintendent of the tunnel work on or about the date of this letter?

A. No; he had become General Superintendent approximately at September 5, 1935.

Q. Some time in 1934, you notified the District that Mr. Price was Project Manager, and to communicate with him; and then, as a matter of fact, on or about the 5th of September, after the slide, Mr. Hindmarsh took charge and you gave us this notice about the 20th of November? A. Yes.

Q. Mr. Price was no longer in charge of the tunnel after September 5th?

A. Mr. Price continued as Project Manager.

Q. And Mr. Hindmarsh?

(Testimony of Stephen Davidson Bechtel.)

A. He took the responsibility pertaining to tunnel construction.

Q. Did he report to Mr. Price?

A. He collaborated with Mr. Price; worked with him.

Mr. Tinning: The defendant offers in evidence a letter from Six Companies of California, signed by Mr. V. G. Hindmarsh, addressed to Wallace Boggs, District Engineer, as Defendant's Exhibit "OOO."

(The letter was marked "Defendant's Exhibit OOO.")

Mr. Wallace B. Boggs,
District Engineer,
Joint Highway District No. 13,
1448 Webster Street,
Oakland.

Dear Sir:

Since we have resumed excavating in the south tunnel, we have not been furnished lines and grades to work to by your engineering staff, and have been compelled to do this ourselves.

(Testimony of Stephen Davidson Bechtel.)

It is our understanding of the specifications, that you are obligated to furnish lines and grades to us, and we do not feel that we should be put in the position of doing this work, and assuming the responsibility involved in same. We have been doing it thus far, in order not to interfere with progress of the work, but we respectfully urge that you immediately arrange to give us the necessary lines and grades.

We shall be compelled to hold you responsible for the cost of our doing this work, and also for any results of same in the event that damage or loss occurs as a result of doing it, for the reason that it is your responsibility under the Specifications.

Very truly yours,
SIX COMPANIES OF CALIFORNIA,

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. No. OOO. Filed April 27, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

Mr. Tinning: Q. Mr. Bechtel, it is a fact that, after that letter was written, the District refused to furnish anything other than the engineering that had been furnished before that?

(Testimony of Stephen Davidson Bechtel.)

A. It did not, at that time, furnish us the lines and the grades.

Q. Anything additional to what had been furnished before? A. No.

Q. And that matter remained in the same status that it was,—a reiteration of your former request and the position of the District remained the same?

A. It continued a point of controversy.

Mr. Tinning: The defendant offers in evidence a letter dated December 28, 1935, addressed by Wallace B. Boggs, District Engineer, to Six Companies of California; and ask that it be marked as [1183] Defendant's Exhibit PPP. It reads:

CC to Mr. Archibald B. Tinning, Attorney

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. No. PPP. Filed April 27, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

(The letter was marked "Defendant's Exhibit PPP.")

In the chronology of these documents there have been certain documents already introduced that follow along. Plaintiff's Exhibit No. 50, a letter dated February 25, 1936, addressed to Mr. Caldecott, by Six Companies of California, relates to arbitration, and was introduced last Friday.

(Testimony of Stephen Davidson Bechtel.)

Plaintiff's Exhibit No. 51, a letter dated February 28, 1936, in which Mr. Caldecott replied to the Six Companies' letter of February 25, has already been introduced and likewise under Plaintiff's Exhibit 52 Mr. Kaiser's letter as President of Six Companies, dated February 29, 1936, referring to the arbitration matter, was introduced in evidence.

Following the letter of February 29, 1936 the next communication that we wish to offer is a letter from Six Companies of California [1184] signed by Henry J. Kaiser, President, dated April 20, 1936, addressed to the Board of Directors of the District, and we ask that it be marked in evidence as Defendant's Exhibit QQQ. It reads:

(The letter was marked "Defendant's Exhibit QQQ.")

(Testimony of Stephen Davidson Bechtel.)

Defendant offers in evidence a letter addressed by the Joint Highway District, signed by Thomas E. Caldecott, President, to Six Companies of California, dated April 30, 1936, and ask that it be received in evidence as Defendant's Exhibit RRR. It reads: [1185]

DEFENDANT'S EXHIBIT RRR

April 30, 1936

File: Broadway Tunnel
Six Companies of California,
P. O. Box 120,
Berkeley, California.

Gentlemen:

Your letter dated April 20th, 1936, has been received.

You were advised by this Board in its reply to your letter of August 28th, 1935, and at various conferences of the Board and your representatives, which have occurred since that date, that all of the claims and contentions asserted by you in that letter were without merit, and that you were obligated to complete the work you contracted to perform under the contract dated June 4, 1934, in accordance with all of its terms.

The position of the District is now reiterated in this reply to your letter of April 20th, 1936, and you are advised that the District considers

(Testimony of Stephen Davidson Bechtel.)

that all of the claims made by you are without validity or merit, and that you are bound by your contract with the District to complete the work undertaken by you in accordance with the terms of the contract.

Yours very truly,
JOINT HIGHWAY DISTRICT NO. 13
OF THE STATE OF CALIFORNIA.
(signed) THOMAS E. CALDECOTT
President

TEC/VE

(The letter was marked "Defendant's Exhibit RRR.")

The defendant now offers in evidence a letter dated May 8, 1936, signed by Six Companies of California, by Henry J. Kaiser, President, addressed to the Board of Directors of Joint Highway District No. 13, of the State of California, and ask that it be marked as Defendant's Exhibit SSS. It reads: [1186]

(Testimony of Stephen Davidson Bechtel.)

DEFENDANT'S EXHIBIT SSS

Six Companies of California
Latham Square Building
Oakland, California

May 8th, 1936

To the Board of Directors, Joint Highway District #13 of the State of California,
1448 Webster Street,
Oakland, California.

Dear Sirs:

Pursuant to the provisions of Subsection (c) of Section IV of the Specifications for the construction of the Broadway Low Level Tunnel, said Section IV having to do with the subject of "Time", we hereby make written application for an extension of time for completion of the work covered by the contract in the amount of six hundred (600) days.

Such application is based upon the provisions of said Subsection (c) of Section IV and upon the grounds that the work has been delayed by acts of God, stormy and inclement weather, and other reasons beyond our control, which have delayed the work.

The other reasons above referred to may be made the subject of a detailed statement thereof to be submitted by us at a later date.

The making of this application is not to be deemed a waiver of any of the claims previously asserted by us and particularly as set

(Testimony of Stephen Davidson Bechtel.)

forth in our recent letter of April 20th, 1936 addressed to you.

Very truly yours,

SIX COMPANIES OF CALIFORNIA

By (signed) HENRY J. KAISER

President

[Endorsed]: Received 11.45 A. M. May 11, 1936. Joint Highway District No. 13. By L. V. Eaton (signed) Assistant Secretary.

[Endorsed]: U. S. Dist Ct. N. D. Cal. No. 20101-R. Deft's Ex. SSS. Filed April 27, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

(The letter was marked "Defendant's Exhibit SSS.")

Mr. Tinning: The defendant offers in evidence a letter addressed by Harry M. Stow, Secretary, to Six Companies of California, dated May 14, 1936; and ask it be marked "Defendant's Exhibit TTT." It reads: [1187]

DEFENDANT'S EXHIBIT TTT

May 14, 1936

Six Companies of California
Latham Square Building
Oakland, California

Attention of Henry J. Kaiser, President

Gentlemen:

At a meeting held on May 14, 1936, your letter dated May 8, 1936, applying for a six hun-

(Testimony of Stephen Davidson Bechtel.)

dred day extension of time for completion of the work to be performed under your contract with this District, dated June 4, 1934, was denied by the Board of Directors of this District on the grounds that the contractor has not been delayed in the prosecution of the work to be performed under its contract by acts of God or stormy or inclement weather, or by any reason, which in the judgment of the District Engineer has unavoidably delayed the work, or by any other reason or reasons beyond the control of the contractor which have delayed the work.

Yours very truly,
(signed) HARRY M. STOW
Secretary

HMS:HR

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's Ex. TTT. Filed April 27, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

(The letter was marked "Defendant's Exhibit TTT.")

Mr. Tinning: If your Honor please, we propose next to introduce—and which we will ask the Court to accept—23 estimates, engineers' estimates, upon which payments were made from the commencement of the contract up to the payment in May of 1936.

(Testimony of Stephen Davidson Bechtel.)

The Court: Is that the payment from month to month?

Mr. Tinning: Payments made from month to month; and then, after that, we will introduce estimates that were brought up to June 13th; and then the estimate number 25, which was submitted in July; there are 25 of those altogether, and I know I cannot finish it—I do not propose to read you them all—I may be able to finish them by 4:15 or 4:20——

The Court: If there is no question about that, if you want a record on it, cannot it be stipulated that they may be introduced without going through the form?

Mr. Tinning: I think we could put them in, but the work in that is rather considerable. I would prefer to do that in the morning, if we could. We are almost through.

Mr. Wittschen: I suggest that they do go in and not be copied. They are in much better form than if copied in the record, and they might go in by stipulation.

Mr. Marrin: I think we have copies of all of those. I suggest that they be deemed read. I do not know what they have to do with the cross-examination of this witness. In fact, I think most of this stuff has gone in out of order; but we have made no objection. [1188]

Mr. Tinning: We have our theory of this matter.

(Testimony of Stephen Davidson Bechtel.)

Mr. Marrin: It has gone so far; we are not objecting, but most of this is not cross-examination of the witness. However, as far as these estimates are concerned, you may introduce them and they may be deemed read, to save time, subject to our right to check them.

Mr. Tinning: They are photostats of the originals, so that they will not require much checking.

Mr. Wittschen: And they need not be copied.

Mr. Marrin: We will stipulate they need not be copied in the record, and deemed read; just put them in.

The Court: Either side can use them for any purpose they wish. Make your offer for the purpose of the record and to protect the record.

Mr. Tinning: Your Honor, there are 25 of these; and I think, in conformity with the agreement counsel has been good enough to make, I can set up the necessary copies. I think it is going to take me 10 minutes to divide them up and put them in; and we can do that in the morning.

The Court: Very well. We will take an adjournment now until tomorrow morning at ten o'clock.

(Thereupon, an adjournment was taken until Thursday, April 28, 1938, at 10 o'clock a. m.)

[1189]

THURSDAY, APRIL 28, 1938

STEPHEN DAVIDSON BECHTEL,

Cross Examination (Resumed).

Mr. Tinning: Q. Mr. Bechtel, were you present at a hearing before the Industrial Accident Commission of the State of California on September 24, 1935, at 2 o'clock p. m. in the State Building, San Francisco, when the matter of a safety order affecting the Broadway Low Level Tunnel was under consideration by the Industrial Accident Commission of the State of California?

A. I do not recall the date, but I attended such a meeting.

Q. Some time after the accident of August 28, 1935, and in connection with the modified section matter, in which for the progress of the work there had been an order made on the 19th of September prohibiting the resetting of timbers? A. Yes.

Q. And at that meeting do you recollect that Mr. Reardon was present, presiding as chairman, Frank C. MacDonald, one of the Commissioners of the Industrial Accident Commission, was also present, Frank J. Burke, Secretary of the Industrial Accident Commission, Mr. F. L. Lowell, Industrial Accident Commission, one of the Industrial Accident Commission safety inspectors or engineers, and Mr. L. K. Reinhardt, who also held a like position with the Commission, Mr. J. I. Ballard, Editor of the Western Construction News, Jack Norton, of the Oakland Tribune, O. W. Peterson, Six Companies of California, Thomas Soule, Chief Engineer, Industrial Indemnity Exchange, S. M. Jar-

(Testimony of Stephen Davidson Bechtel.)

rett, Safety Engineer, Industrial Indemnity Exchange—the Industrial Indemnity Exchange was your compensation insurance carrier on this job, was it not? A. Yes.

Q. J. Q. Barlow, one of the members of the Utah Construction Company, a constituent of Six Companies——

A. (Interrupting) He was one of their engineers. [1190]

Q. V. G. Hindmarsh, of Six Companies, T. M. Price, of Six Companies, George D. Whittle, United States Bureau of Public Roads, F. Modglin, the President, or he was connected with one of your constituent companies, was he not?

A. General Manager of McDonald & Kahn Company, Limited.

Q. Yourself, President of Six Companies, T. L. Phillips, who was one of your consulting engineers mentioned yesterday in connection with Mr. Tibbitts, Mr. D. Young, of MacDonald & Kahn, Mason D. Pratt, engineer for the Surety Companies on the bond, Max Thelen, attorney for Six Companies, DeLancy Smith, attorney for Six Companies, myself, attorney for Highway District No. 13, and Mr. Boggs, the engineer of Highway District No. 13. Do you remember that those persons were present at that time?

A. I do not recall each one of them, but, in general, you are correct.

(Testimony of Stephen Davidson Bechtel.)

Q. And at that time there was an official reporter present? A. I presume there was.

Q. There was a reporter there, and have you seen a transcript of the testimony?

A. I don't recall that I have or not, Mr. Tinning

Q. I will show you a copy of it. This is a copy, Mr. Bechtel, that I am showing you, and I am going to direct your attention to some matters on page 7. At that time and place were these questions or statements made to the Commission, commencing at the top of page 7:

"Mr. Tinning: I am not asking that anything be conceded. We only want our definite statement as to our position, as an excess of precaution. We waive nothing in connection with this plan. We are simply trying to state our position, not trying to put it to the side.

"Mr. Thelen: I may suggest that if references of that kind are made, we may have to introduce evidence to show that the references are not justified. We do not admit there has been any delay. [1191]

"Mr. MacDonald: I hardly think we will rule on the statement, but we will recognize and are compelled to recognize Mr. Thelen's right to file with this Commission any supplemental statement he may desire, setting forth the position of his clients.

"Mr. Thelen: I think that is very very fair."

(Testimony of Stephen Davidson Bechtel.)

Now, if you will turn to page 6, line 13:

"Mr. Boggs. (Reading):

"'The recommendation for a modification of the plan for the Broadway Low Level Tunnel which follows, is made solely because of the delay of the contractor in placing the permanent reinforced concrete tunnel lining in the portions of the tunnel bores which have been excavated, but not lined with the permanent lining called for in the plans and specifications.'"

I will return now to the remainder of Mr. Boggs' testimony on page 7:

"'These open sections of the tunnel bores are supported by temporary timber supports which have been generally intruded into the space necessary for placing the permanent tunnel lining in accordance with the Plans and Specifications. If the permanent lining had been installed promptly after excavation the present condition of the timbers would not exist.

"'To eliminate so far as practical the demonstrated hazard to the lives and safety of workmen arising from resetting the temporary timber supports, and, at the same time to provide a structure equal in strength and capacity to the original design, a modified design is recommended.

"'In making this recommendation, or in its later authorization, it is not intended in any

(Testimony of Stephen Davidson Bechtel.)

respect to admit the modification is made because of any demand, claim, or contention of the Contractor which has heretofore been communicated to the Joint Highway District No. 13 of the State of California, or to any of its officers [1192] or employees, and the District if the modification is authorized, waives none of its rights under the contract dated June 4th, 1934, with the Six Companies of California.

" 'The District Engineer recommends as a design for the permanent reinforced concrete tunnel lining for those portions of both bores of the Broadway Lower Level Tunnel, which are now excavated and supported by temporary support, and in which the permanent tunnel lining has not yet been placed, a section with an intrados crown position 10 inches lower than the present designed crown position, the position of the sides of the tunnel lining 6 inches inside of the present designed position, and to all of the dimensions shown on the preliminary plat of Joint Highway District No. 13 of the State of California, entitled, "Modification Type A Section—Sept. 21, 1935."

" 'This recommendation is that said modification in dimensions of the permanent reinforced concrete tunnel lining be authorized by the District, under all of the terms of the Contract, plans and specifications, for the sections of tunnels now open and unlined, the Contrac-

(Testimony of Stephen Davidson Bechtel.)

tor to be paid therefor at the price per lineal foot as provided in the contract of June 4, 1934 (extra concrete necessary to fill the space left by the contraction of the dimensions of the tunnel lining, to be furnished by the Contractor at its own cost), all reinforcing steel required in the construction of the modified section, to be paid for by the District at the unit price provided in the contract of June 4, 1934; the proposed modification of the tunnel lining will not apply to the portions of the tunnel bores which are already lined, nor to any portions which are not now fully excavated and supported by temporary timbering supports; and the Contractor will be required to excavate, and to install the permanent reinforced concrete tunnel lining in all [1193] parts of the bores not yet fully excavated, to the dimensions specified in the original plans and specifications, and to install proper transitions from the modified sections to the sections of lining built to the original design, and to make such alteration in location of the ceilings, flues, hangers and other details of the complete structure are determined necessary by the District Engineer to adjust such portions to the modified sections, all without any extra charge to the District, and at the prices provided in the contract of June 4, 1934.

"Before the above recommendation is finally approved by the Board of Directors of the Joint Highway District No. 13, it is sub-

(Testimony of Stephen Davidson Bechtel.)

ject to the approval by the Director of the Department of Public Works of the State of California, and the proper officials of the Bureau of Public Roads, and/or the P. W. A. of the United States, after which the Board of Directors of the Joint Highway No. 13, will act upon the recommendation for the modification.' "

Now, Mr. Bechtel, do you remember that at that hearing I have referred to that the statements which I have just read to you were made by Mr. Boggs?

A. I have a general recollection to that effect.

Q. They were substantially as appears here in this record? A. Yes.

Mr. Tinning: Do you desire this offered in evidence, this transcript?

Mr. Marrin: I think it should all go in.

Mr. Tinning: If your Honor please, we offer in evidence this transcript of the hearing, as Defendant's Exhibit UUU.

(The transcript was marked "Defendant's Exhibit UUU.")

[Set forth in the Book of Exhibits at page 403.]

Q. Subsequently, and after that hearing, on that day, Mr. Bechtel, the Industrial Accident Commission made a safety order which pro- [1194] vided that no timber in either the north or south tunnel should be removed or re-set before concreting, and except in such special instances and under such

(Testimony of Stephen Davidson Bechtel.)

conditions as the representatives of the Industrial Accident Commission or the Commission might authorize. That is true, is it not?

A. That is substantially correct.

Q. It is true, is it not? It is more than "substantially correct."

A. The words you used may not be exactly verbatim of what they provided, that is what I am referring to. I do not remember the exact words.

Q. I understand.

Mr. Tinning: If your Honor please, the defendant offers in evidence the Industrial Accident Commission Special Safety Order, requiring remedying of unsafe condition of place of employment, dated September 24, 1935, addressed to Mr. Wallace B. Boggs, District Engineer, signed by T. A. Reardon, Commissioner, and Frank C. MacDonald, Commissioner, bearing the seal of the Commission, as Defendant's Exhibit VVV.

(The document was marked "Defendant's Exhibit VVV.")

Mr. Marrin, never having had an opportunity to see a copy of the order that went to you, after what was said yesterday, I understand that you received an order in the same form addressed to the Six Companies?

Mr. Marrin: Yes, that is my understanding, it was an order in the same form.

Mr. Tinning: And at the same time?

Mr. Marrin: Yes.

(Testimony of Stephen Davidson Bechtel.)

Mr. Tinning: We have already introduced in evidence and wish to read Defendant's Exhibit VVV. Industrial Accident Commission Special Safety Order Requiring Remedying of Unsafe Condition Of Place Of Employment. September 24, 1935.

SPECIAL SAFETY ORDER REQUIRING REMEDYING OF UNSAFE CONDITION OF PLACE OF EMPLOYMENT.

September 24, 1935

To: Mr. Wallace B. Boggs,
District Engineer,
Joint Highway District No. 13,
1448 Webster St.,
Oakland, California

Whereas, it appears from the report of inspection, dated September 19, 1935, of operations, located at Broadway Tunnel, Oakland, a place of employment, made by L. K. Reinhardt, that a dangerous condition exists in said

(Testimony of Stephen Davidson Bechtel.)

place of employment, to wit: Maintenance and construction in violation of the safety orders issued by the Industrial Accident Commission of the State of California, and that Joint Highway District No. 13, is the owner or person having the custody, management, or operation of said equipment; and

Whereas, this Commission did on the 23rd day of September, 1935, serve notice on the said Wallace B. Boggs directing him to show cause, if any he had to this Commission, on or before September 24, 1935, why said recommendation of said Engineer or Inspector as set out in said report should not be complied with, and

Whereas, this Commission did, on the 24th day of September, 1935, at a hearing held in its offices in the State Building in the City and County of San Francisco, State of California, find that the requirements or recommendations of the said Engineer should be adopted as the safety requirements of the Industrial Accident Commission relative to the said place of employment,

Now, Therefore, the following special safety order is hereby made as the order of the Industrial Accident Commission relative to said place of employment confirming said inspection report and the requirements and recommendations therein contained.

It is hereby found and determined that the place of employment of said Joint Highway

(Testimony of Stephen Davidson Bechtel.)

District No. 13, consisting of a tunnel, located at Oakland, California, is unsafe and dangerous to workmen employed therein and the following precautions must be taken to render the equipment reasonably safe for the use of employees:

1. No timbering in either the north or south tunnels shall be removed or reset before concreting, except in such special instances and under such conditions as the representative of the Industrial Accident Commission or the Commission may authorize.

And the Legal Department and/or any employee of the Commission are hereby authorized to attach notice of said prohibition to said equipment and to institute any civil or criminal proceedings in the Courts which may be necessary to adequately enforce this order.

[Seal] (Signed) T. A. REARDON
Commissioner
(Signed) FRANK C. MacDONALD
Commissioner

Dated at San Francisco, California, this 24th day of September, 1935.

[Endorsed]: Received Sept. 25, 1935. Joint Highway Dist. No. 13.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's. Ex. No. VVV. Filed April 28, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

(Testimony of Stephen Davidson Bechtel.)

Gentlemen, will it be stipulated in connection with this order that both parties to the hearing received notice in advance of the hearing of the order to show cause and that both sides were represented at the hearing?

Mr. Marrin: It is so stipulated.

Mr. Tinning: Q. Mr. Bechtel, do you remember appearing at a meeting of the Board of Directors of Joint Highway District No. 13 on the 5th day of October, 1935, at which time, among other things, a request was presented to the Board to permit employment of men during the emergency following the accident 48 hours a week?

A. I remember attending one of your Board meetings in collaboration with or in company with others of our company.

Q. I am going to give you the names—at which time, accompanying you, was an employee of Six Companies, Mr. Waste, and Mr. Otto Peterson, one of the consulting engineers? A. Yes.

Q. And at which time the directors of the District, Henry L. Hinman, Harry M. Stow, and Thomas E. Caldecott were present and in session as the Board of Directors of the District, William B. Boggs, District Engineer, and Mr. C. H. Sweetser, District Engineer of the [1197] United States Bureau of Public Roads in San Francisco, and myself, were present? A. I believe so.

Q. And at that time, Mr. Bechtel, did you make a statement in substance and effect as follows to

(Testimony of Stephen Davidson Bechtel.)

the Board of Directors, that you felt that the contractor was under no legal obligation to continue to perform its contract, but that due to the fact that a number of the persons who owned interests in the Six Companies of California lived in the Bay Region, that there was a moral obligation on the part of the contractor to do the work, although the contractor had been advised by its attorneys that due to lack of knowledge of the conditions found in the excavation, which were worse than had been anticipated, that the plans and specifications and geological report constituted constructive fraud. Do you remember making that statement, in substance and effect?

A. In substance and effect. I do not remember the words "constructive fraud," but that might have been—I don't remember those words; the other part of it I do remember in substance.

Q. And that by reason of the situation the contractor would be permitted legally to withdraw from the work and recover 100 per cent. of the cost of the work performed; that the contractor intended to proceed with the work, and that large claims, running into a million or two million dollars would be pressed by the contractor against the district?

A. I think so.

Q. Did you then and at that time further state, in substance and effect, that you considered it was the duty of the District to redesign the tunnel lining to meet the conditions which you claimed were unanticipated? A. I think so.

(Testimony of Stephen Davidson Bechtel.)

Q. And were you advised then and there at that time that the district had given consideration to the claims with respect to the design and that it had heretofore advised you it was satisfied, and had advised you that the plans were proper and that the plans [1198] and specifications were clear, and that it was considered the duty of the contractor to proceed in accordance with the contract?

A. Yes, and in explanation of that, or I believe it is interesting to note that we had been held in an ante-room for some 30 or 45 minutes while you and your board met, and apparently reviewed prior to our discussion the entire matter; when we were ushered in you substantially did all the talking; nothing of any significance at all was said by any members of the Board of Directors, and this statement just made was made by you in speaking apparently for the Board. I think that is correct.

Q. But what I have asked you——

A. I answered yes, Mr. Tinning.

Q. And it is true that at that time, Mr. Bechtel, the District, and shortly following the time that you brought the consultants upon the work, had had consulting engineers? A. Yes.

Q. And you knew that they had been in conference with the people you had brought there, and on the second of September, by the letter from the District to Six Companies your contention specified in the letters of August 23 and August 28, with respect to the design, had been replied to, and you

(Testimony of Stephen Davidson Bechtel.)

had been told the District was satisfied that the design was correct, and that you should proceed under your contract? A. Yes.

Q. And you were again bringing this up on October 5? A. Yes.

Q. And during that time you had been proceeding, the Six Companies had been proceeding with the work in the tunnel? At this particular time you were not driving, you were making safe the conditions inside of the tunnel in the sense of placing additional timbers, I think it was called a safety set, or bracing to hold the timbers; you were also working vigorously on removing the place where the slide had occurred, wedging up the ground by the placing of timbers, and proceeding with all of that work during the month of September and on to October, until it was completed?

A. We proceeded to [1199] remove the caved-in section and concreted same; we also proceeded to do other work that was necessary to save the remainder of the tunnel.

Q. Which included placing concrete under the modified section, which also included the placing of concrete where the timbers had not intruded materially, or could be trimmed so that you could place the standard section without resetting timbers, and proceeded to patch up the concrete as far as possible?

A. Well, I do not think the modified section had been formally approved at that time, and it was

(Testimony of Stephen Davidson Bechtel.)

poured as rapidly and as expeditiously and as practically as possible.

Q. I am referring to the modified section, of course, after you had authority to go forward. Before that time any concrete that was placed in the tunnel was placed in accordance with the standard A section design?

Mr. Marrin: I do not think that statement is correct. It was not formally approved until November 8th, by Wallace Boggs. You are speaking about October 5th.

Mr. Tinning: I am talking about approval and I think the fact is that immediately following, or on October 2nd, that Mr. Sweetser authorized the work to go ahead under the modified section, subject to formal approval from Washington, which was received later, and our records show that the modified section commenced immediately following that date.

Mr. Marrin: The company proceeded to place the modified section immediately following the order of the Industrial Accident Commission; at this time it was not issued; it gave no formal approval until November 8, 1935.

Mr. Tinning: We will go into that later. We will prove that the approval was given and they were authorized by Mr. Sweetser to proceed at a meeting at his office, which I think was held on [1200] October 2 or 3.

Q. At any rate, you went ahead and the modi-

(Testimony of Stephen Davidson Bechtel.)

fied section was being placed about that time, and following the order of the Commission. If your Honor please, I offer in evidence regulations of P. W. A. Administrative Order 54, No. P. W. 40444, Federal Emergency Administration of Public Works, August 29, 1935, together with a letter from Thomas H. MacDonald, Chief of Bureau of Public Roads, at Washington, D. C., dated February 4, 1936, Memorandum to all District Engineers, and a letter dated March 4, 1936, from Mr. C. H. Sweetser, District Engineer, to Wallace B. Boggs, District Engineer, Joint Highway District No. 13 of the State of California, and ask that it be admitted in evidence as Defendant's Exhibit in proper order.

Mr. Marrin: If your Honor please, we object to the admission in evidence of this document. This appears to be a letter attaching a general circular with reference to liquidated damages, which was issued by the P. W. A. I want to point out to the Court that there is not a word in the contract between the plaintiff and the defendant here, respecting any authority of the P. W. A. over the granting of extensions of time or the imposition of liquidated damages. There is nothing in the contract that states that the District must secure the consent of the P. W. A. or the State of California, or any other body in order to grant an extension of time. This is a letter which was written nearly two years after the contract was entered into. And if

(Testimony of Stephen Davidson Bechtel.)

it is the contention of the defendant in this case that this is in any way binding on the plaintiff we object to its admission most strenuously on the ground that it is immaterial, irrelevant, and incompetent, and an attempt to alter and vary the terms of a written contract by a communication between this defendant and a third person. [1201]

Mr. Alexander: The surety companies make the same objection.

Mr. Wittschen: Counsel is mistaken when he says that there is nothing in the agreement between the parties that touches upon this. They expressly agreed, and I will read the section, to be bound by any orders that were promulgated by the P. W. A. We are not so much interested in the letter which accompanied it; that is a mere detail. We are interested in the ruling that was made by the P. W. A. authorities. The first thing that I want to call your Honor's attention to is the language of the agreement, itself, and if your Honor will bear with me a moment I will connect that up with the testimony of the witness. The District sent out a set of plans and specifications before this P. W. A. grant was allowed. As soon as that grant was allowed there was set up a supplemental set of specifications which supplemented the previous set. On these the plaintiff bid. The plaintiff has put in evidence as Plaintiff's Exhibit 7 the supplemental plans and specifications. This witness has testified repeatedly in connection with the limitation of plans and mak-

(Testimony of Stephen Davidson Bechtel.)

ing changes as to working conditions that he knew that the P. W. A. authority had to be obtained. If you will recall this witness' testimony of yesterday he said that he sought Mr. Boggs' aid in order to get Mr. Boggs to alleviate a restriction that you could only work 30 hours in one week. The witness also testified that the District stated it would try to get it lifted, and it made application for elimination of the provision that you could not work on Sundays and holidays, and all through this witness' testimony he has recognized that the P. W. A. was interested to the extent of one million dollars or more on this job. To say that is not binding is ridiculous, in view of their own agreement, which I am going to read now from page 4 of the supplemental specification, which states, in so far as material, "A grant of 30 per cent. of the cost of labor and materials used in the pro- [1262] ject of the District has been made by the Public Works Administration of the United States under the terms of said National Industrial Recovery Act, and all bidders are hereby advised that the Directors of the District will cooperate with the Public Works Administration and all its officers and employees in the enforcement of all of the provisions of said National Industrial Recovery Act, and rules and regulations heretofore and hereafter promulgated applicable to the performance of the work on the project of the District."

(Testimony of Stephen Davidson Bechtel.)

Now, in August, 1935, not two years after, but fourteen months after the contract was made, and when this contract had still ten months to run they promulgated a formal order, which I won't read, but which I will summarize to the effect that if the contract was not finished on time and the parties to whom the grant was made did not exact or waived the penalty clause because of failure to complete the contract on time, they did it in effect at their risk, because if the Government did not thereafter approve of this extension that then the amount so waived would be deducted from the amount that the Government otherwise would give to the party under the grant, or to state the matter in a different way, if the District did not exact this penalty when the penalty became due, then the Government, if it saw fit, could reduce the amount of grant by the amount of penalties waived. That is an order made by a body that was part of the work, where there were supplemental specifications specially made applicable to the subject, it was a ruling by the Federal authorities, and it was just as much binding on the contractor as it was binding on us. It is certainly legitimate evidence in view of this witness' testimony that he understood that these things could only be waived by the Government, and your Honor will recall further that the State [1203] gave them a 48-hour week but the Government insisted on a 40-hour week, so they had to take a 40-hour week. The Government had

(Testimony of Stephen Davidson Bechtel.)

control of the hours, and if they had control as to the hours they certainly had control as to whether or not a provision in the contract could be waived. Your Honor will also recall in connection with the modified section nothing was done until the P. W. A. said that they consented to it, because they were a party to the agreement; they were not signatories to the agreement, but they put up a million out of some three million of the amount, so you see that their rules and regulations would have to be complied with.

The Court: What is this agreement you are reading from?

Mr. Wittschen: This is a copy of the specifications which the plaintiff put in.

The Court: For the purpose of the record, what is the purpose of this offer?

Mr. Wittschen: The purpose of this offer is to show that the ruling was made prior to the res s-sion of the contract requiring the district to withhold penalties, and have that matter adjusted at the completion of the work, and not to waive them during the construction.

Mr. Marrin: Now, if your Honor please, in the first place this plaintiff was not a party to the agreement between the District and the P. W. A. with respect to the finances or any part of it, it had never seen it; it does not refer to this contract and is not made a part of the contract. Mr. Wittschen has referred to a certain section in the

(Testimony of Stephen Davidson Bechtel.)

supplement to the specifications which he has read to your Honor, and those provisions, we submit, relate entirely to the conditions surrounding the employment of labor. They relate to the number of hours that the men may be worked on the project per day and per week, and the wages that must be paid; [1264] and to say that you can extend that provision and give it the meaning that a letter from the P. W. A. can change any of the essential terms of the contract is giving it a meaning entirely beyond what was ever intended. The provisions in the contract and the specifications regarding extension of time are very clear. They are short and I might just read this portion. It says:

> "The time during which the contractor is delayed in said work by Acts of God, or by stormy or inclement weather, or by any reason which, in the judgment of the District Engineer, unavoidably delays the work, shall be added to the aforesaid time for completion, provided that the Board of Directors approve in advance the written application therefor, which must be made by the contractor for such an extension, before the expiration of the time limit fixed herein, or a duly granted extension thereof."

The effect of this letter from the P. W. A. is to state to the District that if they do not collect liquidated damages when the P. W. A. thinks they

(Testimony of Stephen Davidson Bechtel.)

should have collected them, then that amount would be deducted from the grant. Now, I submit to your Honor that that does not constitute itself any justification for denying an extension of time when the contractor was entitled to it under the terms of the contract, and I submit further that this so-called amendment to the specifications does not have the meaning which the defendant attempts to give it.

The Court: I am prepared to rule.

Mr. Wittschen: I just want to make one observation. It is not the letter we are introducing. I do not want your Honor to be confused. We are introducing an order which was made by the Assistant Administrator, acting for the Administrator, which was not promulgated as to this job, but as to all jobs in which the P. W. A. is interested, pending all over the United States. It is not a [1205] letter, counsel is misconstruing that, and these specifications that I have read do not refer only to employment of labor, they refer to all rulings of the P. W. A., and to say that the P. W. A. is not a party to this contract in view of the close relation they have had all the way through—you could not even drop a timber ten inches without their consent—is carrying the argument too far. It is an act of an executive branch of the Government of which the Court takes judicial notice.

The Court: The Court is prepared to rule. I am going to allow it to be admitted, subject to a motion

(Testimony of Stephen Davidson Bechtel.)

to strike, and over the objection of counsel, so that you can take it up at some future time and discuss it at length.

Mr. Marrin: Note an exception.

Mr. Alexander: We also note an exception.

Mr. Marrin: I would like to have the further ground of objection that it is not proper cross-examination of this witness.

Mr. Alexander: We join in the additional objection.

Mr. Tinning: Now, under the order that is made, do you wish us to offer all of these documents, or simply the matter the Court ruled on?

Mr. Marrin: I think they should all go in.

Mr. Wittschen: We are only interested in the order.

Mr. Smith: It shows on the face of it we did not get it until March, 1936.

Mr. Tinning: That is correct. We did not exact the penalty until June, 1936. The offer has been made and objected to, and admitted, and I offer it as Exhibit WWW.

(The document was marked "Defendant's Exhibit WWW.")

(Testimony of Stephen Davidson Bechtel.)

DEFENDANT'S EXHIBIT WWW.

United States Department of Agriculture
Bureau of Public Roads, District No. 2
461 Market Street, San Francisco, Calif.

March 4, 1936

In your reply please refer to
File: 483 Calif. 2231
Mr. Wallace B. Boggs, District Engineer
Joint Highway District No. 13
1448 Webster Street
Oakland, California.

Dear Sir:

I am enclosing a copy of Memorandum to all District Engineers, dated February 4, 1936 to which is attached Administrative Order No. 54 (Supplemental) of the Federal Emergency Administration of Public Works.

This order has to do with the procedure governing liquidated damages. For projects under the administration of the Bureau of Public Roads, the title "State Director" shall be interpreted to mean "District Engineer, U. S. Bureau of Public Roads."

Yours very truly,
(Signed) C. H. SWEETSER
District Engineer.

Enc.

United States Department of Agriculture
Bureau of Public Roads, Washington, D. C.

February 4, 1936

MEMORANDUM TO ALL DISTRICT ENGINEERS.

We are enclosing copies of Administrative Order No. 54 (Supplement 1) of the Federal Emergency Administration of Public Works.

This order applies to projects transferred to this Bureau by the Public Works Administration.

In the administration of PWA dockets by this Bureau, the same procedure governing liquidated damages as is now in effect under the Bureau's regulations will be followed.

THOS. H. MacDONALD
Chief of Bureau.

Enclosure.

P. W. 40444

Federal Emergency Administration of Public Works

August 29, 1935

Administrative Order No. 54 (Supplement 1)

SUBJECT: CONSTRUCTION CONTRACTS, LIQUIDATED DAMAGES ON

This Administration has adopted the policy of deducting from the grant base the sum equal to the liquidated damages which the borrower or grantee could have assessed against the con-

(Testimony of Stephen Davidson Bechtel.)

tractor or contractros for delay in completion, pursuant to the terms of the construction contracts, but which the borrower or grantee failed to deduct for reasons which this Administration considers inadequate.

Therefore, in order to expedite final payment of the grant, the following procedure shall be followed where a construction contract provides for liquidated damages.

As to those contracts which have not yet been completed, the State Directors shall ascertain, if possible, prior to the expiration of the time limit fixed in the contract, whether additional time will be required to complete the contract, and, if so, whether the borrower or grantee intends to waive liquidated damages, and, if so, its reasons therefor. In the event that the borrower proposes to waive such damages, the State Director should forward such information to Washington with all pertinent data, his recommendation and supporting information as to whether an extension of time should be allowed the contractor.

If, on contracts which have been completed, the borrower or grantee has already waived liquidated damages, the State Director shall require the borrower or grantee to furnish him with its reasons for such action and shall transmit such information to the Central Office with

(Testimony of Stephen Davidson Bechtel.)

all pertinent facts and his recommendation to the action taken.

After review of the information submitted pursuant to this order, the State Director will be advised of the approval or disapproval of the Central Office of the proposed action or of the action taken, as the case may be.

(Signed) HORATIO B. HACKETT
Assistant Administrator.

Engineering
Distribution:
General

[Endorsed]: Received March 7, 1936. J. H. D. #13.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's. Ex. WWW. Filed April 28, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

If your Honor please, the defendant offers in evidence and suggests that they be received as one exhibit, Estimates Nos. 1 [1206] to No. 23, engineering estimates upon which monthly progress payments were made, commencing with No. 1, which was issued for the period from June 4 to June 30, 1934, and closing with Estimate No. 23, which was issued for the period from April 1, 1936 to April 30, 1936. We ask that these be admitted as one exhibit.

(Testimony of Stephen Davidson Bechtel.)

The Court: Let them be admitted and marked.

(The estimates were marked "Defendant's Exhibit XXX.")

[Set forth in the Book of Exhibits at page 435.]

Mr. Tinning: Defendant now offers in evidence Estimate No. 24 covering the period from May 1 to May 31, 1936, accompanied by a copy of the letter transmitting the estimates and a photostatic copy of the check from the District to the Six Companies of California, Check No. 1934, dated June 10, 1936, for $148,586.98. This check was sent to the Six Companies with the estimate referred to and, gentlemen, so that there will be no mistake, I call your attention to some writing that appears on the face of the photostatic copy of the check, which was made recently, "Cancelled, Board of Directors, May 31, 1937," and similar endorsements have been put on the check that went in July to the Six Companies, because it was necessary for the District to cancel these checks, as the evidence will show, and they were returned to the District.

Mr. Wittschen: Will it be stipulated that when they were sent they were not marked "Cancelled," and they were only cancelled after you returned them?

Mr. Marrin: It will be stipulated that when these checks were received by the Six Companies that writing was not upon them.

Mr. Tinning: We offer this Estimate No. 24 and

(Testimony of Stephen Davidson Bechtel.)

the check, and the copy of the letter as Defendant's Exhibit YYY.

(The estimate was marked "Defendant's Exhibit YYY.")

[Set forth in the Book of Exhibits at page 458.]

[1207]

Mr. Tinning: We offer in evidence, if your Honor please, as Defendant's Exhibit in proper order, a letter from Six Companies of California, signed by Henry J. Kaiser, President, to Joint Highway District No. 13 of the State of California, and dated June 13, 1936, and ask that it be marked in evidence Defendant's Exhibit ZZZ. It reads:

[1208]

DEFENDANT'S EXHIBIT ZZZ.

Builders of Broadway Low Level Tunnel
Six Companies of California
1522 Latham Square Building
Oakland, California
Highgate 6334

June 13, 1936

Joint Highway District No. 13
of The State of California,
1448 Webster Street,
Oakland, California.

Gentlemen:

You are hereby notified that the undersigned, Six Companies of California, has elected to

(Testimony of Stephen Davi[illegible]on Bechtel.)

and does hereby terminate and rescind the contract dated June 4, 1934, between the undersigned and your District for the construction, erection and completion of the project of said Joint Highway District No. 13 of the State of California, which includes a highway, highway tunnels, and approaches with the appurtenant structures located partly in the City of Oakland, County of Alameda, State of California, and partly in the County of Contra Costa, State of California, commonly known as the Broadway Tunnel Project.

Said rescission is made upon the following grounds and each and all of them:

First: Through your fault the consideration for our obligations under said contract has failed in part in that you have failed and refused to pay us the amount estimated by you to be due us under the monthly estimate for work done during the month of May, 1936. Said failure consists in the deduction by you from the amount estimated by you to be due us for such work of the sum of $3,500 for claimed damages for failure to complete the work under said contract, said deduction being computed at the rate of $500 per day for each day in May 1936 following May 24th, and to and including the 31st day of May, and including such a deduction for a legal holiday, May 30, and a non-working day, Sunday, May 31st. Said deduc-

(Testimony of Stephen Davidson Bechtel.)

tion was and is contrary to and in violation of the terms of the contract in that we were and are entitled as a matter of right and of law to an extension of time thereunder for performance of same to a date after May 31, 1936; and was and is further in violation of the provisions of the said contract in that any damages for delay in completion of the contract can only be asserted or claimed against the contractor for working days after the contract date for completion.

Second: That the consideration for said contract has failed in a material respect in that you have breached said contract by refusing to pay us the amount due us under your monthly estimate for work done during the month of May, 1936. Said failure consists in the deduction by you from the amount due us for such work of the sum of $3,500 for claimed damages for failure to complete the work under said contract within contract time, said deduction being computed at the rate of $500 per day for each day in May, 1936 following May 24th, and to and including the 31st day of May, and including such a deduction for a legal holiday, May 30th, and a non-working day, Sunday May 31st. Said deduction was and is contrary to and in violation of the terms of the contract in that we were and are entitled as a matter of right and of law to an extension of time thereunder

(Testimony of Stephen Davidson Bechtel.)

for performance of same to a date after May 31, 1936; and was and is further in violation of the provisions of the said contract in that any damages for delay in completion of the contract can only be asserted or claimed against the contractor for working days after the contract date for completion.

Third: That in failing to pay said sum mentioned in numbered paragraphs First and Second above and by your refusal to grant said extension of time you have breached said contract, and ground for rescission has arisen in our favor.

Fourth: That your failure and refusal to grant us the extensions of time to which we are entitled as a matter of right and of law for completion of said contract after May 24, 1936, although we have repeatedly requested the grant of such extensions is a breach of the contract.

Fifth. Because the ground encountered in the excavation for the tunnels provided for in the contract has been and is entirely and radically different from the character of ground represented to the contractor as that which would be encountered, and which was contemplated and predicted by the contract, geological report, specifications, plans and any and all other documents forming a portion or part thereof.

Sixth: For your failure and refusal to furnish points, lines and grades for us to work to

(Testimony of Stephen Davidson Bechtel.)

and other engineering work in the construction of the tunnels as is required to be done or furnished by you by the terms and provisions of the contract and specifications forming a part thereof.

Seventh: Because the work which is necessarily required to be done to construct the tunnels under the ground conditions actually encountered at their site is not provided for in the contract and was not contemplated by the parties at the time the contract was made.

Eighth: For any and all other grounds of rescission of said contract of June 4, 1934 which may have heretofore existed or which do now exist in favor of the undersigned.

We are returning herewith to you your check #1934 dated June 10, 1936 in purported payment of the estimate for the work done by us during the month of May, 1936.

Very truly yours,
SIX COMPANIES OF
CALIFORNIA
By (Signed) HENRY J. KAISER
President.

[Endorsed]: Received June 15, 1936. Joint Highway Dist. No. 13. Personally handed to me at 9:40 a. m. June 15, 1936. Wallace B. Boggs.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's. Ex. No. ZZZ. Filed April 28, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

(Testimony of Stephen Davidson Bechtel.)

I think it may be stipulated that this letter of rescission was personally delivered to Wallace B. Boggs, at 9:40 a. m., on June 15, 1936, and that also a letter was mailed on June 13, the date that this letter bears, which contained a copy of this same letter, a duplicate original, we may call it, and it was received by mail by the District on June 15, 1936.

Mr. Marrin: That will be stipulated to, and will it be stipulated that the check which was introduced as a part of Defendant's Exhibit YYY was returned to the District?

Mr. Tinning: As stated in the letter and received by the District with this letter.

Mr. Marrin: And subsequently cancelled?

Mr. Tinning: And subsequently cancelled. I want the stipulation with respect to the cancellation, that it was cancelled on the 31st of May, 1937, more than one year afterward.

Mr. Marrin: Yes. I just wanted it clearly stipulated that the check was never paid by the District.

Mr. Tinning: I would like to offer in evidence as Defendant's Exhibit A-4 a letter dated June 15, 1936, signed by Six Companies of California, Henry J. Kaiser, President, addressed to the District. It reads as follows: [1211]

(Testimony of Stephen Davidson Bechtel.)

DEFENDANT'S EXHIBIT A-4.

Builders of Broadway Low Level Tunnel
Six Companies of California
1522 Latham Square Building
Oakland, California
Highgate 6334

June 15, 1936

Joint Highway District No. 13
Of The State of California,
1448 Webster Street,
Oakland, California.

Gentlemen:

Having rescinded our contract with you dated June 4, 1934, for the reasons heretofore stated in a notice of rescission dated June 13, 1936, and heretofore delivered to you, we have ceased all operations under said contract.

In order to protect temporarily the work which has been done, and for that purpose only, we are continuing to operate the pumps and keep watchmen at the site for a sufficient time to enable you to take over these operations.

You are notified that, except for such watchmen as are necessary to protect our own property, we will remove all our employees from the site of the work, including those operating the pumps and watching your property, at midnight Tuesday June 16, 1936. If you desire the pumps operated and the property guarded after that time you must arrange to carry on this

(Testimony of Stephen Davidson Bechtel.)

work with your own employees and solely at your own cost and risk.

Very truly yours,
SIX COMPANIES OF CALIFORNIA

By (Signed) HENRY J. KAISER
President.

[Endorsed]: Received June 15, 1936. Joint Highway Dist. No. 13. By Received 2:35 p. m. Wallace B. Boggs.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's. Ex. No. A-4. Filed April 28, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

(The letter was marked "Defendant's Exhibit A-4.")

The Court: We will take a recess for a few minutes.

(After recess):

Mr. Tinning: Q. Mr. Bechtel, if I understood your testimony on direct you ceased to be president of Six Companies, the plaintiff in this case, on or about the 29th of February, 1936? A. Yes.

Q. That was a few days following the slide that occurred on the 22nd, or the cave-in that occurred on the 22nd of February, 1936? A. Yes.

(Testimony of Stephen Davidson Bechtel.)

Q. And after that time Mr. Kaiser became president and continued as president of the company? A. Yes.

Q. You were connected with the company thereafter, were you not?

A. I continued to be a director.

Q. Were you out around the work after that time? A. Not a great [1212] deal.

Q. In other words, you were not as closely connected with the work after that as you had been when president of the company?

A. That is correct.

Q. Don't you know as a matter of fact that every day in May of 1936 after May 24th that Six Companies' men worked on the work driving the Broadway Low Level Tunnel up till and including June 1, both Sunday and Memorial Day?

A. No, except as hearsay.

Q. You do not question it as a fact that the records of the company show that the men were working, full crews, on those days?

A. I do not question that they were working, but as far as my personal knowledge goes, or having examined the records, I do not know, but I presume they did work.

Mr. Tinning: You will stipulate, gentlemen, will you not, that the men and crews actually worked on Memorial Day, May 30, 1936, and on Sunday, May 31?

(Testimony of Stephen Davidson Bechtel.)

Mr. Marrin: I think so, but we will have to check the records on that.

Mr. Tinning: I did not want to waste time on that if we could avoid it. I am positive they did.

The Court: It may be stipulated subject to correction after examination of the records.

Mr. Tinning: It is stipulated subject to correction?

Mr. Marrin: That the men did work?

Mr. Tinning: Yes.

Mr. Marrin: Yes.

Mr. Tinning: Q. Mr. Bechtel, from these letters that were written here it appears that on June 13 notice of rescission was actually sent out, and as a matter of fact that was Saturday night, was it not? A. I do not recall.

Q. Weren't you present at a meeting of the Board of Directors at [1213] which the action of the Six Companies was decided upon, and to serve this notice of rescission?

A. If there was a meeting of the Board of Directors so held then, and I believe such a meeting of the Board of Directors was held, but so far as being at any meeting on any Saturday night, I do not think any meeting was held, and if so I was not there.

Q. I was not there, but I understand that there was a meeting held of the Board of Directors of Six Companies, of which you were a member, on the 13th day of June, 1936, the day that the notice

(Testimony of Stephen Davidson Bechtel.)

of rescission was given. Were you present at that meeting?

A. In June, and about that time, a meeting was held; as to the time, place and day I am not clear on right now. I will check the records on that.

Q. Mr. Bechtel, do you mean to say that you have not any recollection of the meeting at which the action was taken by the Board of Directors?

A. I said I attended such a meeting, but the time and place I do not remember.

Q. Wasn't it the same day that this rescission notice was given?

A. I don't know whether it was or not.

Q. Isn't it a fact that the meeting started sometime in the day and continued through the afternoon and evening till sometime around ten o'clock at night? A. I have no such recollection.

Q. You have no such recollection?

A. No.

Q. Were you present in the room of the directors when Mr. Paul St. Sure, one of your attorneys, telephoned to me at 10:45 P. M. on June 13 and said he was closing down the job at 11 o'clock?

A. I have no such recollection.

Q. You did not have that in mind when you testified yesterday you were driven off the work?

A. The telephone conversation?

Q. Yes.

A. As I say, I do not recall any such telephone conversation. [1214]

(Testimony of Stephen Davidson Bechtel.)

Q. You did not have in mind the action of Six Companies in ceasing work occurring at 10:45 p. m. on the night of June 13, 1936?

A. The comment I made that we were driven off the work came to my mind because of the action of the District in deducting or penalizing us for not having completed in accordance with the original date of the contract, and after we had been assured or told that we were entitled to an extension of time, and when you assessed these penalties, in my mind, it was a breach of faith; it was not in accordance with the understanding or the thought or the assurance which I felt we had been given, and which in turn I had reflected up to that time to our board of directors, that we had been told that we were entitled to an extension of time, it was just a question of when and the amount.

Q. You were a member of the directors in May, 1936? A. Yes.

Q. You were a member of the Board of Directors at that time when you applied for an extension of time of 600 days, were you?

A. I have been a director of Six Companies of California since its inception, or since May 15, 1934, up to and including to-day.

Q. You had cognizance of the fact that on May 8, 1936, Six Companies applied for a 600-day extension of time?

A. No, I did not. As a matter of fact, until recently here I did not know that an application had

(Testimony of Stephen Davidson Bechtel.)

been made to the extent of 600 days, and I understood that such application was to be made, and an application was being made by Mr. Kaiser, that was a matter which had been referred to Mr. Kaiser for handling by the Board of Directors, and Mr. Kaiser kept the Board of Directors generally informed of the important matters.

Q. You knew then, following May 8th, and on May 14, that the District had denied your application? A. No, I did not.

Q. You did not? A. No.

Q. So when you attended the meeting on June 13 and you knew that [1215] a penalty had been assessed you did not know that the application for 600 days extension of time had been denied a month before?

A. I knew that an application had been made, I was told that at some period in between those dates, I do not recall the exact date, that an application had been made and the application had been denied; I did not know the extent or the days involved.

Q. Did you know that after the application was denied that Six Companies made any request of the District to waive the penalty or to await the determination as to whether or not the penalty would be waived until the job was completed?

A. No, I did not know that, and I do not know it now.

(Testimony of Stephen Davidson Bechtel.)

Q. You don't know whether it ever happened?

A. I don't know whether it ever happened. The matter was handled by Mr. Kaiser.

Q. Did he ever report to you as a member of the Board of Directors that he had communicated or written and asked them to waive the matter of imposing the penalty until the job was done, when it might be fought out or threshed out and determined?

A. I knew of no such communication but it might have taken place.

Q. You don't know that?

A. I don't know that.

Q. As a matter of fact, it never took place?

A. I don't know that it took place or not.

Q. Now, it is a fact that the work was shut down at 11 p. m. on the night of June 13, 1936, is it not? A. I understand that.

Q. On Saturday night, and that the warning of shut-down was just fifteen minutes of notice was given to me by Mr. St. Sure, one of your attorneys?

A. I don't know that.

Q. You don't know that? A. No.

Q. You don't doubt it, do you?

A. If you say it is so it must be.

Q. And we got the letter of rescission on Monday morning, the 15th of June, 1936?

A. You so testified this morning.

Q. You have been following the testimony very closely. [1216]

(Testimony of Stephen Davidson Bechtel.)

We offer in evidence as Defendant's Exhibit B-4 a letter dated June 16, 1936, addressed by Joint Highway District 13 to Six Companies of California, and ask that the letter be admitted in evidence. It reads as follows: [1217]

DEFENDANT'S EXHIBIT B-4.

June 16, 1936

Six Companies of California
1522 Latham Square Building
Oakland, California

Gentlemen:

Your letter of June 13, 1936 in which you notified this District of a purported termination and rescission of your contract with this District dated June 4, 1934, has been received and considered by the Board of Directors of the District, and this reply thereto is made at the direction of the Directors of the District.

You are hereby advised that Joint Highway District No. 13 of the State of California considers all of the grounds stated by you as a basis for your attempted rescission and termination of the contract are without basis in fact or law; that this District has fully paid all sums required to be paid, performed and done all things required to be performed and done by it under the said contract, and that you, as such contractor, have no valid grounds

(Testimony of Stephen Davidson Bechtel.)

or reason whatsoever for your attempted rescission and termination of the contract.

You are advised that your cessation of work upon the project and your withdrawal of workmen from the construction of the project constitutes an abandonment by you of the work to be done under the contract; that your said acts which unnecessarily and unreasonably delay and continue to delay the work you contracted to perform, and your attempted rescission and termination of the contract, and each and all of them, constitute wilfull breaches of the contract by you.

You are further advised that unless you as said contractor resume work on the project and perform the same in accordance with all of the terms thereof within three (3) days of the date of your receipt of this letter, that this District will consider your acts and conduct as aforesaid a final abandonment of the contract and the work to be done thereunder, and the District will proceed to complete the same in accordance with the provisions of the contract, and that the District will hold you and your bondsmen liable for any and all costs thereof in excess of the contract price and any and all damages to this District by reason of your wilfull abandonment of the work in violation of

the terms of your contract with this District dated June 4, 1934.

Yours very truly,
JOINT HIGHWAY DISTRICT NO. 13 OF THE STATE OF CALIFORNIA,
By (Signed) L. V. EATON
Assistant Secretary

cc to all bonding companies

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's. Ex. No. B-4. Filed April 28, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

(The letter was marked "Defendant's Exhibit B-4.")

Gentlemen, will it be stipulated that a similar letter was sent by the District to all of the sixteen bonding companies which were sureies on the bond in this matter under date of June 16, 1936?

Mr. Alexander: That is the fact.

Mr. Tinning: And that said letter was received by all of the bonding companies? We have a return receipt to that effect.

Mr. Alexander: Yes, it is stipulated that a copy of the letter that you wrote was sent to the sixteen surety companies and received by them.

Mr. Tinning: And also the copy was accompanied by this letter?

Mr. Alexander: So stipulated.

(Testimony of Stephen Davidson Bechtel.)

Mr. Tinning: The letter which was sent to all of the bonding companies, which it has been stipulated was received, we will ask [1218] to be introduced and marked as Defendant's Exhibit C-4. It reads as follows: [1219]

DEFENDANT'S EXHIBIT C-4

June 16, 1936

Hartford Accident and Indemnity Co.,
720 California Street,
San Francisco, California,

Gentlemen:

Enclosed herewith please find a copy of a letter addressed to the Six Companies of California, contractor under the contract dated June 4, 1934, with this District, which is sent you that you as one of the co-sureties on the bond securing materialmen and laborers and the bond for faithful performance furnished with and forming a part of the said contracts, may as such surety be advised of an attempted rescission and termination of the contract and work thereunder by the contractor, Six Companies of California, and of the fact that this District considers said action an abandonment of the work by the contractor.

You will please advise this District if you and the other co-sureties under said bonds elect to proceed with the completion of the work

(Testimony of Stephen Davidson Bechtel.)

which the contractor is attempting to repudiate, and if you do not advise this District within three (3) days of the date of your receipt of this letter that the bondsmen intend to perform the remainder of the work under the terms of the contract, the District will proceed to perform the work and pay for the same in accordance with the terms of the contract, holding the contractor and all of the sureties on said bonds liable for any cost in excess of the contract price, and any and all damages to the District by reason of the wilfull abandonment of the work by the contractor and its failure to perform the same, and from any and all other causes proper under the contract.

Yours very truly,

JOINT HIGHWAY DISTRICT NO. 13 OF THE STATE OF CALIFORNIA,

By L. V. EATON,

Assistant Secretary.

(Identical letter addressed to each bonding company.)

(Testimony of Stephen Davidson Bechtel.)

Name of Surety	Percentage of Liability	Amount of Liability
Hartford Accident and Indemnity Company, a Connecticut Corporation	10%	$184,200.00
Fidelity and Deposit Company of Maryland, a Maryland Corporation	10%	184,200.00
The Aetna Casualty and Surety Company, a Connecticut Corporation	10%	184,200.00
Indemnity Insurance Company of North America, a Pennsylvania Corporation	10%	184,200.00
American Surety Company, a New York Corporation	10%	184,200.00
Fireman's Fund Indemnity Company, a California Corporation	7%	128,940.00

TOTAL	100%	1,842,000.00

[Endorsed]: U. S. Dist. Ct., N. D. Cal. No. 20101-R. Deft's Ex. No. C-4. Filed April 28, 1938. Walter B. Maling, Clerk, by J. A. Schaertzer, Deputy Clerk.

(Testimony of Stephen Davidson Bechtel.)

(The letter was marked "Defendant's Exhibit C-4.")

Now, gentlemen, will it be stipulated on the part of counsel for plaintiff, the Six Companies, that they did not return to work within three days or any other time?

Mr. Marrin: It is so stipulated.

Mr. Tinning: And on behalf of the surety companies, Mr. Alexander, will it be stipulated that following the receipt of this notice none of the surety companies took over the work and proceeded with the completion of the work?

Mr. Alexander: So stipulated.

Mr. Tinning: Defendant offers in evidence a letter dated July 9, 1936, addressed to Six Companies of California, together with Estimate No. 25 of the District Engineer, covering the work from June 1, 1936, to June 13, 1936, the estimate having been filed or issued as of July 9, 1936, together with a check of the district in payment of the amount of the Engineer's Estimate for the work during the period from June 1 to June 13, 1936, the check being numbered 2201 of the District, and being for the sum of $80,715.66, and covering the Engineer's Estimate which deducted the penalty of $500 a day for the thirteen days in June, which the contractor worked. We offer the letter, the estimate, and the check as one exhibit, D-4.

(The letter was marked "Defendant's Exhibit D-4.")

(Testimony of Stephen Davidson Bechtel.)

Under the terms of the contract, your Honor, the contractor was entitled to payment for the work in the preceding month based upon an engineer's estimate, and the making of progress payments on or about the 10th day of the succeeding month.

The Court: Coupled with the fact that there was a deduction for penalty in this case and in May?

Mr. Tinning: 7 days on May and 13 days in June. [1220]

The letter reads as follows:

[Set forth in the Book of Exhibits at page 461.]

Now, the check accompanying this Exhibit D-4 bears a similar notation that was written upon the face of it thereafter. May it be stipulated that when the check was sent to Six Companies, the plaintiff in this case, that there was no such notation on it?

Mr. Marrin: So stipulated.

Mr. Tinning: And may it also be stipulated, as stated in the letter, that the check which had been first sent to the Six Companies on June 10, 1936, was also included and enclosed and tendered again; in other words, that there was a second tender of the check?

Mr. Marrin: Yes.

Mr. Tinning: Both payments. [1221]

Mr. Marrin: Will it also be stipulated that the District never tendered the amount of $3500 for May and the amount of $6500 for June, the deduction penalty?

(Testimony of Stephen Davidson Bechtel.)

Mr. Tinning: I will stipulate to that, the proof is unequivocal, that they did not.

We offer in evidence a letter dated July 15, 1936, from Six Companies of California, signed by Henry J. Kaiser, President, to Joint Highway District No. 13, which we ask be marked "Defendant's Exhibit E-4. It reads as follows:

DEFENDANT'S EXHIBIT E-4

Builders of Broadway Low Level Tunnel
Six Companies of California,
1522 Latham Square Bldg.,
Oakland, California.
Higate 6334
July 15, 1936

Joint Highway District #13
of the State of California,
1448 Webster Street,
Oakland, Calif.

Gentlemen:

We hereby acknowledge receipt of your check No. 1934 in the amount of $148,586.98 and also your check No. 2201 in the amount of $80,715.66 dated June 10, 1936, and July 9, 1936, respectively.

By notice dated June 13, 1936, and heretofore delivered to you, the undersigned rescinded said contract for the reasons and upon the grounds stated in said notice.

(Testimony of Stephen Davidson Bechtel.)

Said checks are hereby returned to you.

Very truly yours,

SIX COMPANIES
OF CALIFORNIA,

By (Signed) HENRY J. KAISER, Pres.

By T. M. PRICE.

T. M. Price/w

Receipt of the checks described within is hereby acknowledged this 15th day of July, 1936.

JOINT HIGHWAY DISTRICT NO. 13,

By (Signed) W. B. B.

[Endorsed]: Received July 15, 1936. Joint Highway Dist. No. 13. 3:45 p. m.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Deft's. Ex. E-4. Filed April 28, 1938. Walter B. Maling, Clerk, by J. A. Schaertzer, Deputy Clerk.

(The letter was marked "Defendant's Exhibit E-4.")

Q. Mr. Bechtel, returning now to your testimony respecting the conversation or statement——

Mr. Marrin: Mr. Tinning, before you go on would you stipulate that the District did not at any time send to the plaintiff in this case any of the letters or documents that have been intro- [1222] duced as Defendant's Exhibit WWW?

Mr. Tinning: That is the P.W.A. letter?

(Testimony of Stephen Davidson Bechtel.)

Mr. Marrin: Yes.

Mr. Tinning: Yes.

Q. As I understood your testimony respecting your conversation with Mr. Boggs during April or May, 1935, or as near as you can place that conversation, it was in that period you testified, April or May, you have not the specific date when it occurred? A. That is right.

Q. You kept no memorandum of the conversation? A. That is right.

Q. Now, Mr. Bechtel, is it not a fact at this conversation which occurred just before the noon hour, at the front steps of Six Companies office, near the west portal, I think you called it the job office, that is what we are referring to, in addition to yourself and Mr. Price and Mr. Boggs, that Prof. Charles Derleth, Jr., of the University of California, one of the District's consultants, was present?

A. That is not correct.

Q. That is not correct? A. No.

Q. Isn't it a fact that you only had one conversation with Mr. Boggs at any time in April or May, 1935?

A. I would not say that is correct.

Q. Have you any memoranda or records that indicate that you had more than one conversation with him during that period? A. No.

Q. Have you got any memorandum of any conversation with Mr. Boggs?

A. Written at the time, do you mean?

(Testimony of Stephen Davidson Bechtel.)

Q. Written at the time. A. No.

Q. Why did you say you are uncertain that you had more than one conversation with Mr. Boggs in April or May, 1935?

A. Because from time to time I was on the job and saw Mr. Boggs there, and at times exchanged pleasantries, and other times discussed the job in generalities, and that is my reason for saying it might have [1223] been the case.

Q. Mr. Bechtel, is it not a fact, and was it not a fact that the conversation that you referred to occurred on May 21, 1935?

A. I don't recall the date.

Q. Do you recall that it occurred shortly before the noon hour?

A. No, I think, on the other hand, it occurred some place probably between 9 and 9:30 or ten o'clock, and the reason I say that is it was my practice or custom usually to leave home sometime between 6:30 and 8:30, and coming to San Francisco via the job, when I was going to the job, and very seldom came out that late.

Q. Then you are fixing the time by reason of your custom and not by any independent recollection of what occurred on the day of the conversation which you testified to?

A. That is correct.

Q. You have no notes made of it at the time?

A. No.

(Testimony of Stephen Davidson Bechtel.)

Q. Isn't it a fact that this conversation occurred, you and Mr. Price were near the job office, and that Prof. Derleth and Mr. Boggs came out of the tunnel just before noon and walked down toward you and met you at the job office?

A. Not this discussion, Mr. Tinning; you might be thinking of some other pleasantries or general conversation, but not this discussion.

Q. I am not talking about any pleasantries, I am talking about conversation.

A. There were pleasantries, but this discussion was held in front of the job office, in front of the steps, in fact, we sat on the front steps a portion of the time; there were only three people there, there was Mr. Tom Price, Mr. Boggs, and myself. Prof. Derleth was not there.

Q. Isn't it a fact at this time and place that this conversation occurred, that the conversation was opened after you greeted them, greetings back and forth by Prof. Derleth telling you that he was very much surprised about your delay in installing concrete lining in the tunnel, the timbers had been standing a long time and that [1224] you ought to get the concrete going as soon as possible?

A. No.

Q. Did he ever tell you that at any time?

A. As you state it, no.

Q. Or in substance and effect?

A. There was a conversation——

(Testimony of Stephen Davidson Bechtel.)

Q. Will you answer "Yes" or "No," and then explain? A. No, not as you stated.

Q. Will you tell us what he did say, and first tell us when?

A. I would place it some place in the month of July, Prof. Derleth and I happened to meet some place on the job, and he commented with the thought the tunnel lining or concrete should be expedited, or as rapidly as possible. I told him that was correct, that was our purpose, and we were proceeding accordingly. That, in substance, was the discussion I had with Prof. Derleth.

Q. This was in July?

A. I think it was some time in July.

Q. It was after the concreting started?

A. That would be approximately correct.

Q. July 2 was when you started pouring the first concrete footings in the tunnel after December, 1934?

A. If you say that was the date, it was during the month of July, you would be correct.

Q. Then was your conversation with Prof. Derleth before you started pouring the concrete in the tunnel or afterward?

A. I would say it was during the month of July.

Q. Would you answer my question?

Mr. Marrin: I think he answered the question perfectly clearly. He fixed the time and fixed the occasion.

(Testimony of Stephen Davidson Bechtel.)

Mr. Tinning: Q. Was the conversation which you had with Prof. Derleth that you have referred to before or after the concrete pouring was started in the tunnel? A. I do not recall.

Q. Did you make any note of that conversation?

A. No.

Q. Isn't it a fact that at the time and place mentioned, May 21, Prof. Derleth also told you that for a long time he had been telling [1225] Six Companies' representative on the job that the concreting should not be delayed, and that he wanted to impress upon you, mentioning you as president of the company, that you should get the concrete lining in at once?

A. I do not think any part of that is correct. I have no recollection of such a conversation, and I do not believe he ever told me that at that time, or at any other time.

Q. You knew that Prof. Derleth was one of the consultants of the District, who had been in the District and had been on the job practically all the time the work was under way?

A. You say all the time. He had been there occasionally, maybe once a month, and maybe once every two months. As a matter of fact, if I recall correctly, he had not been there very often up until about the time of the unfortunate cave-in of August 28th.

Q. Your recollection is that Prof. Derleth had

(Testimony of Stephen Davidson Bechtel.)

not been around the work there very often until just about the cave-in of August, 1935?

A. I think that is correct. That is my recollection. You asked me something that I have not thought of.

Q. That would be subject to correction if he had kept a record of it? A. Absolutely.

Q. You don't know?

A. He might have been, when I did not see him, but as far as my recollection or knowledge goes I have no recollection of it.

Q. You knew he was one of the original designers of this tunnel section?

A. No. He was there as a consultant. I doubt very much whether he was one of the designers, because consultants usually do not do the designing, they do the consulting generally.

Q. You don't know whether or not Prof. Derleth was one of the men who participated in the design of the tunnel section, both A and B? A. No.

Q. That was finally excavated?

A. His name was on the outside of the big volume of plans, in large letters. [1226]

Q. Did it lead you to believe from reading his name there that he had something to do with this job?

A. I knew that he was a consultant on the job.

Q. And that he was on the job at least as early as March 30, 1933, when the plans and specifications were adopted?

(Testimony of Stephen Davidson Bechtel.)

A. By "on the job" you mean connected with it?

Q. With the District. A. Yes.

Q. Now, then, is it not a fact that at this conversation Mr. Boggs, in reply to your request or statement that you desired to apply for an extension of time, Mr. Boggs stated to you that it was not apparent at that time that the Six Companies would require an extension of time and that before any extension of time could be granted it would have to be approved by the P.W.A. and the Board of Directors of the District, that in order to get such approval the Six Companies would have to have a good and substantial reason, and that he, Mr. Boggs, knew no reason for an extension and would not recommend it?

A. No, that is not correct. Mr. Boggs did say that he did not favor the extension of time at that time, because he did not know in substance, he did not know what period would be required.

Q. Isn't it true that at the time Mr. Boggs suggested that you defer your request for an extension of time until a short time before the completion date under the contract and that if it was then evident that Six Companies could not finish within the contract time——

A. He said he did not favor our making an application at that time.

Q. Will you please listen to this question and say whether this is a fact. I would like to have an answer. A. I have answered you.

(Testimony of Stephen Davidson Bechtel.)

Q. I think not.

Mr. Marrin: I submit the witness has answered it fair and [1227] square, right on the nose.

Mr. Tinning: I am going to ask it again. Is it not true at this time and place Mr. Boggs suggested that Six Companies defer any request for an extension of time until a short time before the completion date established by the contract, if it was then evident that Six Companies could not finish within the contract time?

A. No, not as you state it. He said that he did not favor our making application for an extension of time then.

Q. Isn't it true that in reply to Mr. Boggs' statement to you that you said to him that you felt it was necessary to put in the request at that time as a matter of record, and that you were going to do so? A. Yes.

Q. Isn't it a fact that at this conversation regarding the extension of time that nothing was said or claimed by you with respect to any condition or conditions on the job that were beyond your control? A. No.

Q. Isn't it a fact that at the time of this conversation you stated nothing whatsoever about ground conditions being different than had been anticipated?

A. No; on the contrary, I stated that they were different than anticipated.

(Testimony of Stephen Davidson Bechtel.)

Q. What did you say at that time and place regarding any condition or conditions that you claimed were beyond your control, everything you said that you can remember?

A. To the best of my recollection I said in substance that the conditions on the job that had developed that were beyond our control substantially were as follows, that the ground conditions were far different from what had been anticipated, the weather for that period had been abnormally bad, and that we were having difficulty under the regulations of the contract, the restrictions in the contract, in getting an adequate supply of experienced men. That was in substance the point which I discussed, and that was with reference to all of the points that I [1228] discussed.

Q. Was that the first time that you ever communicated to Mr. Boggs the fact that the ground conditions were worse than you anticipated?

A. I believe it was.

Q. You have, as I understand, no notes or dates in your records to show when this conversation you referred to with Mr. Boggs occurred? After the notice or request for extension of time had been filed with the District, you remember you testified and said that the conversation occurred when you and your brother, Kenneth Bechtel, encountered Mr. Boggs somewhere on the job near the west portal, and it was a few days following the presenting

(Testimony of Stephen Davidson Bechtel.)

of your request for an extension on June 10, 1935. Is it not a fact that at this conversation that it was Mr. Kenneth Bechtel who asked Mr. Boggs if he, Boggs, had received the Six Companies' application for an extension of time? A. I don't recall.

Q. Isn't it true that Mr. Boggs at that time replied to them it was embarrassing to him because you had been asking for extensions and "I did not like to have to turn you down, but I know of no reason on which I could recommend an extension of time?"

A. I do not recall any such comment as that. I do recall that he said that it was embarrassing, and I also recall that he was disturbed over the matter.

Q. Do you remember another conversation with Mr. Boggs in June of 1935, near the east portal of the tunnel, at which were present yourself, Mr. T. M. Price, the project manager, Resident Engineer Gelston and District Engineer Boggs—the conversation occurring, as I understand it, near the east portal of the tunnel?

A. I do not recall at this time.

Q. Do you recall at that time and place this conversation occurred on June 20, 1935, at which time you stated that the district inspectors were too severe in their inspections and insistence that the work [1229] be done in accordance with the specifications?

A. No, I do not recall that, but it is quite possi-

(Testimony of Stephen Davidson Bechtel.)

ble that I said something to that effect. I doubt whether I said it in those words. I might have said that the district inspectors were abnormally severe and were going beyond common practice of construction, and beyond what was necessary to get the type of structure that was required in the specifications and contract, and for the work that was involved.

Q. And at the time, June 20, 1935, no concrete lining had been placed after December 5, 1935, so that the matters to which you were referring were inspection of outside work?

A. It might have been both; if it was said, and I do not say that it was said, but if it were said it undoubtedly came, my state of mind came from having observed the inspection which was being applied to both concrete structures and other portions of the work, in other parts of the job.

Q. In other words, the subcontractors as well as the contractor were required to build the work in accordance with the plans and specifications?

A. The subcontractors, as well as our own men, felt that they were being required to do an abnormal exactness of requirements.

Q. At this time, in referring to your statement with respect to the severity of the inspectors did Mr. Price state to Mr. Boggs and Mr. Gelston in your presence that Six Companies was ready and willing to furnish any amount of concrete and reinforcing steel necessary, the District to pay for the reinforcing steel, if the District would cooperate

(Testimony of Stephen Davidson Bechtel.)

and permit Six Companies to let the timbers intrude into the concrete lining section where the concrete was unplaced?

A. I don't recall that statement, but it is possible he made it.

Q. And then, following that request of Mr. Price to Mr. Boggs, did you hear Mr. Boggs tell him, Mr. Price, in your presence, that he would not permit Six Companies to place the concrete in if [1230] the timbers extended into the neat section?

A. I don't recall that, but on that point I would like to clarify, if I may, something that I said here yesterday, in which I possibly misstated or misinterpreted something. The question of the intrusion of the timbers, or the moving of the timbers was under discussion, and I think I told you that I did not know—the subject had come up without any previous thought on my part, without my knowledge you were going to bring it up, and my discussions were impromptu, I think I said I believed Mr. Price and Mr. Boggs had discussed the intruding of timbers, and that Mr. Boggs had first permitted one-quarter of an inch, and then half an inch, and then an inch. That was at that time my best recollection, or at least my understanding of it. However, subsequent to that I have gone to Mr. Price and checked the correctness of that, and I wish now to say that I was in error; I was under that impression, but I am advised by Mr. Price that was not the case, and I wish to withdraw that and clarify that.

Q. And that you were not authorized at any

(Testimony of Stephen Davidson Bechtel.)

time by Mr. Boggs to permit the intrusion of timbers into the concrete section?

A. That is correct.

Q. Following that conversation, the statement between Mr. Price and Mr. Boggs, do you remember that at that conversation you told Mr. Boggs that you had complained to him regarding the insistence, the rigorous insistence on following the plans and specifications on behalf of the subcontractors, and now that you had said it and had his reply, that you wanted him to know that Six Companies was going to insist as it proceeded with the concreting of the tunnel that the district inspectors be more cooperative?

A. I do not remember the discussion you are referring to, and who was present, if there was one, but it is quite possible I would say that, because I felt that very sincerely.

Q. Isn't it true at that time and place that Mr. Boggs told you [1231] that the inspectors were required to see that the work was done in accordance with the specifications and that they would continue to see that the work was done in substantial compliance with the terms of the contract and specifications?

A. I don't recall his saying that, but he may have, because that was the procedure which he generally followed.

Q. And that the contractor would not be permitted to install the concrete lining with the timbers intruding into the section?

(Testimony of Stephen Davidson Bechtel.)

A. I don't recall that.

Q. You would not say that did not occur?

A. No, I have no recollection of it.

Q. You testified that sometime in November of 1935 at a conversation with Mr. Boggs, I think you said Mr. Hindmarsh was present. Do you remember that meeting? A. Yes.

Q. Are you able to fix the date on that, Mr. Bechtel?

A. I believe it was November 19, and the reason I say that is because the next day I dropped a memorandum to Mr. Hindmarsh to get his construction schedule, and that had been discussed.

Q. That is the only way you have of fixing that date? A. Yes.

Q. Where did that conversation occur?

A. In the office of Mr. Hindmarsh and Mr. Price, in Six Companies' job office, and more particularly in the room that Mr. Hindmarsh and Mr. Price were occupying.

Q. And present at that meeting were Mr. Hindmarsh, yourself, Mr. Delancey Smith, and Mr. Boggs? A. Yes.

Q. Isn't it a fact that when Mr. Boggs came to the meeting that Mr. Smith asked him what had happened in regard to the 48-hour week authorization? A. I have no such recollection.

Q. Isn't it a fact that in reply to that inquiry Mr. Boggs stated to him that he, Mr. Boggs, had notified Mr. Price by telephone immediately on receipt of the authorization from Mr. Sweetser,

(Testimony of Stephen Davidson Bechtel.)

[1232] that he sent him a copy of Sweetser's letter at once?

A. He may have said that, I have no recollection of it. However, I do recall that at some time Mr. Boggs did phone Mr. Price—this is hearsay, but I understood from Mr. Price that Mr. Boggs had phoned him that we could proceed with the 40-hour per week, and that he would confirm it in due time, not 48.

Q. Let us get this straight. After the accident in 1935 you applied to the Board of Directors of the District on the 5th day of October, 1935, and made formal application for a 48-hour week in accordance with the recommendation of the Industrial Accident Commission of this State?

A. You may be correct.

Q. Evidence went in yesterday to show that you were authorized to work and you commenced working your crews 48 hours a week on the 13th day of October, 1935; that is true, is it not?

A. That we started work in October?

Q. On the 48-hour week.

A. I don't recall the date.

Q. And a letter went in here yesterday from Mr. Sweetser dated October 12, 1935, authorizing the 48-hour week.

A. I would not deny that. It is probably correct.

The Court: We will take a recess now until two o'clock.

(A recess was here taken until two o'clock p. m.)

[1233]

(Testimony of Stephen Davidson Bechtel.)

Afternoon Session

STEPHEN DAVIDSON BECHTEL,

Cross Examination (continued)

Mr. Tinning: Q. Mr. Bechtel, we were discussing the conversation which you say occurred on November 19, 1935, at the noon adjournment. You stated you fixed the date of that meeting by the fact on the following day—you refreshed your recollection by the fact that on the following day you sent Mr. Hindmarsh some kind of a notice or instruction to proceed with the preparation of some paper. What document was it that you instructed Mr. Hindmarsh to prepare?

A. A revised construction schedule.

Q. In that discussion, was it true that there was some talk respecting operating, or authority to operate, with 48 hour week men on reopening of the drift excavation in the upgrade tunnel?

A. I don't recollect it.

Q. You do not recall it. As a matter of fact, at this time,—November 19, 1935,—you had practically completed the recovery of the tunnel from the slides and placing the concrete, and were at that time preparing to proceed with the further driving of the tunnel? A. That is right.

Q. So far as you are able to recollect, there was no discussion as to the time or how long the men should work who were to work on the driving of the

(Testimony of Stephen Davidson Bechtel.)

tunnels henceforth when you resumed that work; you don't recollect that?

A. I don't recollect that.

Q. At that time, you asked Mr. Boggs something about the extension of time, and stated it appeared necessary that you apply for an extension of time; is that correct?

A. I don't recall it coming up in that way.

Q. At that time and in your presence, did you hear Mr. Delancey Smith state to Mr. Boggs that, during the last spring,—that would be the spring of 1935,—that Mr. Boggs stated the application for an [1234] extension of time was premature?

A. I don't recall that.

Q. Do you recall Mr. Delancey Smith said that Mr. Boggs had said at that time,—referring to the spring of 1935,—that an extension might not be necessary? A. I do not recall that.

Q. Do you recall that Mr. Smith then asked Mr. Boggs if he, Mr. Boggs, still was of the same opinion? A. I don't recall that.

Q. And then do you remember that Mr. Boggs stated in that conversation, to the persons present, that he still considered that an application for an extension of time on this date, November 19, 1935, would be premature; and, further, that, if you did make such an application, it must be approved by the PWA?

A. No; I have no such recollection.

(Testimony of Stephen Davidson Bechtel.)

Q. Do you recollect then Mr. Smith stated to Mr. Boggs that Mr. Boggs' recommendation would probably be followed by the PWA, and Mr. Smith stated to Mr. Boggs that, in view of an erroneous geology, unforeseen difficulties encountered by the Contractor, that the request might reasonably be granted? Do you recall Mr. Smith saying that to Mr. Boggs? A. No.

Q. And thereafter Mr. Boggs replied that such matters had already been discussed and acted upon, and that his recommendation was still no; do you recall that?

A. Not in any way at all. I do not believe that took place; but I have no recollection as to it.

Q. What do you think took place?

A. Well, I told you the other day.

Q. Will you tell us again?

A. Yes. This discussion was started as a general one, and developed into a discussion of the future construction schedule, as a matter of preparing the future construction schedule; and Hindmarsh was to make a future construction schedule up, which he said would take until about the first of the [1235] year to be able to, with reasonable accuracy, forecast the future schedule; and Boggs said that that would be fine—words to that effect; that when that was ready he would be glad to go over it with Mr. Hindmarsh and agree with him as to the correctness or reasonableness of the construction schedule; and would also review an application for extension of

(Testimony of Stephen Davidson Bechtel.)

time as to the time, the period of the extension of time that Mr. Hindmarsh would apply for, or the Company would apply for.

Q. Is that all of the conversation?

A. No; that the District's objections to our application up to then were not necessarily a question of our right to the extension, but they did not want to confuse the more major points that were of controversy, by discussing major controversies which existed between the District and ourselves.

Q. Was that the substance of the conversation?

A. The substance; that was the substance of the conversation.

Q. You took notes of that conversation?

A. No.

Q. Were any notes taken of that conversation?

A. I cannot answer that.

Q. What was Mr. Delancey Smith doing there?

A. Delancey Smith had been there; was advising us very closely; spent a great deal of time with me, in helping me; and I was relying upon him, and working with him for some months prior to that.

Q. What was he doing there on the occasion of the 19th of November, 1935?

A. Well, I have no recollection as to the particular purpose of it, Mr. Tinning.

Q. Pardon me.

A. It is not important. I was going to observe that, from time to time, he and I drove to the

(Testimony of Stephen Davidson Bechtel.)

ground. I would drive by his home and pick him up in the morning, and we would go out over the job, and then go on to San Francisco together. [1236]

Q. At that time and place, after Mr. Boggs had made his statement with respect to his recommendations for an extension, did you hear Mr. Smith say to Mr. Boggs that he realized that his recommendation,—Mr. Bogg's recommendation—that no extension be given, was Mr. Bogg's technical position; but that it might be possible to change that decision? Did you hear that?

A. I have no recollection.

Q. Would you say it was not said?

A. No; I have no recollection of that coming up at all. I am of the opinion it was not said; but it may have been.

Q. Do you recall, in that conversation, that Mr. Boggs said, in substance and effect, that he had considered the matter from all possible viewpoints, and, as he knew of no valid reason for an extension of time that had been suggested, the answer to the request would still be "No"?

A. No; I don't think he said that.

Q. Following that, did you then suggest to Mr. Boggs that he co-operate with you,—Six Companies,—and think up some good reason for an extension of time?

A. No; I have no recollection of that. I do recall that Mr. Boggs said that the application for exten-

(Testimony of Stephen Davidson Bechtel.)

sion of time should be on uncontroversial grounds, if possible.

Q. Do you remember Mr. Boggs saying to you, following your suggestion with respect to the reasons for an extension, that he thought there were brains enough in the Six Companies organization to prepare their own extension of time without his help?

A. No. That was not the spirit which Mr. Boggs discussed—or the spirit in which we were discussing it with him.

Q. Was it said by him?

A. I do not think it was said.

Q. Did Mr. Boggs ever suggest a new schedule of operations was in order, and that he would probably write and request a new schedule of progress?

A. Not just as you say it; I believe Mr. Boggs suggested or asked that we prepare a new construction schedule. [1237]

Q. Then did you state to him that you would prepare one and file one about January 1st?

A. I did not say that. I think that Hindmarsh, with whom he was discussing the matter of the future operations, said he would prepare it and have it ready about that time.

Q. And that you would accompany the schedule with a request for an extension of time; did you say that?

A. No. I don't remember any such discussion on any such points as that. There was a discussion,

(Testimony of Stephen Davidson Bechtel.)

as I recall it—it was between Mr. Boggs and Mr. Hindmarsh—that, at some time after the revised construction schedule was prepared and while they were considering the revised construction schedule, they would also prepare or go over together a draft of an application for extension of time, so it would be in form; and Mr. Boggs could recommend and approve it—recommend an approval that would go forward with his recommendation and approval.

Q. Then did you state to Mr. Boggs, following the discussion of the schedule and the proposed additional request for an extension of time, that you expected to start the drift work on the upgrade,—that would be the south tunnel,—in the next few days, to connect with the east portal drift?

A. I have no such recollection.

Q. Would you say you did not say that?

A. I don't think I said it. I won't say I did not say it; but I don't think I would say it, for the reason the matter of construction details and construction procedure had been carried on primarily between Mr. Boggs and Mr. Hindmarsh.

Q. Then did you state that, following the commencement of the work in the south tunnel, you would propose to take up the removal of the debris in the north tunnel that remained there, and then start driving your rings in both tunnels?

A. I don't recall that.

Q. Did you, in that conversation, advise Mr. Boggs that Mr. Hindmarsh was in charge of the

(Testimony of Stephen Davidson Bechtel.)

tunnel work, and to address all communications [1238] on the tunnel work to him?

A. I don't recall that.

Q. That Mr. Price was still project manager, but would be absent from the work from time to time? A. I don't recall that.

Q. Do you recall that Mr. Boggs then requested you to write him a letter authorizing any change in the manner in which communications were to be addressed by him, as District Engineer, from the District to the employees of the Six Companies?

A. I don't recall that. He may have such a letter, but I don't recall it.

Q. You did write such a letter the next day, didn't you?

A. I don't recall whether I did or not. It is probably in these numerous letters that have been introduced here.

Q. But you do not have any recollection?

A. I don't recall it at this moment; no.

Q. Although you recollect the conference, or the conversation, with Mr. Boggs on November 19th, by the fact on the day following you wrote a memorandum to Mr. Hindmarsh with respect to a schedule? A. That is right.

Q. Following this, there was some discussion, about details of construction, between Mr. Boggs and Mr. Hindmarsh, in which Mr. Boggs asked Mr. Hindmarsh to take up with Mr. Gelston, the District Resident Engineer—Do you remember that?

A. No.

Q. Do you remember that, following this, Mr. Boggs drove you and Mr. Smith to 40th and Broadway?

A. I don't recall that. He may have; but I don't recall it.

Q. Do you remember, as you drove in, in the car, that Mr. Boggs asked you what status Mr. O. W. Peterson, who was one of your consulting engineers who had been acting in the recovery work in the tunnel, would continue to have with Six Companies?

A. I don't recall, at this time; but I am just thinking here, now, at some time a discussion something to that effect took place. [1239]

Q. But you have no distinct recollection whether it was on the 19th of November or at some other time? A. No.

Q. You have no distinct recollection of whether Mr. Boggs took you in from the work to 40th and Broadway where you took the Key Route train to San Francisco? A. No.

Q. With Mr. Smith? A. No.

Mr. Tinning: No further cross-examination.

Redirect Examination

Mr. Marrin: Q. Mr. Bechtel, where were the west portal buildings located, with reference to the portals of the tunnel?

A. They were located in a deep cut immediately adjacent to the west portal of the tunnels.

Q. Was there any necessity for getting those buildings constructed prior to the commencement of the construction on the tunnels?

(Testimony of Stephen Davidson Bechtel.)

A. Yes; the portal buildings were, in fact, the portals of the tunnel; and it was necessary to have them in shape to hold the portals of the tunnel as early as possible, particularly in view of the fact that the slopes on either side of this deep cut had slid, and there were additional slides, particularly as winter came on, and it was necessary to make every effort possible to rush the portal buildings and to backfill the portal building structures, in order to stop any possible cave-in of the slopes or sides of the deep cut, and also to stop the possibility of sloughing or sliding of the portion of the cut immediately over the top of the tunnels themselves; that was a hazardous situation, and it was recognized, and we did everything possible to rush those tunnels.

Q. The buildings, you mean?

A. The buildings.

Q. Could access be gained to the west portal of the tunnel until those buildings were partially constructed?

A. No; the placing of the building and the crossmembers were directly in front of [1240] and had to be gone through or over, in approaching the drifts to the tunnels proper; and it was necessary to have those portions out of the way so we could have access to that other part.

Q. It did not make any difference whether that was done by the Six Companies or not, or a subcontractor?

(Testimony of Stephen Davidson Bechtel.)

A. It did not make a bit of difference; it is one of the construction problems of the portal buildings,—the construction itself; and whether it was done by subcontractors or Six Companies of California or anybody else it did not make a bit of difference; the work was carried on as a necessary part of the construction itself, in order to gain access to the tunnels and to carry the project, as a whole, forward as fast as possible.

Q. On your cross-examination, reference was made to the fact that the work on the west portal was shut down from August 3rd to August 23rd, and also that the west portal buildings were subcontracted. Did the fact that any buildings were subcontracted cause the shutdown?

A. It affected the shutdown in no way at all. The work was carried on by the subcontractors in anticipation of the tunnel approaches and for the portal buildings, and was carried on just as if it was done by our own operations.

Q. The shutdown was due to the nature of the ground? A. Yes.

Q. Mr. Bechtel, I show you Defendant's Exhibit "T",—which is a letter dated October 18, 1934, signed by Six Companies of California, apparently by yourself as president, addressed to the Honorable T. A. Reardon. You have seen that; it was read during your cross-examination? A. Yes.

Q. At the date of that letter, Mr. Bechtel, how

(Testimony of Stephen Davidson Bechtel.)

far had the excavation proceeded in the bottom drift on the west portal of the tunnel?

A. The bottom drift of the south tunnel had been driven—both of them had been driven in to their full depth of approximately 92 feet, and had been driven all that distance through very heavy and [1241] very bad ground; and, when we stopped, or ended those drifts, they were still in this very heavy ground.

Q. How about the north tunnel?

A. The north tunnel bottom drifts had been driven in their full distance, and these bottom drifts were driven approximately 110 feet, and also ended in soft, bad, heavy ground.

Q. So, at the date of this letter, you knew the nature of the ground which had been encountered in the 92 feet in the south tunnel and the 110 feet in the north tunnel?

A. I not only knew that, but it appeared we did not know how far or how much additional bad ground we would have; but we knew we had had bad ground in both those tunnels up to that time, through the entire length of the work on both tunnels.

Q. You testified, on your cross-examination, that, at the time excavation was stopped in the tunnels on August 21, 1935, there were approximately 900 to 1000 feet in each tunnel standing open under timber. How long had these portions of the tunnels been standing open under timber at that time?

(Testimony of Stephen Davidson Bechtel.)

A. Well, if I recollect, the question was to effect that the portion of the tunnel driven in January had been open some six months, and the portion driven in December had been standing some seven months; but that does not give the true reflection,—the true situation,—because they were standing a length of time dependent upon their position in the tunnel; those farthest from the portal had only been up a few days, and the majority of them had only been placed—the average length of time was probably less than three months; in other words, the average of the timber in the tunnels had probably been standing—were standing probably on an average of less than three months.

Q. In other words, as the tunnels were excavated, from about December up to August 21st; is that correct—— A. Yes.

Q. And they were timbered as they were excavated? A. Yes. [1242] Immediately after.

Q. And the timbering toward the face of the tunnel had only been in a short time?

A. Well, a few days up to the time of—— Probably an average of less than three months.

Q. Mr. Bechtel, I refer you to Plaintiff's Exhibit No. 47,—a letter addressed by Six Companies of California, by yourself as president, to the board of directors of Joint Highway District No. 13——

Mr. Wittschen: Give the date, please, Mr. Marrin.

Mr. Marrin: Q. —dated July 26, 1935. I will

simply read the last paragraph. The letter has been read in evidence before—I think it has all been read in evidence, and I simply want to draw your attention to the last paragraph:

"Within the past three months, Mr. Boggs, your chief engineer, has advised the writer of this letter that the delay in the progress of the work was beyond the control of the contractor and was in no manner our fault, and has stated we have a proper ground to request an extension of time, but that he would not approve such an application at this time because it might later develop that the extension of time would be unnecessary. He has made substantially the same statement to Mr. T. M. Price within the last sixty days and has likewise made substantially similar statements to Mr. DeLancey Smith. Under the circumstances, the grounds assigned in your letter of June 4th for denying the application are not in accord with the facts or with the opinion of your engineer, and therefore should be withdrawn, even though action on the application for an extension is deferred at this time.

"We, therefore, write this letter to protest against the denial of the extension for the reasons given in your letter, and to reaffirm the application made by our letter of June 10th and our right to an extension." [1243]

Did you ever receive a reply to that letter?

A. To the best of my knowledge, we never did.

(Testimony of Stephen Davidson Bechtel.)

However, Mr. Marrin, is it not correct that that refers to a letter there on June 4th?

Mr. Marrin: I think there was a mistake in your copying?

Mr. Tinning: No; there is no mistake.

Mr. Marrin: There may be a mistake in the original letter.

Mr. Tinning: I think what you refer—what you were referring to was a letter—— There was a mistake in the original letter, and we checked that.

Mr. Marrin: Yes.

Q. Well, I asked you whether you had received a reply to that letter, and you stated to the best of your recollection you had not?

A. That is correct; to the best of my recollection, I did not.

Mr. Marrin: No further questions.

Recross Examination

Mr. Tinning: Q. Mr. Bechtel, when you said the average length of time the timbers had stood in the tunnels, after installation and before concreting, was three months, you are taking the entire stretch of the tunnels excavated and standing with timber, taking an average of the whole, approximately 2000 feet or 1800 feet,—whatever the distance was?

A. I am expressing an approximation.

Q. Some of the timbers just above the excavated face where you were setting out the timbers had been placed that day?

A. That is correct.

(Testimony of Stephen Davidson Bechtel.)

Q. And some of them had been placed, furthest toward the west, had been placed there at the time the tunnel was excavated in either December or January? A. Yes.

Q. And what took place at Station 114 in the north tunnel before the slide occurred on the 28th of August was that your employees were [1244] resetting timbers where you had excavated on the 20th of February? A. I don't recall the date.

Q. If that was the date, that would be approximately 6 months before the letter of August 23rd?

A. Yes, if the dates you speak of are correct, that would make approximately 6 months.

Q. You have not looked up, since you testified, to check up on it?

A. I have never looked it up.

Q. With respect to your testimony regarding Plaintiff's Exhibit No. 47, in which you said that Mr. Boggs had told you and other people that he would grant you an extension of time, on the same day you wrote a letter dated July 26, 1935, in which you stated that if you did not have a reply—Plaintiff's Exhibit No. 57 is the letter that I am referring to—You will remember, Mr. Bechtel—I don't propose to try to confuse you; I am trying to get something cleared— You wrote two letters on July 26th to the Board of Directors,—one of them is your Plaintiff's Exhibit No. 47, which was with respect to the extension of time; and the other was your letter of same date, Plaintiff's Exhibit No. 57, in which you delivered an ultimatum to the District

(Testimony of Stephen Davidson Bechtel.)

if they did not agree to arbitration and answer you by the 7th of August, that you were going to cease work; and we did not answer either letter, did we?

Mr. Marrin: Mr. Tinning, that was arbitration merely on the lines and grades, wasn't it?

Mr. Tinning: Yes; but we had an ultimatum. I will read you——

A. I think you are referring to a separate letter.

Q. Of the same date?

A. Yes; that may be correct.

Q. Written by you on the same day; which states, in the last paragraph—or the last two paragraphs, reading from page 3, Exhibit 57:

> "In the event that you are unwilling to submit the matter to arbitration, we will expect to immediately commence such legal proceedings as may be necessary or proper to determine our rights in the matter. [1245]
>
> "In order that a speedy settlement may be reached, we ask that you reply to this letter by August 7, 1935. If we do not receive an affirmative answer by that time, we will consider that you do not care to arbitrate the matter and commence such legal proceedings as may be proper, as above suggested."

You did not commence any legal proceedings?

A. No; to the best of my knowledge, we did not. However, we did start, or continue, our endeavor to negotiate with Boggs, trying to work this out on an

(Testimony of Stephen Davidson Bechtel.)

amicable, reasonable, practical basis; and we continued, after that, up to May, 1936.

Q. Is it your conclusion, then, from the correspondence, that you have heard read while you have been sitting here, that you continued in an amicable manner to try to work this matter out?

A. We continued for a long, long time; and we continued through 1934; we continued through 1935; and we continued until 1936, up to the time we were driven from the job.

Q. You were driven from the job at 10:45 p. m. —let me finish—— When you were driven from the job at 10:45 p. m., on Saturday night, June 13th, when you telephoned you were quitting work?

A. No; that was not the date we were driven from the job. We were driven from the job when you people broke faith and when you started extracting penalties from monies that were reasonably due us.

Q. And you negotiated right up to June 13, 1936?

A. I do not think I refer to June, Mr. Tinning. I think I referred up to May.

Q. You were not driven from the job until the 13th of June, 1936?

A. Well, you may be right about the date, Mr. Tinning.

Q. We will now go back to the subject we were discussing,—the letters of July 26, 1935. You had no reply?

A. That is as I understand it. [1246]

Q. And you continued to work? A. Yes.

Mr. Tinning: Thank you. That is all.

Upon Appeal from the District Court of the United States for the Northern District of California, Southern Division.

PARKER PRINTING COMPANY, 545 SANSOME STREET, SAN FRANCISCO

THOMAS MOORE PRICE,

called for the plaintiff; sworn.

Direct Examination

Mr. Marrin: Q. What is your occupation, Mr. Price?

A. I am a civil engineer, by training; but I have always been working with contractors as a superintendent.

Q. Will you state what your education and experience in the contracting business is?

A. I finished college; I graduated in 1912 from the University of North Carolina, getting a literary degree. I taught school for a year in order to pay my tuition; and then I went back to college and took a degree in civil engineering, finishing in 1915. I worked for a contracting firm named Robert G. Lassiter and Company, principally in North Carolina, but on the East Coast for approximately 3½ years. This firm was engaged in general contracting, building of cantonments during the time of the War, and other general contracting work,—no large job; not much larger than a million dollars. At the beginning of 1919, I came West, and—to Seattle, and secured a job with the Kaiser Paving Company in Seattle,—a job as a material clerk; and a few months after that, I was made a superintendent of their work—various jobs, from time to time; I stayed with that company until 1931, in general contract work on the Pacific Coast, largely paving, aggregate production for paving, some earth dams, some

(Testimony of Thomas Moore Price.)

industrial plants. In 1931, I was loaned by Mr. Kaiser to the Six Companies, Incorporated, and I went to Boulder Dam for 4 years; at Boulder Dam, I was in direct charge of the aggregate production and the railroad operations, consisting of moving the aggregate and moving the muck on the job from the dam excavation and from the tunnel out to the disposal point. [1247] This work, during the 4 years I was there, cost approximately ten million dollars.

On September 20th—on or about September 20, 1934, I was ordered to report to the Six Companies of California on the Broadway Tunnel project in Oakland.

Q. What was your position with Six Companies of California?

A. I was called "project manager."

Q. What were the duties of that position?

A. The duties of the position were to handle the business end of the job.

Q. How long did you remain in that position?

A. Why, I am still in it, so far as I know. I stayed with the job until we rescinded the job in June, 1936. Since that date, I was occupied for the first year in looking after the Six Companies of California equipment and tools and other interests on the job; and, since that time, I have been largely engaged in making preparations for this litigation.

Q. After you were employed by Six Companies of California, in September—on September 20, 1934, were you at the site of work daily?

(Testimony of Thomas Moore Price.)

A. Yes, I was, practically every day, during the entire time. I may have been absent two or three days during the period from September, 1934, to approximately a year later. I was not absent over three or four days—I don't think.

Q. Were you frequently in the tunnels while they were being excavated? A. Yes, I was.

Q. You were familiar with the work that was going on in the tunnels?

A. Yes, I thought I was quite familiar with it.

Q. During all the time from September, 1934, up until June 13, 1936?

A. I was quite familiar with the work until the fall of 1935, because I spent approximately 12 to 14 hours per day on the job. After September, 1935, I did not spend as much time on the job. I tried to get out once a day, but some days I was out of town; I was out of town some portion of the time between that time and June, 1936; [1248] but I was fairly familiar with the work most of the time.

Q. What was the status of the work at the time you were employed by Six Companies of California on September 20, 1934?

A. Do you mean the tunnel work or all the work?

Q. Yes, the tunnel work.

A. When I arrived at the job, I found the west portal approach and building excavations largely completed; the west portal ventilating building was constructed approximately up to the first story.—I would say, 35 or 40 feet high; the bottom drifts had been driven quite a way into the hill; some of the

(Testimony of Thomas Moore Price.)

other drifts above had been started; some of the circumferential drifts above the bottom drifts, and the plant in general pretty well along; the concrete plant; the bunkers were practically built; the unloading point for the aggregates was generally constructed, with the exception of some details; the timber plant was in shape, and functioning; the blacksmith shop and the compressor shop, and so forth, were all constructed.

At the east portal, very little work had been done, with the exception of some excavating for the portal buildings—not a great deal.

Q. Well, the tunnel work had been started at that time?

A. The drifts had been started at the west portal.

Mr. Marrin: May I have Exhibits "DD", "EE", "FF", "GG"?

Q. Mr. Price, I refer you to Defendant's Exhibits "DD", "EE", "FF", and "GG," which are an exchange of correspondence between you and Mr. Boggs, commencing on January 9, 1935, and running through to January 24, 1935, with reference to the shutting down of work on the outside buildings. I think you were in court yesterday, when you heard those letters read? A. Yes, I was.

Q. Exhibit "DD," the letter of January 9, 1935, states, in part:

> "In confirmation of our conversation of January 5th with respect to the postponement of work on certain structures you are [1249] advised as follows:——"

(Testimony of Thomas Moore Price.)

Then, that refers to a conversation which you had with Mr. Boggs? A. Yes.

Q. That was held on January 5, 1935?

A. I presume it was; I have no memory of the date, other than the letter.

Q. Were you and Mr. Boggs the only ones present at the conversation?

A. I don't recall. I recall talking to Mr. Boggs.

Q. Do you recall what was said at the time?

A. Mr. Boggs said he would desire us to stop the work on the structures,—the outside structures, principally, as I recall it, the Golden Gate Bridge excavation, the Landvale Viaduct excavation and the upper walls at the west portal building, because of weather conditions.

Q. In your letter of January 18, 1935, to Mr. Boggs,—which is Defendant's Exhibit "EE"——

The Court: Pardon me. What letter is this?

Mr. Marrin: January 9, 1935.

The Court: What is the substance of that letter, so I may refresh my memory on it?

Mr. Marrin: Would you like me to read the letter, your Honor?

The Court: Yes.

Mr. Marrin: This is a letter dated January 9, 1935:

(Testimony of Thomas Moore Price.)

"File: Broadway Tunnel Schedule
"Six Companies of California,
Field Office, Post Office Box 120,
Berkeley, California.

Attention of Mr. T. M. Price, Project Manager.

"Dear Sir:

"In confirmation of our conversation of January 5 with respect to postponement of work on certain structures, you are advised as follows:

"Conditions are unfavorable for work on the Golden Gate Overhead Structure due to the fact that the footing excavations which were opened up more than a month ago have been damaged by exposure to heavy rainfall. It will not be feasible to proceed with the [1250] completion of these footings until the rainy season is over and the damage can be satisfactorily repaired.

"It is not advisable to start footing excavations on the Landvale Overhead and Viaduct structures until the rainy season is over. Conditions similar to those now existing on the Golden Gate Overhead Structure will undoubtedly result if these excavations were made and exposed to the rainy weather which may reasonably be anticipated.

"The right-hand Service Road walls at the West Portal southerly from the South buttress of the Portal Buildings cannot be constructed until the fills which have been necessary on ac-

(Testimony of Thomas Moore Price.)

count of excessive excavation shall have been thoroughly consolidated and no longer subject to settlement.

"Reference is made to Section 6, Subsection (r) 'Temporary Suspension of Work' of the specifications, and you are directed that work on the above structures shall not proceed until conditions are considered favorable by the District Engineer. Such postponement shall not constitute a basis for any extension of time for the completion of the contract.

"It is noted that the schedule submitted by you in August, 1934, contemplated the completion of these units by December 1, 1934; if such progress had been made, the conditions now existing with respect to the Golden Gate and Landvale structures could probably have been avoided.

"Very truly yours,
"(Signed) WALLACE B. BOGGS,
District Engineer."

Mr. Marrin: Q. Then, on January 18, 1935, his reply letter to Mr. Boggs, which reads as follows:

"Mr. Wallace B. Boggs, District Engineer,
Joint Highway District No. 13,
1448 Webster Street,
Oakland, California. [1251]

"Dear Sir:

"We wish to acknowledge your letter of January 9th, directing us to suspend operations on

(Testimony of Thomas Moore Price.)

certain structures until conditions are considered favorable by the District Engineer.

"This is entirely satisfactory with us. However, we note that you state that such postponement shall not constitute a basis for any extension of time for the completion of the contract. We would like to ask your reconsideration of this, in accordance with Paragraph C, Section 4 of the Specifications, wherein it is stated that if stormy or inclement weather unavoidably delays the work such time shall be added to the aforesaid time for completion.

"We are not certain that we will need such an extension. However, the grading of the road is being held up subject to completion of the structures and if the grading is delayed in the summer of 1935 to a date that will make it impractical to lay the oil surfacing, it might be advisable to postpone such surfacing until the spring of 1936.

"Under such a condition, we believe that a request for extension of time on this account would be in order.

"Yours very truly,

"SIX COMPANIES OF CALIFORNIA,

"By (Signed) T. M. PRICE,

Project Manager."

Q. Referring to the last statement there in that letter,—that it will be impractical to lay the oil sur-

(Testimony of Thomas Moore Price.)

facing, and if the grading is delayed in the summer of 1935 to a point that will make it impractical to lay the oil surfacing, it might be advisable to postpone such surfacing until the spring of 1936,—will you state why it might be advisable to postpone this surfacing, or the laying of the paving, if it were delayed until the spring of 1936?

A. The fact that [1252] our contract time ended on May 24th was just a short period after the rainy season, and it would be impractical; and the Engineer had stated he did not want paving laid on wet subgrade; in fact, the specifications, I believe, provide for a certain temperature,—a certain minimum temperature during which it could be laid. I did not seriously regard the delay at the present time, but I could foresee a condition where it might be affected if the structure were not complete, if we were not able to start on the job soon enough in the spring of 1935, and finish and get the grade down, where we would be delayed in the spring of 1936; and the letter expresses my thoughts there.

Q. In other words, if the pavement could not be down in the summer of 1935——

A. It would have to be postponed until 1936,—the summer.

Q. After the rainy season?

A. That was my understanding.

Q. Could the fills and cuts be completed before the tunnel was excavated?

A. A portion of the fills could not be completed.

(Testimony of Thomas Moore Price.)

Q. Will you state why?

A. The fills immediately adjacent to the west portal were contemplated and designed to be constructed of the material which was to be excavated from the tunnel.

Q. If that material were not excavated prior to the rainy season of 1935 and 1936, the fills could not be completed until after the rainy season?

A. That is right. Naturally, the fills could not be completed until we got the excavation out of the tunnel; and we were not sure as to the excavation we would get from the tunnel,—whether it would be acceptable or not.

Q. And the paving could not be laid until after the rainy season was over?

A. On that portion, it could not be laid. There was another reason, too, that I thought might interfere; and that was the fact that some of the cuts on the west approach road showed some [1253] indication of sliding, even at that early date. In fact, some of the drifts, some of the fills, had slid, as well as the cuts.

Q. Following that exchange of letters between you and Mr. Boggs, Mr. Price, did you have any further conversation with Mr. Boggs, respecting an extension of time?

A. Yes, I had a conversation—well, I heard a conversation.

Q. You said "Yes." Will you state, according to your best recollection, the first time after that that you had a conversation with Mr. Boggs?

(Testimony of Thomas Moore Price.)

Mr. Wittschen: This only calls for the time.

Mr. Marrin: Yes.

The Witness: A. To the best of my memory, it was about the middle of May, 1935.

Mr. Marrin: Q. Will you state who was present?

A. Mr. S. D. Bechtel and Mr. Boggs and myself.

Q. Will you state what was said at that time?

Mr. Wittschen: Objected to as irrelevant, incompetent and immaterial, and not binding on the District.

Mr. Marrin: This is on the subject, your Honor, which has already been gone into a number of times, and on which we argued the objection before. It goes to show the state of mind of the District Engineer, and to prove, in his judgment, we were entitled to an extension of time, despite the fact the District formally rejected the request.

The Court: As a matter of law, assuming that he was in that state of mind, and assuming that conversation which you develop would indicate he led them to believe that they were going to get an extension of time, just what would that result in?

Mr. Marrin: Well, if your Honor please, if we can show in this case, as a matter of law, that, in the judgment of the District [1254] Engineer, we were entitled to an extension of time, and if the District did not grant the extension of time, then their action was wrongful and in violation of the contract. While engineers and architects are given

(Testimony of Thomas Moore Price.)

rather wide power under these contracts, the cases are quite clear that they must exercise those powers fairly as arbitrators, and act for both parties, and they must not act capriciously or fraudulently or in the interests of one party as against the other, and that they must exercise their own independent judgment, and must not act under the domination or influence of their employer, the owner, or of anyone connected with the owner.

Now, it is our purpose to show here that this District Engineer either did not exercise any judgment in the matter,—and consequently his action is void; or, if he did exercise or make any decision here, he made it absolutely contrary to his own opinion and belief as to the circumstances. Now, we can show, if your Honor please—and we would like to submit authorities on that question, which we have not submitted yet—that, if that situation exists, his denial is of no effect and may be set aside; and that we are then entitled to the judgment of the Court as to whether or not, under the circumstances, we were entitled to the extension of time.

Mr. Wittschen: The cases hold that the opinion of the engineer cannot be set aside for mistake or for anything else except fraud and oppression, or it may be such a gross mistake as would amount to fraud and oppression, for instance, if he utterly misconceived the quantities of material, we will say, that should go into a certain place, to such an extent that it would amount to fraud.

In this case, however, the extensions of time were

(Testimony of Thomas Moore Price.)

not granted by the Engineer. They were granted by the Board of Directors of the District, on proper application. That application was made. The Contractor was advised by the Engineer that he did not think they [1255] were entitled to it. The two other exhibits, which counsel called for but which were not read, will show the witness on the stand said he did not intend that as an application for extension; he was simply making it a matter of record in case he wanted time in the future, and that it referred to the outside work; the tunnel was the main work; and they had plenty of time, after the tunnel was started, to do that outside work, or to do the outside work while the tunnel was being completed; but, as a legal matter, strictly under the specifications, the Engineer had nothing to do with it; it was up to the Board of Directors.

The Court: The Court is prepared to rule. I will give counsel a record.

Mr. Wittschen: Submitted.

The Court: I will allow it subject to a motion to strike and over the objection of counsel.

Mr. Wittschen: Exception.

Mr. Marrin: Q. Will you state what was said at that time, Mr. Price?

A. Mr. Boggs and Mr. Bechtel were talking——

The Court: Q. This was what date?

A. It was approximately the middle of May, your Honor, 1935. I cannot recall the date exactly.

Mr. Wittschen: Wait just a minute. You have these confused, Mr. Marrin. My objection might

(Testimony of Thomas Moore Price.)

not be—there were two other letters that you are omitting. You read the letter here in January, and now you are jumping to May? Do you mean that?

Mr. Marrin: That is right, Mr. Wittschen. I am not claiming these letters here—I am just bringing them up in sequence.

The Court: Then, as I understand it, it was a conversation between the witness on the stand and the Engineer and Mr. Bechtel?

Mr. Wittschen: Yes; subsequent to these letters; but the way counsel phrased the question, I was calling attention to the fact [1256] there were two other letters in between, that he had not brought up on the same subject.

Mr. Marrin: Those were read yesterday. I did not read them today.

Mr. Wittschen: Very well.

Mr. Marrin: Q. Will you answer the question?

A. May I ask that the question be read.

The Court: Read the question, Mr. Reporter.

(Record read.)

The Witness: A. I came upon Mr. Bechtel and Mr. Boggs, discussing the job conditions, on the office steps,—the job office at the west portal,—and listened to the conversation for approximately 15 or 20 minutes, to the best of my recollection. The substance of the conversation, to the best of my recollection, was about the job conditions in general; and, in the discussion, Mr. Bechtel brought up the point of the difficult ground conditions; and I remember particularly I asked Mr. Boggs, myself, if

(Testimony of Thomas Moore Price.)

he did not consider that those different ground conditions warranted an extension of time; he replied that he considered the ground conditions different from those anticipated and that they did warrant an extension of time, but that he would not be in favor of granting an extension of time at this time, but would recommend that we wait until the proper time, in his opinion,—which would be near the end of the job,—and then make application for the extension. He also stated that we did not know, at that time, whether or not we would need any additional extension of time, and how much we would need, if we did need it.

Q. Is that all?

A. That is the substance of the conversation, to the best of my memory.

Q. Well, did you thereafter at any time discuss with Mr. Boggs the [1257] question of an extension of time?

A. Yes. To my best recollection, I talked with him a few moments in the early part of—about the first week in December, 1935, when I saw him at the west portal.

Q. Who was present at the time of that conversation?

A. I do not recall anyone being present; but I may be mistaken in that regard.

Q. Well, other than you and Mr. Boggs?

A. Other than Mr. Boggs and myself.

Q. What was said at that time?

(Testimony of Thomas Moore Price.)

Mr. Wittschen: We make the objection heretofore stated, on all the grounds as heretofore stated.

The Court: Same ruling.

Mr. Wittschen: Exception.

The Court: It may come in subject to a motion to strike and over the objection of counsel.

Mr. Wittschen: Exception.

The Witness: A. Mr. Bechtel had requested me to help Mr. Hindmarsh prepare data for another application for extension of time and if possible to prepare the data in a way which would not be controversial and would be sure of that time——

Mr. Wittschen: He is asked for a conversation.

Mr. Marrin: Yes.

Q. Just confine it to what you said.

A. I asked Mr. Boggs if he did not consider that the paving that would be necessary in the spring of 1936 would be a legitimate cause for time extension. He stated to me that he did consider it a legitimate cause for time extension.

Q. Was that all the conversation?

A. To the best of my recollection, that is the substance of the conversation.

Q. Mr. Price, I hand you a volume here, consisting of a number of charts. Will you explain to the Court what those are?

Mr. Wittschen: I thought you were not going to introduce them [1258] as an exhibit?

Mr. Marrin: I am not going to. I simply want to explain how it is made up, and what it is. I am

(Testimony of Thomas Moore Price.)

not going to offer it in evidence at this time, except to have it marked for identification, to enable the witness to refer to it for accuracy in his testimony.

Mr. Wittschen: Very well. I thought he was going to use it as a memorandum so he could tell with more certainty and refresh his recollection, without objection to it.

Mr. Marrin: Surely; but I simply want to have the witness explain to the Court how this is made up.

The Court: Q. Did you make that up?

A. It was made up under my direction.

Q. When?

A. Recently; within the last six months.

Q. Have you checked it? A. Yes.

Mr. Marrin: I will ask that that be marked for identification.

(The charts were marked "Plaintiff's Exhibit No. 58 For Identification.")

Mr. Tinning: What do you call it, Mr. Marrin?

Mr. Marrin: That is a composite progress chart; so that we can be clear on it, I will state what it is. It was made up from the records of the Company, and it shows the progress, in some places week by week, and other places day by day, of the excavations, of the drifts; and of the tunnels; and it also shows the progress in placing the concrete in the tunnels. I believe it also shows——

Q. Does it show the timbering, Mr. Price?

A. It shows the square setting.

(Testimony of Thomas Moore Price.)

Q. It shows what steel was placed?

A. Yes.

Mr. Tinning: So we will understand it, by "square setting," you refer to the braces that were set in the tunnel after the slides?

Mr. Marrin: Yes. It is a method of timbering which will be [1259] thoroughly explained by some other witnesses. This is simply a summary of the records of the Company on the facts; and it has been prepared for the convenience of everyone in referring to these things in testimony.

Q. Is that a correct statement, Mr. Price?

A. To the best of my knowledge, it contains nothing but facts; I don't believe it will be controversial in any respect.

Q. Well, to the best of your knowledge, it is accurate?

A. Yes, it is, to the best of my recollection.

Q. Mr. Price, to what distance were the tunnels excavated before the first concrete lining was poured?

A. The south tunnel was excavated to a distance of,—the circumferential drift,—of approximately 92 feet. The north tunnel was excavated approximately in the same manner, to a distance of approximately 110 feet.

The Court: Q. You heard Mr. Larson testify, did you? A. Yes.

Q. Did he give the details of the work and the figures accurately? A. Yes, I thought he did.

(Testimony of Thomas Moore Price.)

The Court: Proceed.

Mr. Marrin: If your Honor please, I do not intend to spend any time going into the details of this with this witness.

The Court: I want to give you the widest latitude, in fact, on both sides, as I indicated at the outset. I realize how important this is to both sides; and particularly this preparation of the digest. My only thought was: if there is any dispute as to the progress, or anything in those details, then it would become important; I think it would be conceded the progress that was made and the various charts were important. That is all I had in mind. You may proceed.

Mr. Wittschen: So your Honor will be clear: our objection on that was that they started to put in, on this progress, not only what [1260] they did, but what everybody else did who finished the job.

Mr. Marrin: No; that is not true.

Mr. Wittschen: Well, that was our objection.

Mr. Tinning: This is not controversial.

Mr. Marrin: Well, it is getting controversial when you make statements of that kind.

The Court: Now, you have been getting along so well around here, I don't want to do anything——

Mr. Wittschen: Well, let me finish this before you get excited. Our objection was to certain matters that Mr. Price has in his hand; if there is going to be controversy as to where they were at a particular point,—if they say in their record they were

(Testimony of Thomas Moore Price.)

here, and if we don't agree with it, we will say "in our records you were there." But I cannot see any necessity for that particular document going in unless the objectionable matters are eliminated; and that they promised to do.

Mr. Marrin: I might say, your Honor, when this was made up, the men in the office inadvertently put in the progress of the contractors who finished and who followed the Six Companies. The other side objected to that; and, during the noon hour, I tried to blank that out in this copy, and we intend to eliminate it permanently.

The Court: Well, for the Court's information, is there any controversy in relation to the progress of this work, as to the dates and the essential things which are important here?

Mr. Tinning: I do not think so, your Honor.

The Court: They have a record, and you have a record. Are you apart in relation to your record?

Mr. Marrin: Well, I don't think we are, your Honor; but unless we get something in the evidence, we have not anything in the record on it.

The Court: I can appreciate that. [1261]

Mr. Wittschen: Haven't you got this from Mr. Larson's testimony?

Mr. Marrin: Well, Mr. Larson was only there until April 30th.

The Court: I realize that.

Mr. Wittschen: Don't you intend to follow that with your other superintendent?

(Testimony of Thomas Moore Price.)

Mr. Marrin: Yes; but I want this witness to give some testimony; and he can give it much more accurately, with this before him.

The Court: Don't be misled by what the Court may do. I don't even suggest to you how you should present your case. I want to be helpful to each side. The thing I was concerned about was the repeating of testimony on things that are not really in dispute; and the repetition of that would not be helpful to either side. That is all I had in mind. I can understand this digest is taken from the original records. They are entitled to the original records, if there is anything in dispute; so, if we get too technical here, we will be here for the rest of the summer. We will take a recess for a few minutes.

(Recess) [1262]

Mr. Marrin: Q. Mr. Price, would you state how many drifts were used in excavating the tunnel on the west portal? A. 13 in each tunnel.

Q. When was the work of excavation resumed after the concrete was placed in the lining in the west portal? On what date was the excavation resumed in the tunnel?

A. It was resumed in the north tunnel on December 5, 1934, and in the south tunnel on November 26, 1934.

Q. Will you describe just generally the method of excavation used from that time, from the resumption of excavation in these tunnels up until August 21, 1935?

(Testimony of Thomas Moore Price.)

A. I will describe the south tunnel first. The first excavation was removing the core of dirt that had been left in place after the perimeter had been concreted. This was done with a power shovel and was excavated up within approximately 35 or 40 feet of the end of the concrete section where we found it necessary to stop the excavation because the dirt sloped on about that slope, about a 40-degree slope, I would judge, which exposed the underground section of the tunnel at the end and prevented excavating any more of the core left in the concrete lining; we found it necessary therefore to leave this dirt in the tunnel, this core in the concrete section at that point and proceed with the excavation of the tunnel at the end of the concrete. This was accomplished by driving a top heading at the top of the arch at the east end of the concrete, driving it in a few feet, 35 or 40 feet, winging that out with additional drifts, and so continuing on down the sides of the tunnel, removing the core as it became necessary or as we cut the top of the tunnel, until we reached the bottom.

Q. The purpose of leaving the core was for support?

A. Leaving the core to support the ground. We had no other support east [1263] of the concrete. The timber that was put in to hold this ground was an experiment on the part of the tunnel superintendent, Mr. Whitmire, at that point, putting in solid timber, in other words, the sets touched each

(Testimony of Thomas Moore Price.)

other, skin-tight, I believe is the tunnel name for it, and they were raked or inclined toward the hill. The pressure of the dirt at the end of the concrete section seemed to be westward toward the concrete, and he and I were both of the opinion if we inclined the timbers toward that pressure and made them solid, that we could hold that ground. That ground was quite muddy, and it was very soft for approximately three-quarters of the cross section of the tunnel. The bottom quarter had some decomposed sandstone in it, some rotten sandstone. As we advanced by this system approximately 40 feet we decided, Mr. Whitmire decided, and I agreed with him, it seemed to be a good plan to change the system and start the excavation at the bottom of the tunnel, driving the drift on grade, and letting the dirt in the side walls fall down to the drift rather than start at the top, as we had to start in the excavating, as far as we could in the concrete section, let the dirt fall down through the drift and then move it out; in other words, we would start with the grade drift, excavate anyway, and excavate the material out of the drift by means of a Bagley scraper; a Bagley scraper is a bottomless bucket. it is a bucket composed of two sides and an end, and as that is dragged over the ground by a power machine the weight of the bucket tends to dig into the ground and get a load of dirt, and it deposits the load immediately where the bucket is stopped, there being no front to it, and as the bucket is

(Testimony of Thomas Moore Price.)

dragged back to get another load it leaves it at that point, and that load is dragged out of the drift. They call it a Bagley scraper. This scraper is pulled by a hoist operated by compressed air. [1264] After the bottom drifts had been excavated a reasonable distance into the hill, 40 or 50 feet into the hill, a second drift was started on top of this, and the dirt dropped into the bottom drift, where it could be pulled out by the scraper to the face and loaded by a power shovel in the same manner as the previous drift, and so on the entire tunnel had been excavated by means of this drift going from one side to the other, and then timbered for a certain distance ahead, approximately 40 or 50 feet, at which time it was felt safe to remove the core. We had to keep the concrete that distance back of the most forward timber in the arch because the core would not stand on the very steep slope, approximately 1 to 1, to prevent ground from caving away into the timber, the same as it had in the concrete section.

Q. What do you mean by a slope of 1 to 1?

A. I mean 1 foot horizontal to 1 foot vertical, about a 40 or 45 degree slope. This method was continued in the south tunnel up to the time of August 21, 1935, with a few variations. Later on we took the hoists with the Bagley scrapers and mounted them on another kind of a jumbo, which consisted of an elevated platform on wheels, so that the hoist would be in line in the drift and high up above the muck cars, so that the cars could pass underneath

(Testimony of Thomas Moore Price.)

the location of the hoist, and also so that they could move forward into the tunnel as the excavation proceeded.

Q. That was the process used on the south tunnel? A. In the south tunnel, yes.

Q. How about the north tunnel?

A. In the north tunnel Mr. Larson wanted to try the wall plate method; he found practically the same condition in the core, at the end of the concrete section as I found, with the exception, I think, there was more of the sandstone in cross section there than there was in the south tunnel, and at [1265] the end of the concrete, as I recall, the mud only extended down that tunnel approximately one-third to one-half of the way and the remainder of the tunnel being in the sandstone formation; he drove a top heading drift in the same way, because it was the only way that the ground could be started forward and advanced down to the wall plate line, I mean by "advanced," he excavated on a circumference down to the wall plate line or the spring line, which is where the tunnel curvature started. He then set wall plates in these drifts and completed his coverage with the tunnel timbering, after which he started the excavation of the core with the shovel and set the plumb posts; as he excavated the core he found it necessary, however, in the beginning, to breast-board the place where the tunnel posts were set, because the core would not stand on a slope steep enough to let him set the plumb post

(Testimony of Thomas Moore Price.)

under the wall plates for quite a distance. He continued in this manner up to 112+52, approximately —I mean he started at station 112+53 and continued up to station 115+67.

Mr. Tinning: Q. Can you give the number of feet where you make that statement and it will save time on cross-examination. How many feet was it?

A. 314 feet, approximately. I might say that in making this chart the average of the core stations is used. With an inclined core it is very difficult to spot a point and say that is exactly the advance, but an average—the station is the average of the core advance. At that point we believe the ground to be better and moved the wall plate up higher to the top of the first segment in the arch. We both believed that the angle formed by the first and second segments in the arch to be a weak place, and we believed that the wall plate at that point would strengthen that weakness or tendency to push in at the junction of those two segments. That system was continued up to station 116+81, approximately 114 feet. [1266]

Mr. Marrin: Q. Mr. Price, can you obtain from that the date you arrived at the various stations?

A. Yes, I can.

Mr. Tinning: Q. When did you arrive at 115+67?

A. 115+67 was arrived at on March 25, 1935.

Q. 116+81?

A. 116+81 was arrived at on May 1, 1935.

(Testimony of Thomas Moore Price.)

The Court: And the next 114 feet?

A. That is the 114 feet I was speaking of.

Q. The first was 300 odd feet? A. Yes.

Q. And the next was 114?

A. Yes. At that point Mr. Larson was relieved from the job, and Mr. Whitmire was placed in charge of both tunnels. We decided that the ground conditions warranted a better handling if we returned to the typical normal wall plate method by driving the wall plate at the normal elevation, which is about the spring line of the tunnel, and the wall plate was consequently lowered at that point and the excavation continued with that method up to station 117+65 on approximately June 18, 1935, a distance of 96 feet, approximately. At that point, at station 117+65, the ground conditions had become so bad that I determined we should go back to the method we were then using in the south tunnel and had been used all along, which had been developed by Mr. Whitmire, and it was proving very satisfactory as far as holding the bad ground was concerned. So we went to that system in the north tunnel at station 117+65 on June 18, and continued with that system until the operations were shut down on August 21, 1935, at station 122+11.

Q. How many feet?

A. A distance of approximately 452 feet.

Mr. Marrin: Q. When you said the operations were shut down, you mean simply driving operations, don't you?

(Testimony of Thomas Moore Price.)

A. Yes, I mean the excavation operations, they were temporarily shut down.

Q. Were the driving operations shut down on August 21, 1935? A. Yes, they were. [1267]

Q. Why were they shut down at that time, Mr. Price?

A. When the excavation of the tunnels was started in the early part of December, 1934, I believed that it would be necessary to see what could be done with the ground before any plans could be made as to what the future procedure would be with respect to both excavating the tunnels and concreting the tunnels. I believed that the normal accepted practice of excavating and concreting would be the most economical and the most practicable method that could be used, namely, by keeping the tunnel open by some means, holding it open, so that your steel forms, movable steel forms, could be used to concrete the lining with in the normal manner. I believed that the worst ground which we would encounter had possibly already been encountered at the west portal, and that the ground would improve as we drove into the hill. I knew that the geological report, by the time we had gotten a short distance into the hill, indicated a better ground, and we hoped that we could hold that ground until we arrived at the point where the better ground was indicated, if we could open approximately 200 or 300 feet of the tunnel it would be better to hold it open in what I understood and believed to be the

(Testimony of Thomas Moore Price.)

worst ground in the whole hill, that the tunnel could be driven and concreted in a normal manner, as I have described. The tunnel was driven approximately 300 feet into the hill, which was completed about April 1. By that time we had been able to get the concrete system planned so that we continued driving, because it was my opinion that the ground would soon get better, because it was supposed to be the worst ground which we would encounter. Approximately sometime in May we went out of the sandstone section of the ground and got into the cherts formation or section, which was supposed to be good ground, and continued in that for the rest of the distance until the excavation was temporarily shut down on August 21. The ground at the beginning of this formation was very [1268] bad, in fact was much worse than the sandstone formation through which we had emerged. I felt, I thought that it must be the Wildcat fault which was spoken of, and which showed in the cross section on the geological report, and considered if we could drive through 90 or 100 feet of that ground that we would then be in the cherts formation which was supposed to be self-sustaining, and we would not have any trouble with the holding of that ground at all, that our worst ground generally laid behind us. The ground up to the beginning of the cherts, with the exception of two places in the north tunnel, one at about station 114 and one at about station 116+60, and all of the ground in the south tunnel had not

(Testimony of Thomas Moore Price.)

shown enough pressure on the timbers to cause the timbers to come into the area to be concreted, with the exception of a short distance right at the end of the concrete section, the section that was concreted in 1934. In the north tunnel those two places had shown pressure immediately after the timbers had been installed, but after we went back and installed additional timbers and put some braces in the movement ceased and no more movement took place. I was quite elated, therefore, when this condition maintained itself day after day without any pressure on these timbers on that first four hundred and some feet, and felt that our troubles were over, as far as holding the ground was concerned. However, along about the end of May, 1935, we had driven into the cherts some distance, and the timbers seemed to be moving, the movement seemed to be worse along the side wall posts, and in about June, the latter part of June, 1935, the pressure became so severe that several of these posts broke under the side wall pressure and several of them became bowed, and we found some places in the tunnel where the timbers were coming in constantly, so we put up cross braces and inclined posts and tried to stop the movement as we had stopped it in the Monterey section, in [1269] the sandstone section. This condition did not improve, and progressively became worse all during July and the early part of August, and I was considerably worried about holding the tunnels open. I had advice from

(Testimony of Thomas Moore Price.)

all concerned. I consulted constantly with the tunnel superintendent and talked to Mr. Bechtel about it, and I talked to Mr. Lawler about it, who came to the job practically every week, and who was somewhat my guiding star in tunnel construction, because I felt he had had more experience than anyone else I knew, and as a result of those conferences, and the timbers continuing to press in, I recommended that the tunnel be shut down, which was done on August 21, the tunnel excavation was shut down; also the concrete program had been late; we were delayed, I felt, through no fault of my own, and we were being required to leave the concrete forms set for 72 hours before moving them, which made the progress of the concrete slow after we had got started. We had not reached good ground, we had passed through what I thought was the worst ground in the sandstone formation, we had passed through what showed in the geological report, what was supposed to be the Wildcat fault, and we just kept getting worse ground and worse ground, and had not hit the cherts that was supposed to be self-sustaining, although we were two or three hundred feet in it, according to the cross section shown on the geological report, and it seemed to me the only thing to do was to shut the excavation down until we could protect it with concrete lining.

Q. Do I understand that at the time the excavation was shut down on August 21, 1935 the trouble with the timbers was in the cherts section?

(Testimony of Thomas Moore Price.)

A. Yes, it was.

Q. Which was at the forward end of the excavation?

A. Which was the last section we had excavated. [1270]

Q. Were you having trouble with the timbers in the first part of the tunnel you had excavated?

A. No, we had not had any trouble with those timbers, except shortly after the excavation was made the timbers intruded somewhat in the concrete section, right into the section to be concreted, right at the end of the concrete section, with the exception of two places in the sandstone where, as described, the timbers had also come in, but on which the movement had stopped.

Q. Mr. Price, I show you here a tabulation which is marked "North Tunnel Excavation Progress." Will you state what that is?

A. That is the excavation progress of the core of the north tunnel in weekly periods.

Q. Does it show from station to station?

A. Yes, from station 112+53 to station 122+11.

Q. I notice at the bottom of that it states "Distance between arch concrete lining and face of core excavation as of August 28, 1935 shut-down." Should that date be August 21?

A. It should be 21.

Mr. Marrin: May I correct that on the original?

Mr. Tinning: Yes.

(Testimony of Thomas Moore Price.)

Mr. Marrin: Q. Now, this tabulation, you might just show the Court, in the first column the stations in the north tunnel.

A. The distance from that station to that station.

Mr. Wittschen: Would you like to give it an exhibit number?

Mr. Marrin: We offer that as Plaintiff's Exhibit next in order.

(The tabulation is marked "Plaintiff's Exhibit 59.")

(Testimony of Thomas Moore Price.)

Q. Will you give us the distance through which these wall plates were driven from each end?

A. In the south tunnel—— [1275]

Mr. Tinning: Q. Do you mean this now before August 28th or after?

A. Well, August 21, 1935. The south drift in the south tunnel was started on May 8, 1935. The crossover was constructed and the north drift in the north tunnel was started on June 1, 1935. The station of the south drift in the south tunnel was—the first station was 140 plus 50 approximately. The station of the south drift in the south tunnel was approximately 139 plus 73.

On August 21, 1935, the south drift had been advanced to Station 131 plus 31, a distance of approximately 919 feet.

Mr. Wittschen: Will you read the answer of the witness?

(Record read.)

The Witness: A. The north drift of the south tunnel had been advanced from the crossover to Station 131 plus 30, a distance of approximately 843 feet. The south drift in the north tunnel was started at Station 139 plus 53, on May 6, 1935, and continued to Station 131 plus 41, approximately, on August 21, 1935, a distance of 812 feet. The north drift in the north tunnel was started at the crossover on June 23, 1935, at Station 138 plus 80, approximately, and continued to August 21, 1935, to Station 132 plus 23, approximately, a distance of

(Testimony of Thomas Moore Price.)

approximately 657 feet.

Mr. Marrin: Q. Were those distances of the wall plate drifts through to the excavation in the west portal?

A. No; not at that time.

Q. Was the excavating on those drifts stopped at the time the excavating in the west portal was stopped? A. Yes, it was.

Q. Why was that?

A. The west portal excavating, up to that time, as I explained, had not advanced with the progress which we had hoped to the distance between the two headings; and progress from the west and from the east was so hard that I feared that the penetration of the supposed contact line between the Orindan formation [1276] and the cherts formation might be productive of a lot of water; and we would reach conditions that had been somewhat similar to the conditions that we had reached in the west excava-

Distance between arch concrete lining and face of core excavation as of Aug. 21, 1935, shut-down ..... 898 Ft.

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Plff's Ex. No. 59. Filed April 28, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

(Testimony of Thomas Moore Price.)

Q. The first column of Exhibit 59 shows the stations in the tunnel? A. Yes.

Q. And the second column shows the period or the date in which the [1271] excavation occurred?

A. Yes.

Q. And the third column shows the number of feet of excavation of the core during the week shown in the second column? A. Yes.

Q. I show you another tabulation headed "South Tunnel Excavation Progress." Does that show the same data for the south tunnel?

A. Yes, it does. That also should be August 21 instead of 28.

Mr. Wittschen: Are you putting those in as one or two exhibits?

Mr. Marrin: Perhaps we had better make them two exhibits. I offer the second one as Plaintiff's Exhibit No. 60.

(The tabulation was marked "Plaintiff's Exhibit 60.")

(Testimony of Thomas Moore Price.)

Distance between arch concrete lining and face of core excavation as of Aug. 21, 1935, shut-down				1,106

[Endorsed]: U. S. Dist. Ct. N. D. Cal. No. 20101-R. Plff's Ex. No. 60. Filed April 28, 1938. Walter B. Maling, Clerk. By J. A. Schaertzer, Deputy Clerk.

I am changing on the face of this in pencil the date from August 28 to August 21.

Q. How was this prepared?

A. This was prepared from original records which we have in the office files, and which form the basis of these documents, here.

Q. And you have checked those?

A. Yes, I have.

Q. And to the best of your knowledge and belief they are correct? A. Yes.

Q. Referring to this tabulation, Plaintiff's Exhibit No. 59, will you state how far the north tunnel had been excavated at the time the excavation

(Testimony of Thomas Moore Price.)

work was shut down on August 21, 1935? That shows excavation beyond the concrete, does it not?

A. Yes.

Q. Will you state how far that had been excavated beyond the concrete on that date? Doesn't that show at the bottom?

A. I was going to subtract the stations, and that would give it. I believe that is the distance, about 898 feet.

Q. Referring to Exhibit 60, the distance is how much? A. 1106 feet.

Q. Now, Mr. Price, was any work done on the east portal of the tunnel? A. Yes.

Q. Will you state what is was?

A. Along in April, 1934, it became [1272] quite apparent that we were not being able to maintain our proposed progress schedule.

Q. April, 1935, you mean?

A. April, 1935, I mean, not 1934, and I believed that it would be practicable to do some work at the east portal for several reasons, the east portal being over a hill from the west portal, it was not practical to use the same plant at all to serve it, to either excavate it or service the job, and I recommended that we build a small plant over there which would supply compressed air and the other necessities for excavating wall plate drifts. I thought it would be advisable to do this from the east portal rather than do it from the west portal, because such an operation should be an operation in itself, and would confuse the work on the west

(Testimony of Thomas Moore Price.)

end, where we were advancing the tunnel by excavating all of the excavation that was to be done in the tunnel—I believed if we could drive wall plate drifts through the west portal to intersect with the operations—I mean from the east portal to intersect with operations from the west portal, that that would have several advantages; it would eliminate all drift work that was being done, that would be done at the west portal in driving the drift as we advanced, and the core was made. I was sure that very soon we would reach ground where we could use at least a wall plate drift system, and if these drifts had been constructed through the hill by the time we reached that ground that progress would be much more rapid and that we could make a much sooner completion of the job; and also these drifts would open up the tunnel, would ventilate the air better, and give us a chance of escape from the regulations respecting the explosive gases in the tunnel, by ventilating it better and giving access at both ends. I consulted with every one of the members of the Six Companies regarding this plan, and Mr. Bechtel, and with the tunnel superintendent, and we all agreed it would be a proper plan to do. [1273] The excavation was started in the early part of May, 1935, and was continued until the shut-down of the excavation work on August 21, 1935.

The Court: If that was a good plan, a good method in May, 1935, why wasn't it in 1934?

A. We did not know the condition of the ground would require it.

(Testimony of Thomas Moore Price.)

Mr. Marrin: I would like to offer in evidence the poster which is on the easel as Plaintiff's Exhibit 61.

(The poster was marked "Plaintiff's Exhibit 61.")

Q. Drawing your attention to Plaintiff's Exhibit No. 61, Mr. Price, will you explain what that illustrates?

A. This illustrates the wall plate drifts as they were driven from the east and their approximate cross section. These dotted lines represent the approximate outside of the permanent concrete that was supposed to go into the tunnel.

Q. By these dotted lines you mean what?

A. These dotted lines.

Q. The perimeter?

A. Yes. The wall plate is shown at this point in the lower left-hand corner of the left-hand tunnel and the lower right-hand corner of the right-hand tunnel.

The Court: About how many feet would that be from the bottom of the floor?

A. That would be approximately 15 feet from the bottom of the floor of the tunnel to the bottom of the drifts; the drifts were, as I recall it, 9 or 10 feet high and there was approximately 10 feet above that to the top of the finished tunnel.

Mr. Marrin: You are referring to the longitudinal section of the tunnel on plaintiff's Exhibit No. 61?

(Testimony of Thomas Moore Price.)

A. Yes. At the top of the poster this shows the spacing in each tunnel, the upper tunnel being the north tunnel and the lower one the south tunnel, this being the west portal at the left and the east portal at the right. The heavy black lines on this portion of the poster represent two wall plate drifts in plan as they were driven from [1274] the east portal westward to intersect with the other work that was advancing from the west toward the east. This cross-over section here indicates that this south drift of the south tunnel was driven in first and then a cross-over driven to drive the north drift of the south tunnel and the same way in the north tunnel.

Q. Why was the cross-over driven?

A. This portal was in very bad ground and it was difficult to get a face that would stand vertical long enough to enable us to get underground even with a small drift; we would excavate and re-excavate, and have ground there which continually came in, and I felt it would be better not to expose too much of it until all had been excavated; it was absolutely necessary to make a face for the men to work there.

Q. The black lines on the longitudinal section of the tunnel running in from the east portal represent the distance through which the wall plate drifts were driven in each tunnel?

A. Yes. That is starting at station—I can give it more accurately from my other data.

tion; and that being driven on a downward grade of 4 per cent, I feared that opening up much water there might be a disadvantage to the drifts, as constructed; and I did not want to go any further and tap that supposed contact line between the two formations.

Q. You say the drifts were on a 4 per cent grade?

A. Yes.

Q. Was the highest part of the drift toward the portal?

A. Yes; the highest part was at the portal. They were being driven downhill.

Q. How was water removed from the drift?

A. By pumping.

Q. You were driving through the Orindan formation? A. Yes.

Q. The water would have an adverse effect on that formation?

A. Yes. It did; very much water in the bottom of the drift; it was a very muddy—as soon as water touched the Orindan at all, it became very muddy; and, in the bottom of the drift, it was almost impossible to walk through it unless you were very sure-footed; in fact, the water seemed to cause the Orindan to disintegrate very fast and work down into mud.

Q. Was any of the ground through which the tunnels were excavated up to August 21, 1935, self-supporting?

A. No, sir; I don't think so.

Q. Did it all require permanent timbering?

(Testimony of Thomas Moore Price.)

A. All required heavy timbering.

Q. If the ground through which the tunnels were being excavated had been self-supporting, could the excavation have proceeded at the same time as the portions of the tunnels which were excavated were being lined with concrete?

A. Yes.

Q. Will you explain that?

A. If we had ground that would be self-supporting, the ground which had not been self-supporting would soon be caught up with concrete, and the ground that would be self- [1277] supporting would not give any trouble, would not delay the operations at all. That was why we had to quit: was because we could not find any ground that was self-supporting.

Mr. Marrin: There was introduced as Defendant's Exhibit "HH," a construction schedule of February 5, 1935. I would like to have it. I may have the wrong number.

The Court: While you are checking up on that, we will take an adjournment until tomorrow morning at ten o'clock.

(Thereupon, an adjournment was taken until Friday, April 29, 1938, at 10 o'clock a. m.) [1278]

(Testimony of Thomas Moore Price.)

Friday, April 29, 1938.

THOMAS MOORE PRICE,

Direct Examination (Resumed).

Mr. Marrin: Q. Mr. Price, I show you Plaintiff's Exhibit 3, which is the specifications for the construction of the project of the defendant, and I will ask you if there is any provision in the specifications dealing with the disposal of the muck or material from the tunnels. A. Yes.

Q. Would you read those to us, please, giving the page and the section number from which you are reading?

A. Under Section 32, sub-heading 5, on page 59, in the left-hand column of the specifications it states:

> "Material excavated from the tunnel section shall be used to make embankments as provided under Section 8, 'Grading' of these specifications, and all operations in placing such material in fills or embankments shall conform thereto; provided, however, that any material which in the opinion of the District Engineer is unsuitable for use in embankments shall be disposed of at the expense of the Contractor in a manner satisfactory to the District Engineer; and provided further that material in excess of that required for embankments and for which, in the opinion of the District Engineer, there is no practicable use on any part of the work, shall also be disposed of by the Contractor at his own

(Testimony of Thomas Moore Price.)

expense and in a manner satisfactory to the District Engineer.

"Material excavated from the tunnel section and required to be used in the making of embankments will be used only on the highway west of the West Portal, and it is contemplated that all tunnel excavation which is suitable for the purpose will be used to make necessary embankments on this section of the highway. No provision has been made for using any such material on the Northeast [1279] highway approach and none shall be placed thereon unless the District Engineer so directs.

"Where excavated material is used for embankments on any part of the work the Contractor will be allowed 'Overhaul' as provided in Section 8, 'Grading' of these specifications, with the following modifications thereof.

"No payment for 'Overhaul' will be allowed for the distance material is transported within the limits of the tunnels, but haul will be measured from the Station of the Portal of the Tunnels, as shown on the plans, and the provisions for free haul of five hundred feet (500') shall apply to any distances material is required to be transported beyond such Portal Station. Overhaul will not be paid where unsuitable or surplus material is required to be disposed of by the Contractor at his own expense."

(Testimony of Thomas Moore Price.)

That refers back to Section 8 of these same specifications, Section 8 beginning on page 11, but the portion I wish to refer to is on page 12, entitled "Embankment," and the subheading under that entitled "Compacting." It has a (b) in front of that word, on the right-hand column of page 12:

"Except as otherwise specified herein embankments shall be constructed in layers not exceeding eight inches (8") in thickness. The sides of the fill shall be placed first and the center shall be carried up lower than the sides. Each layer shall be thoroughly compacted by rolling with a twelve (12) ton three-wheeled power roller or with a tamping roller, the outer surface of which shall be studded with teeth not less than seven inches (7") long and having a surface area of approximately four square inches (4 sq. in.) each; the roller shall be of such a weight that the load upon each tooth will not less than three hundred pounds (300 lbs.). Unless the material when placed in the fill is moist [1280] enough to be properly compacted, each layer shall be watered sufficiently to dampen the material before being rolled. Successive layers shall not be placed until the layer under construction has been thoroughly compacted.

"Embankments built of rock or rocky material shall be constructed in layers from eight inches (8") to not more than eighteen inches

(Testimony of Thomas Moore Price.)

(18") in thickness, and watered and rolled thoroughly with a three-wheeled power roller weighing not less than twelve (12) tons. The use of tamping or sheepsfoot rollers will not be permitted for compacting layers over eight inches (8") in thickness. The thickness of the layers of the material containing large rock shall be the minimum which the size of the rock present in the material will permit, but in no case shall the thickness of the layers exceed eighteen inches (18"). The Contractor will be required to break up oversize rock with sledges or otherwise to make the layers conform to the maximum allowable thickness."

I believe that is all that is pertinent to that.

Q. Now, Mr. Price, referring to Defendant's Exhibit P, which is on the easel, will you step down here and point out to the Court where the fills are located in which these specifications provided the tunnel muck must be placed?

A. This is Oakland, at this end, or the westerly end of the tunnel, and this is the approach leading to the tunnel. This dotted line through the hill represents the tunnel to be constructed, and this is the east portal or the northeast section of the highway, as to which I just read the specifications, which extended beyond the tunnel for approximately 1000 feet or so, not very far. The fills referred to in the specifications are the fills immediately adjacent to

(Testimony of Thomas Moore Price.)

the west portal, approximately a distance of half a mile, I would say. The tunnel ascended steadily, this was approximately 5 per cent. [1281] grade, I believe, compensated somewhat up to the west portal of the tunnel, and the tunnel, itself, was on a 4 per cent. grade still ascending, the highest point reached on the highway traversing the hill was approximately four or five hundred feet east of the tunnel; the road still ascended after passing through the tunnel before the summit was reached on the highway, it was conclusive to me that the specifications providing therefor that the material move through the tunnel westerly to go into these fills, and not over the hill to the fills, that is, they are high hills of steep winding grade--by "steep" I mean approximately 6 or 7 per cent., it made it impracticable to haul any muck from the east portal over the hill into the fills.

Q. Was any fill provided at the easterly portal of the tunnel?

A. There was a small amount of fill, but there was also some excavation there that would amply take care of that fill.

Q. That is the excavation for the east portal building?

A. The excavation for the east portal building, and the road up to it.

The Court: Tell me, was there enough in the core of this tunnel to take care of the fills on either end, or both?

(Testimony of Thomas Moore Price.)

A. Yes, there was approximately 170,000 yards of excavation, according to our engineers' calculations.

Q. I am not good going on yards, tell me generally.

A. I will just give you that approximately 170,000 yards required, and the neat measurement was approximately 207,000 yards; in other words, there was approximately 37,000 to 40,000 cubic yards more than, apparently more than enough to do that fill, if there were no over-break in the tunnel, that is the neat measurement.

Mr. Marrin: Q. What do you mean by an overbreak?

A. If there were no larger section than the actual section required by the specifications. [1282]

Mr. Tinning: Q. What figure did Mr. Price give as the neat measurement of the tunnel?

A. I think approximately 207,000.

The Court: Don't take advantage of what I have in mind.

Mr. Tinning: No, I was interested in the figure.

The Court: I have heard so much about fill, I wanted to know if there was enough to take care of the fill on both ends or either one of them. You say there was? A. Yes.

Mr. Marrin: Q. There was, Mr. Price, if the District Engineer would permit the use of all of that—I say there was sufficient fill if the District

(Testimony of Thomas Moore Price.)

Engineer would permit the use of all of the material taken out of the tunnel for the fill.

A. Yes, I understood there would be sufficient material. However, soon after I came on the job I realized there was going to be some larger sizes than would be needed in the fill, than was permitted by the specifications.

Q. Why could the larger sizes not be used?

A. It would be impracticable to put them in the fills and break them up and down to 18 inches, to make an 18-inch layer; in making an 18-inch layer, a maximum layer of 18 inches in a fill it is very difficult to get a rock which is much more than 12 or 15 inches in diameter to maintain the maximum thickness.

Q. As I understood from your reading of the specifications, the fill was to be laid in a layer 18 inches thick. A. Yes.

Q. And then that was compacted?

A. Rolled, compacted.

Q. And for that reason the large rocks out of the tunnel could not be used?

A. It was impracticable to use them, and for that reason I changed somewhat the system that has been discussed.

Q. I just want to ask you one question about this exhibit, I do not want to criticize the exhibit, gentlemen, but this exhibit P is apparently supposed to show a cross section of this range of [1283] hills——

Mr. Tinning: You are supposed to look at the

(Testimony of Thomas Moore Price.)

hill from a view above and to one side, and it does not really represent a cross section. It is not an architectural perspective drawing, but only a diagram.

Mr. Marrin: Q. There is, however, a range of hills running straight through here on a higher elevation, is there not? A. Yes.

Q. So that there is no valley here, or access from the easterly end of the tunnel to the west?

A. No.

Mr. Tinning: There is a spine or backbone of the hill that runs north and south, and that is what the tunnel is through. If there was a valley we would not have built a tunnel.

Mr. Marrin: Q. If anything were taken from the easterly end of the tunnel and placed on the fills in the westerly end it would have to be hauled up over the road and over this hill, would it not?

A. Yes, it would have to go up the road and through the old highway tunnel, which was open at that time.

Q. Could you give approximately how far that would have to be hauled if that were done, a rough estimate?

A. I would say approximately two miles, with the winding in the road; that is purely an estimate, however, I have not measured it.

Q. That would be a very expensive operation?

A. Yes, it would be rather an expensive operation.

(Testimony of Thomas Moore Price.)

Q. Will you describe what arrangement you made for placing the material from the tunnels into these fills to the west?

A. When I arrived on the job in September there was a railroad leading down from the tunnel to the fill on the approximate grade of the finished road, I think possibly 5 per cent., but there was no provision for making any selectivity of the material out of the tunnel with this railroad. So I threw the railroad to the opposite [1284] side of the valley.

Q. By "threw" you mean you changed it?

A. Yes, I changed it to the opposite side of the valley and built a bin from which trucks could haul the material which would be suitable to make the fills. The material was hauled from the tunnel by means of four-yard muck cars, dump cars, and all of these cars passed over the top of this bin, and any material that was unsuitable, any car that contained any rocks that would be of a size that would be unsuitable to the fill was run on down the fill and dumped off and wasted on private property, largely. By this means I was able to get a rough segregation of the materials without screening it or any other segregation of materials to go into the fill, and generally maintain a material in the fill that was acceptable. I did not know at the time how much of this material would be needed or would be wasted in this fill, or would be required to be wasted by some other decision of the District Engineer; as a matter of fact, I do not recall the District

(Testimony of Thomas Moore Price.)

Engineer ever deciding against any particular material, with the exception that he did not want Orindan material, as I understand it, on the top of the fill. This was one of the reasons, I might say, why it was impracticable to take any more material out of the east end than was absolutely required in order to save the material, as much as possible, for the west approach.

Q. Was there any necessity for completing the fills early in the work?

A. Yes. I felt there was an urgent necessity for completing the fills as soon as possible, because after they had been completed it was necessary to pave them, and if we had not gotten these fills completed early in 1935 it would be necessary for them to go over until the spring of 1936, and with the provisions of the time limit set up by the contract it would not be proper [1285] weather, there would not be proper weather prior to May, 1936, which would permit the completion of the work, and for that reason I was anxious to get all of the material I could into these fills as fast as possible.

Q. Mr. Price, I think you were here when Mr. Larson testified concerning the concrete plan that he contemplated, were you not? A. Yes.

Q. You heard his testimony with respect to that? A. Yes.

Q. When did you first learn of the plan for concreting the tunnel?

(Testimony of Thomas Moore Price.)

A. Immediately after I came on the job in the latter part of September, 1934.

Q. You gave this study at that time?

A. Yes, I did as soon as I arrived.

Q. Did you read the provisions of the specification with respect to the concreting?

A. Yes, I read them and had quite a discussion about them with Mr. Larson.

Q. Did you believe from reading the specifications that Mr. Larson's plan was practicable?

A. Yes.

Mr. Wittschen: He should not be called upon to pass upon the plan of somebody else. You can ask him what he did.

The Court: I think he is going on the suggestion that I probably made, namely, the necessity of not going over the details of Larson's testimony unless there is a dispute about that.

Mr. Marrin: Yes, I did not want to cover a lot of detail if I could avoid it.

The Court: Proceed. It will not help us very much to have one man approve another man's work.

Mr. Marrin: It is more or less preliminary, it is leading up.

The Court: Proceed.

Mr. Marrin: Q. Would you point out the provisions of the specifications upon which you based that belief?

A. I refer to [1286] Section 32 of the specifications, entitled "Concrete Lining."

Q. Would you read it?

(Testimony of Thomas Moore Price.)

A. I was wrong about that being entitled "Concrete lining." It is entitled "Tunnel Construction" with a subheading "Concrete Lining."

Q. On what page?

A. On page 61, subsection "Concrete Lining," entitled "Description":

> "6. Description. The concrete lining for the tunnels shall consist of the concrete arch ring as shown on the plans, with steel reinforcing as designated or as otherwise directed by the District Engineer.
>
> "The thicknesses of concrete shown are minimum thicknesses, and the attention of the Contractor is directed to provisions hereinbefore set forth in this section, requiring additional concrete as made necessary by the methods of excavating, timbering, or otherwise supporting the excavation.
>
> "7. Materials. Concrete for lining shall be Class 'B' concrete, as provided in Section 13, 'Portland Cement Concrete,' of these specifications, and the provisions thereof and the provisions contained in Section 15, 'Concrete Structures,' shall apply to all concrete in tunnel linings except as modified herein. Grouting shall be performed as elsewhere specified in these specifications."

This comprises the extent of that section on concrete lining of tunnels and refers back to Section 15 of the same specifications.

(Testimony of Thomas Moore Price.)

Q. Is that on page 25?

A. Page 25, Section 13, under the subheading, "Placing Concrete."

> "Concrete for the tunnel lining shall be placed continuously between any two (2) adjacent construction joints, in lifts not more than six feet (6′) deep, measured in a vertical direction. The topmost lift, having a width not to exceed eight feet (8′), shall not be placed until the adjoining concrete on both sides [1287] has been in place for at least seven (7) days, unless otherwise directed by the District Engineer.
>
> "All concrete shall be used while fresh and before it has taken an initial set. Concrete shall not be used after more than thirty (30) minutes have elapsed from the time water was first brought into contact with the cement."

on the same page, under subheading 12, it states:

> "Concrete shall be deposited in uniform horizontal layers, not deeper than twelve inches (12″), care being taken to avoid inclined planes or inclined construction joints. Construction joints must be built with square ends and level tops, except as otherwise directed by the District Engineer; in arch type structures, joints shall be made at right angles to the axis of the rib. Each layer shall either be placed before the previous layer shall have taken its initial set, or, if the previous layer

(Testimony of Thomas Moore Price.)

has taken its initial set, the surface of the previous layer shall be prepared as herein specified for the preparation of hardened surfaces."

I would like to read the two paragraphs immediately preceding that also on the same page.

Q. What page is that?

A. Page 25, Section 15:

"Concrete shall not be permitted to fall from a height greater than six feet (6'), except through an enclosing pipe, in which case the height of fall shall not exceed twelve feet (12'). An enclosing pipe may be required by the District Engineer for placing concrete in columns, walls and deep footings.

"Concrete shall be uniformly distributed during the process of depositing and in no case after depositing shall any portion be displaced in the forms more than three feet (3') in a horizontal direction. Care must be taken not to displace the reinforcement, pipes, anchor bolts or other devices which are to be embedded in the concrete." [1288]

Q. Now, at that time were you familiar with the placing of concrete in tunnel lining by the pneumatic gun method?

A. Yes, I was reasonably familiar with it.

Q. Would you mind stepping to the board and diagram briefly the method which had been used to your knowledge in placing concrete in tunnel linings by the Hackley gun method?

(Testimony of Thomas Moore Price.)

The Court: We will take a recess for a few minutes. [1289]

(After Recess)

Mr. Marrin: Q. Mr. Price, you have made a drawing on the board. Will you explain the methods which, in your experience, have been used in placing the concrete with the Hackley Gun?

A. This is a rough representation of the tunnel, looking at it from the side. This is to represent it as looking at it from the end of the tunnel. This would be the area to be concreted. The forms would be here, the inside line of this section on the right-hand side, and the material through which the tunnel was driven, with temporary support, would be this outside line; the concrete lining to be filled, the area between the forms, and between the outside of the tunnel excavation. This is a longitudinal section, and I have attempted to illustrate a section of the concrete that has already been poured. I could not show it all here; but it extends from here up to here. This line here would be that line there,—about like this. This is intended to represent a pneumatic gun of some description, and this is a discharge pipe from the gun which is generally placed so it has the least curvature possible for concreting, and the concrete to be pushed by compressed air up through this pipe and into the forms.

The general practice of pneumatic equipment, so

(Testimony of Thomas Moore Price.)

far as I know, and I believe yet, in placing concrete in tunnels, is to put the material in as fast as possible. In other words, that should be done with any concreting system, because, in my experience, the best concrete is a concrete that is placed the fastest, so there is less chance to get what we call "cold joints." Particularly with a pneumatic system gun, the concrete should be shot in to a mass of concrete that is obtained at the end of the pipe; that is necessary, by the fact when a pneumatic gun discharges concrete it has somewhat of a tendency to segregate the mortar from the rock particles that make up the concrete; and, shooting that into a mass of fresh [1290] concrete, tends to remix that and make it a more homogeneous mixture. The general practice is to shoot your concrete and let it fall over the sides of the forms, down to the bottom, and let it stop at the bottom, like this,—the concrete running down these inclined layers as fast as possible, on one side, then on the other side. It is true it roughly makes layers; and my understanding of the particular paragraph referring to concrete tunnel concrete was the elevation between these two layers, the vertical distance between the lifts, as the engineer calls them; he said it should not exceed 6 feet. If you shoot concrete with a pneumatic gun into the form, into a mass of fresh concrete, there is no danger from falling concrete; it hits that soft mass and absorbs the blow, and protects the men who work back of the concrete in the

(Testimony of Thomas Moore Price.)

forms,—inside here,—in vibrating it or anything else that is necessary. I have not got this drawing quite long enough; but, as that fills up, the usual plan is to withdraw this whole arrangement,—the pipe and the pneumatic gun—put it back into the tunnel further; the layers of concrete built up until at last there is only a small opening here. When the pipe is pulled out to the edge of the form, and the concrete dumped into it, as much as possible, before it is finally withdrawn and the hole closed up——

The Court: Q. How many feet is that from the floor to the ceiling?

A. Well, I would say approximately 30 or 32 feet, I believe, in the Broadway Tunnel.

Q. The specification says something about a limit of 6 feet?

A. That was the point I wished to bring out. I did not think the specification, because of the paragraph set aside for tunnel concrete, referred to concreting in the tunnels. I knew we had been doing that on the outside concrete. We had been pouring concrete for six months, at least—well, not six months; but considerable concrete [1291] had been poured, and we had adhered, so far as I know, rigidly to those specifications which required concreting to be placed, put in half of the form over 3 feet and not over 6 feet; but in view of the fact the Engineer had set aside this paragraph specifically on tunnel lining, I assumed that was a modification of the——

(Testimony of Thomas Moore Price.)

Mr. Wittschen: Your Honor, there is nothing in the notice of rescission that says they rescinded because the concrete was required to be placed in a certain way, and that the Engineer made the interpretation of the specification in such a way that they were either delayed or misled by that; and, while it is very interesting to know how they laid the concrete in the tunnel, and I have no particular objection to it, it is wholly immaterial.

Mr. Marrin: I think it is very material. The plaintiff had before it, at the time it bid, these specifications; it did not have the benefit of the Engineer's interpretation of it at that time, or the interpretation he was going to place upon them. It was necessary for the plaintiff to plan a method of placing concrete which it believed would be permitted by the specifications and which was in accordance with the usual practice in placing tunnel linings in other projects; and the plaintiff went ahead and made its plans based upon that interpretation of the specifications. It developed later, because of the Engineer's interpretation of the specifications, that this method could not be followed out practically, and it was necessary at that point to make a radical change in the method of placing the concrete in the lining of the tunnel, and that caused a considerable delay in placing the concrete. It is those facts we desire to bring out.

Mr. Wittschen: Section 15 of the specifications says: [1292]

(Testimony of Thomas Moore Price.)

"Concrete shall be deposited in uniform horizontal layers, not deeper than twelve inches (12″), care being taken to avoid inclined planes or inclined construction joints."

And those are inclined planes; they are not horizontal. I am reading from page 25. Assume that everything Mr. Marrin says is true: what difference does it make? They did not make any claim they were misled; they did not say, "We don't want to do it." They did not say, "We are going to walk off the job," and they did not rescind on that ground; they rescinded for something entirely different; and all the details of their various motions in building the tunnels are wholly immaterial. This case will have to be decided, as I view it, upon the reasons stated in the notice of rescission; and this is not one, and neither is there any other claim, in writing or otherwise, objecting to the Engineer requiring them to lay it horizontally.

Mr. Marrin: Of course, while that section is in the specifications, Mr. Wittschen, there is also another specific section that says that concrete for tunnel lining shall be placed continuously between any two adjacent construction joints, in lifts not more than six feet (6′) deep, measured in a vertical direction,—specifically referring to tunnel lining.

As to materiality, this evidence, if your Honor please, goes to the question of time. If the work was delayed for causes which were beyond the control of the Contractor, then it is our contention the Con-

(Testimony of Thomas Moore Price.)
